Seven were employed by the day-care center, which was funded by the appropriate state and local agencies. Eight found other work. Then the mothers at the day-care center and others who had not found work started to cook food for take-out orders. These take-out foods were an immediate success; the demand was greater than the supply. At this point the mothers came to see us.

There was a vacant luncheonette for rent in their neighborhood. We put up all the funds required to start the restaurant proposed by the women. It specialized in "soul food," which was

especially popular with the people who live in that area. The mothers working at the restaurant remained on relief and drew no pay until the business was doing a volume sufficient to support them. We forecasted a period of about eight weeks for this volume to materialize. But business was so good that within three weeks the receipts were running nearly three times those expected. The business continues to thrive.

What an appropriate way for small capitalists to get started. In a case like this the investors know their funds will be used to establish the business, but not to support an overhead of payroll until the firm can make it on its own. The welfare authorities, on the other hand, continue to support the would-be entrepreneurs during the time they are building something that will eliminate the need for public support. I hope we can duplicate this procedure many times over.

Education is crucial

Much of the frustration that undoubtedly results in the militancy and revolutionary fervor of many educated blacks can be traced to their inability to achieve anything meaningful despite their aspirations. After the Civil War and after World War I their hopes rose but their achievements did not. Again today, after the passage over the last eight years of sweeping civil rights legislation, the blacks have had their hopes built up only to find that they are still excluded from decision making at important levels. They still do not have the means for exercising an entrepreneurial spirit.

Indeed, with industry turning more and more to automation, with the widespread use of computers, and with the development of sophisticated techniques, the disadvantaged of our urban centers find it more and more difficult to prepare themselves for any kind of satisfying participation in significant affairs. We seem to have failed to develop adequate public schools in our urban centers. Up to about 15 years ago, the working class could sell its muscle with only a low degree of skill or specialized training being required. Now employment of this kind is growing less and less available. But we have taken only a few of the necessary steps to provide the required schooling facilities.

If members of the disadvantaged class are to be given the chance to work toward better positions, schooling must be considered an absolute essential of the process. A negative income tax and massive direct support would undoubtedly be very helpful. However, they would not provide for the acquisition of capital or help directly to establish a climate conducive to it. Know-how is required for that—and know-how requires education.

Conclusion

There have been enough conferences and meetings. We know right now all we need to know about the problem of developing entrepreneurship in the economically disadvantaged areas of our urban centers. Now there is just one great big pile of work to get on with.

Helping small businesses in these areas to get started and to prosper is no cure-all. It will not directly improve health standards, schooling, or housing. What it can and will do, if practiced broadly, will be to provide a significant number of deserving and aspiring individuals with the opportunity to try their hands at the capitalist game.

Those who would practice giving this help as investors and advisors should be the very ones who have themselves prospered as players in the capitalist game. It is true they will have to bend some of the rules a bit to fit special circumstances. But not very much bending is necessary. Moreover, the ghetto entrepreneurs themselves will be stronger and better qualified to "go it alone" if they are coached soundly and realistically.

Any program that would isolate small business in the ghetto or separate it from the mainstream of business affairs will fail. Any effort to donate capitalism ready-made must also fail. The best economic tool we have ever had is good, old-fashioned, no-nonsense capitalism. It is up to those of us who have learned it and prospered from it to pass it on to those who would use it if they could but learn how. Repeatedly, in the past, people succeeded and prospered if help was available when they needed it. It is time now for all of us to extend helping hands to our disadvantaged citizens.

STARTING A SMALL BUSINESS
AN INTRODUCTION

Going into business is a very important step. While the opportunity to increase your income and to be your own boss can be extremely attractive, the risk of losing all your savings and investments or incurring debts requiring years to pay off is real. The importance of realistically appraising your chances of success cannot be overemphasized. Having a sound, creative idea for a new business simply is not enough--it is a good beginning, but it by no means guarantees success. Do not get carried away with the potential of an idea. The market place has a way of destroying creative ideas or taking them away from their creators.

The vast majority (over 80%) of new businesses begun in America every year fail within twelve months. Most of these businesses are started by people who are well acquainted with the businesses they go into, but they cannot make it. Generally, they fail due to competition, under-capitalization and/or poor management.

Competition. American business today is largely big business. Conglomerates--large diversified corporations --make it extremely difficult for new small businesses to succeed. Retailers not only own a number of stores, but also own warehouses, wholesale outlets and, often, trans-

portation companies and manufacturing sources. They can squeeze out competition from the "little man" by reducing prices and taking losses at the consumer end that he cannot. They can undercut him by paying less for wholesale goods or transportation. Further, they have money to spend on advertising that he does not and can "out market" him. There are many types of businesses that are bent on keeping out the smallest competition.

Undercapitalization. Some business advisors recommend that a person going into a new business should figure out the total he will need and double it in order to have enough. Others recommend simply assuming no income for twelve months when figuring the total need. Neither rule-of-thumb is accurate, but their point is that one seldom foresees all the costs which will be incurred. Tax laws are so complicated Internal Revenue Service strongly suggests no businessman try to run his business and keep his own books. Anyone going into business needs the services of a reputable accountant or economist to help him plan his capital requirements.

Poor Management. The two ingredients most important to a bank or lender are capital and management capabilities.

Generally, the new businessman is expected to have had previous management experience in the business he is entering. The less experience, the more money of his own he is often required to put up. The reason for this is the difficulty of successfully competing with those already in business.

WHERE TO BEGIN

There is no one-stop service center for new businesses, unfortunately. At a minimum, you can expect to need to go to three sources for help: financial, legal and for want of a better word, managerial. The financial resources should almost always be the last place to go. Virtually all lenders require business projections of some type and personal financial statements of the loan applicants. The best beginning point, then, is likely to be managerial resources. While money can be obtained for a new business without all the bother and delays of the paperwork, only a loan shark will extend such credit, and his money will carry with it interest rates and hidden costs that could well wreck an otherwise sound business venture. The exception to this is for those who have established credit ratings or personal relationships with reputable lenders.

Bank interest rate maximums are set by law. Many appli-

cants, then, are competing for loans none of which can be more profitable to the bank. Loans which require an effort to get people to pay or loans which are never paid cost the bank money to service. It is in the bank's interest, then, to find out certain things of applicants and to expect certain things of them.

Banks (and other lenders) look for four things in the applicant prior to extending a business loan:

1) Experience - While not absolutely essential, it is important that the applicant have worked in the same or a similar type of business he intends to establish. Managerial experience is very helpful.

2) Cash - Lenders expect applicants for business loans to put up money of their own. Banks normally require business loan applicants to invest one-half the capital needed for a new business. Minority entrepreneurs can get loans with no cash investment (equity); however, 15% of the total amount needed is usually required.

3) Credit record - Any man who is going into business for himself is expected to have paid his bills in the past unless there were good reasons for not having done so. A poor credit record --or even bankruptcy--due to circumstances beyond the applicant's control will not prevent most lenders

from advancing the loan. Past efforts to repay debts under adverse conditions are looked upon with favor.

4) Character - Lenders expect applicants to possess a basic honesty in their dealings with others. A criminal record does not hinder the loan if offenses were not too serious or were relatively long ago. If the applicant is straight forward about himself and past difficulties, most lenders will not hesitate to loan him money for a sound business venture.

CHECKLIST FOR GOING INTO BUSINESS

By Staff Members of the Small Business Administration, Washington, D.C.

SUMMARY

People sometimes go into business for themselves without being fully aware of what is involved. Sometimes they're lucky and succeed. More often, they fail because they do not consider one or more of the ingredients needed for business success.

This checklist is designed to help you decide whether you are qualified or have considered the various phases of going into business for yourself. Careful thought now may help you to prevent mistakes and to avoid losing your savings and time later. Use this list as a starter. Consider each question as it applies to your situation. Check off each question only after you've made an effort to answer it honestly. Before you omit a question, satisfy yourself that it does not apply to your particular situation.

After each section, you will find a few references. If you have uncovered doubtful areas or weaknesses in your preparation, it is strongly recommended that you obtain these publications and study them. You will find it time well spent. Most of the references are available, free, on request from any SBA field office or the Small Business Administration, Washington, D.C. 20416. However, the notation "Supt. Docs." means that the item is for sale at the price indicated by the Superintendent of Documents, Washington, D.C. 20402 (not from SBA).

QUESTIONS TO CONSIDER

Are You the Type?

	Yes	No
1. Have you rated your personal traits such as leadership, organizing ability, perseverance, and physical energy?	_____	_____
2. Have you had some friends rate you on them?	_____	_____
3. Have you considered getting an associate whose strong points will compensate for your weak traits?	_____	_____

REFERENCES: Starting and Managing a Small Business of Your Own (25¢ Supt. Docs.); SM 39, Balances Skills; Measure of Effective Managers, in *Marketers Aids Annual* 4 (35¢ Supt. Docs.); SM 46, Essential Personal Qualities for Small Store Managers in *Marketers Aids: Annual* 5 (45¢ Supt. Docs.); SM 114, Pleasing Your Boss The Customer.

What Are Your Chances for Success?

4. Have you had any actual business experience?	_____	_____
5. Do you have special technical skills, such as those needed by a plumber, electrician, mechanic, or radio repairman?	_____	_____
6. Have you obtained some basic management experience working for someone else?	_____	_____
7. Have you analyzed the recent trend of business conditions (good or bad)?	_____	_____
8. Have you analyzed business conditions in the city and neighborhood where you want to locate?	_____	_____
9. Have you analyzed conditions in the line of business you are planning?	_____	_____
10. Have you determined what size business you plan to establish (dollar sales per year)?	_____	_____
11. Have you built up a detailed set of figures on how much capital you will need to launch the business?	_____	_____
12. Have you figured how much time you will need until the business income equals the expenses?	_____	_____
13. Have you planned what net profit you believe you should make?	_____	_____

Copies of this Aid are available free from field offices and Washington headquarters of the Small Business Administration. Aids may be condensed or reproduced. They may not be altered to imply approval by SBA of any private organization, product, or service. If material is reused, credit to SBA will be appreciated. Use of official mailing indicia to avoid postage is prohibited by law. Use of funds for printing this publication approved by Bureau of the Budget, June 30, 1965.

	Yes	No
14. Will the net profit divided by the investment result in a rate of return which compares favorably with the rate you can obtain from other investment opportunities?	_____	_____

REFERENCES: Appraise Your Competitive Position to Improve Company Planning, in Management Aids Annual No. 2 (55¢ Supt. Docs.); Appraising the Market for the Services You Offer, in Marketers Aids Annual No. 2 (40¢ Supt. Docs.); Practical Business Use of Government Statistics (20¢ Supt. Docs.)

How Much Capital Will You Need?

15. Have you worked out what income from sales or services you can reasonably expect in the first 6 months? The first year? The second year?	_____	_____
16. Do you know what net profit you can expect on these volumes?	_____	_____
17. Have you made a conservative forecast of expenses including a regular salary for yourself?	_____	_____
18. Have you compared this income with what you could make working for someone else?	_____	_____
19. Are you willing to risk uncertain or irregular income for the next year? Two years?	_____	_____
20. Have you counted up how much actual money you have to invest in your business?	_____	_____
21. Do you have other assets which you could sell or on which you could borrow?	_____	_____
22. Have you some other source from which you could borrow money?	_____	_____
23. Have you talked to a banker?	_____	_____
24. Is he favorably impressed with your plan?	_____	_____
25. Do you have a financial reserve for unexpected needs?	_____	_____
26. Does your total capital, from all sources, cover your best estimates of the capital you will need?	_____	_____

REFERENCES: SM 102, Using Security to Get a Bank Loan; SM 107, Building Strong Relations With Your Bank; SM 110, Controlling Cash in Small Retail and Service Firms; A Handbook of Small Business Finance (35¢ Supt. Docs.)

Should You Share Ownership With Others?

27. Do you lack needed technical or management skills which can be most satisfactorily supplied by one or more partners?	_____	_____
28. Do you need the financial assistance of one or more partners?	_____	_____
29. Have you checked the features of each form or organization (individual proprietorship, partnership, corporation) to see which will best fit your situation?	_____	_____

REFERENCES: MA 80, Choosing the Legal Structure for Your Firm; MA 111, Steps in Incorporating a Business.

Where Should You Locate?

30. Do you know how much space you will need?	_____	_____
31. Do you know what type of building you will need?	_____	_____
32. Do you know of any special features you require in lighting, heating, ventilating, air conditioning, or parking facilities?	_____	_____
33. Have you listed the tools and equipment you need room for?	_____	_____
34. If the proposed location does not meet nearly all your requirements, is there a sound reason why you should not wait and continue seeking a more ideal location?	_____	_____
35. Have you checked the U.S. Census Bureau population figures?	_____	_____

REFERENCES: MRS 78, Site Evaluation for Small Retailers; Sizing Up Small Business Locations, in Marketers Aids Annual No. 1 (45¢ Supt. Docs.); SBB 16, Store Location.

Should You Buy a Going Business?

36. Have you considered the advantages and disadvantages of buying a going business?	_____	_____
37. Have you compared what it would take to equip and stock a new business with the price asked for the business you are considering?	_____	_____
38. Have you learned why the present owner wants to sell?	_____	_____
39. Have you checked the owner's claims about the business with reports from an independent accountant's analysis of the figures?	_____	_____

	Yes	No
40. Have you checked with the company's suppliers to obtain their ideas of the value of the business?	_____	_____
41. Do the suppliers think well of the proposition?	_____	_____
42. Is the stock of merchandise a questionable buy? (Would a large proportion of it have to be disposed of at a loss? Is any of it out of date, unsalable, or not usable?)	_____	_____
43. Are the physical facilities old or in poor condition and, hence, overvalued?	_____	_____
44. Are you sure the accounts receivable are worth the asking price?	_____	_____
45. Is the present company's good will fairly valued?	_____	_____
46. Are you prepared to assume the liabilities, and are the creditors agreeable?	_____	_____
47. Has your lawyer checked to see if the title is good and if there is any lien against the assets?	_____	_____
48. Are there any back taxes to pay?	_____	_____
49. Have the sales been temporarily increased by conditions which are not likely to continue?	_____	_____

REFERENCES: Key Factors in Starting a New Plant, in *Management Aids Annual* No. 5 (45¢ Supt Docs.); SM 20, Buying a Small Going Concern, in *Marketers Aids Annual* No. 2 (40¢ Supt. Docs.).

Are You Qualified to Supervise Buying and Selling?

50. Have you estimated your total stock requirements?	_____	_____
51. Do you know in what quantities users buy your product or service?	_____	_____
52. Do you know how often users buy your product or service?	_____	_____
53. Have you made a sales analysis to determine major lines to be carried?	_____	_____
54. Have you decided what characteristics you will require in your goods?	_____	_____
55. Have you set up a model stock assortment to follow in your buying?	_____	_____
56. Have you investigated whether it will be cheaper to buy large quantities infrequently or in small quantities frequently?	_____	_____
57. Have you weighed price differentials for large orders against capital and space tied up?	_____	_____
58. Have you decided what merchandise to buy direct from manufacturers?	_____	_____
59. Will you make your account more valuable to your suppliers by concentrating your buying with a few of them?	_____	_____
60. Have you worked out control plans to insure stocking the right quantities?	_____	_____

REFERENCES: SM 97, Steps in Making a Business Decision; SM 100, Make Selling Attractive to Salespeople; SM 113, Quality and Taste as Sales Appeals; SM 116, How to Select a Resident Buying Office; SM 120, Building Good Customer Relations SBB 37, Buying for Retail Stores.

How Will You Price Your Products and Services?

61. Have you determined what prices you will have to charge to cover your costs and obtain profit?	_____	_____
62. Do these prices compare favorably with prices of competitors?	_____	_____

REFERENCES: How to Price a New Product, in *Management Aids Annual* No. 3 (45¢ Supt. Docs.); SM 105, A Pricing Checklist for Managers; SM 21, Pricing and Profits in Small Stores, in *Marketers Aids Annual* No. 2 (40¢ Supt. Docs.).

What Selling Methods Will You Use?

63. Have you studied the sales promotional methods used by competitors?	_____	_____
64. Have you outlined your own sales promotion policy?	_____	_____
65. Have you studied why customers buy your product (service, price, quality, distinctive styling, other)?	_____	_____
66. Will you do outside selling?	_____	_____
67. Will you advertise in the newspapers?	_____	_____
68. Will you do direct mail advertising?	_____	_____
69. Will you use posters and handbills?	_____	_____
70. Will you use radio and television advertising?	_____	_____

REFERENCES: SM 16, Improving Personal Selling in Small Business in *Marketers Aids Annual* No. 2 (40¢ Supt. Docs.); SM 109, Stimulating Impulse Buying for Increased Sales; SBB 20, Advertising-Retail Store.

How Will You Manage Personnel?

71. Will you be able to hire satisfactory employees, locally, to supply skills you lack?	_____	_____

	Yes	No
72. Do you know what skills are necessary?	_____	_____
73. Have you checked the prevailing wage scales?	_____	_____
74. Have you a clear-cut idea of what you plan to pay?	_____	_____
75. Have you considered hiring someone now employed by a competitor?	_____	_____
76. Have you checked on the pros and cons of doing so?	_____	_____
77. Have you planned your training procedures?	_____	_____

REFERENCES: SM 103, Revitalize Personal Selling in Your Store; Sales Training for Small Wholesalers, in *Marketers Aids Annual No. 1* (45¢ Supt Docs.); SBB 23, Training Retail Sales People; Sales Training for the Smaller Manufacturer (25¢ Supt. Docs.)

What Records Will You Keep?

78. Have you a suitable bookkeeping system ready to operate?	_____	_____
79. Have you planned a merchandise control system?	_____	_____
80. Have you obtained standard operating ratios for your type of business to use as guides?	_____	_____
81. Have you provided for additional records as necessary?	_____	_____
82. Have you a system to use in keeping a check on costs?	_____	_____
83. Do you need any special forms?	_____	_____
84. Have you made adequate provision for having your record keeping done?	_____	_____

REFERENCES: MA 75, Protecting Your Records Against Disaster in *Management Aids Annual No. 5* (45¢ Supt. Docs.); SM 94, Keeping Score With Effective Records; SBB 15, Record Keeping Systems--Small Store and Service Trade.

What Laws Will Affect You?

85. Have you investigated what, if any, licenses to do business are necessary?	_____	_____
86. Have you checked the health regulations?	_____	_____
87. Are your operations subject to interstate commerce regulations?	_____	_____
88. Have you seen your lawyer for advice on how to meet your legal responsibilities?	_____	_____

REFERENCES: SM 118, Legal Service for Small Retail and Service Firms; SM 42, FTC and Guides Against Deceptive Pricing in *Marketers Aids Annual* 4 (35¢ Supt. Doc.) SM 24, Small Business and the Federal Trade Commission, in *Marketers Aids Annual 2* (40¢ Supt. Docs.)

What Other Problems Will You Face?

89. Have you worked out a system for handling your tax requirements?	_____	_____
90. Have you arranged for adequate insurance coverage?	_____	_____
91. Have you worked out a way of building a management team?	_____	_____
92. Does your family (if any) agree that your proposed venture is sound?	_____	_____
93. Do you have enough capital to carry accounts receivable?	_____	_____
94. Will you sell for credit?	_____	_____
95. Have you worked out a definite returned goods policy?	_____	_____
96. Have you considered other management policies which must be established?	_____	_____
97. Have you planned how you will organize and assign the work?	_____	_____
98. Have you make a work plan for yourself?	_____	_____

March 3, 1971

Dr. Emory Via
Southern Regional Council
5 Forsythe Street
Atlanta, Georgia

Dear Dr. Via:

M.A.M.A., a newly incorporated profit-making minority business management and consultant firm, has been brought into service to this community out of the recognition that such services are needed most desperately if the minority persons seeking to uplift their status through economic development might have an opportunity to be guided and assisted past pitfalls that result in the large number of minority business failures.

It is our belief, that our services will not only prevent failure but will be critical in assisting the ambitious in getting a start. It has been our observation that frontend or seed money presents a real problem in getting proper counsel and facts before entering a particular business. It is our hope that M.A.M.A., can have at its' disposal a reserve restricted fund for such assistance. This fund would be regenerated through its use as investment capital into the business that are assisted through its use.

Mr. A. Black of the N.A.A.C.P Legal Defense Fund, suggested that we write you for possible assistance or referral in providing us with a list of persons business of foundations that might be sympathetic to our needs.

Yours for consideration,

Dedrick Brittenum

Mr. Emory Via
Southern Regional Council
Five Forsyth Street
Atlanta, Georgia

Dear Mr. Via:

I am happy that I had the opportunity to stop by and discuss the Hilton Head question with you last Friday. When your preliminary investigation of the situation is completed, one of our staff people could visit your office to discuss the results with you, as I suggested during our conversation. I'm doubtful, based on our talk, whether there will be any further work on the Hilton Head problem with which we can help, but we would probably have some useful suggestions on how to proceed.

At your suggestion, I will be in touch with Lee DeCola, the MKGK staff member involved in Model Cities evaluation in Atlanta, and will suggest that he call Art Campbell of the SRC Resources Development Center to arrange an appointment.

We will try to keep you informed of any of the firm's activities in the region which might be of interest to the Council. In the meantime, do you have any SRC publications which would keep me abrest of the range of your activities? I would appreciate being on any appropriate mailing list.

I enjoyed meeting you. Please let me know if we can be of any help, and particularly if a visit regarding the preliminary Hilton Head investigation seems appropriate.

Sincerely yours,

William Morgan

July 4, 1970

Dear Well-wisher:

We are extremely happy to bring to your attention our introductory issues of BLACK BUSINESS DIGEST.

More than 200,000 readers will obtain timely facts about government and private activity that extends a helping hand to the economic development of America's minorities. In addition, legislation, financing and technical assistance - which are available for aspiring entrepreneurs - will be documented in-depth.

The BLACK BUSINESS DIGEST factual reporting will keep our readers tuned in on creative and innovative approaches to find feasible solutions for a critical problem. From our non-partisan perch the DIGEST will analyze and discuss the WHYS, HOWS, and WHATS of Black Business Development.

Our thrust is to stimulate, motivate and challenge our readers to create and support viable businesses in the inner-city.

Why not join us? You can by publicizing your participation through the pages of BLACK BUSINESS DIGEST. Incidentally, you can continue to read about Black Capitalism by completing the enclosed coupon and mailing it with $10.00 for your annual subscription.

Sincerely

Albert D. Hendricks

BLACK BUSINESS DIGEST "INDEPENDENCE DAY" AWARD

Maybe your idea won't win the $100,000 — — — But we will tell you who won and why!

*Who else will tell you the facts about Black Capitalism?

*Who else will tell you all about federal, state and local programs and legislation to help small businesses?

*Who else will tell you where and how you can get non-government money to fund black businesses?

*Who else will "tell it like it is" about franchising traps?

*Who else will tell you about the difference between SBICs (Small Business Investment Companies) and MESBICs (Minority Entrepreneur Small Business Investment Companies)?

*Who else will tell you how to solve your BIG business problems?

*Where else can you get "how-to-do" tips, which use Modern Management techniques for small business?

*Where else can you get case histories of black business with an analyses of their successes and failures?

*Who else will go "where the action is" to find out and bring you the help you need to succeed in Black Capitalism?

BLACK BUSINESS DIGEST WILL DO ALL THIS AND MORE!

NAM Urban Affairs Division

action report

National Association of Manufacturers//Urban Affairs Division

Subject
Employment

Location
Alton,
Illinois

The Laclede Steel Company, in cooperation with the Alton Branch of the NAACP has initiated a program to hire and train hard-core unemployed persons. Laclede has contracted with the Training Corporation of America (TCA) of Falls Church, Virginia to counsel and provide basic education to the group to be hired. Recruiting stations were established in areas of high unemployment and members of the NAACP worked with Laclede officials in taking applications.

The recruits spend approximately one week with TCA people who will orient them to the program. After a week they are employed on a half day basis and they will attend classes the other half day. This lasts for about 55 days before the trainees become full time employees. Following employment TCA staff will be used for follow up and discussions of any problems that might arise on the job such as absenteeism. The TCA counselors will provide the recruits with education, group sessions and discussions about individual problems.

Actual training for the jobs will be handled by Laclede supervisory personnel. The trainees will be hired into plant jobs, some semi-skilled and unskilled. These entry level jobs are provided in the labor agreement with the Steelworkers Unions. Once the trainees are on the job full time they will have the opportunity to compete for better paying jobs. The jobs will pay a minimum of $2.41 an hour.

TCA spokesman described their aims for the trainees as "the same as theirs; we want them to work and we will do all in our power to prepare them place them, and assist them, with the cooperation of the employer, to adjust to the job."

Laclede defined the hard core at whom this program is directed as people who have educational deficiencies, unrealistic approaches to the world of work and in some cases police records. Laclede feels that through TCA a professional job will be accomplished in an area in which extremely few individuals or companies have had any real experience.

Following the initial seven weeks of the program Laclede and TCA officials said that the program had "gone beyond our expectations." Of the 31 unemployed men enrolled in the training program, 26 remained with five dropped for various reasons. Every man in the program had some negative experiences seeking employment prior to enrolling in the program. Two men could not read or write but their initiative enabled them to function well. Many of the trainees were found to have alcoholic problems and 19 had been arrested. The TCA research indicated that the trainees

lacked confidence, lacked realistic attitudes toward work and had inadequate educations.

After participating in the program the trainees' attitudes were seen to be very positive.

Laclede has been encouraging other companies in the area to examine this approach to training the hard core and through their experience design programs in this critical area.

The Urban Affairs Division of the National Association of Manufacturers is committed to assist the private sector as it participates in programs aimed at solving the problems of urban life.

Specific aids available include:

Urban Affairs Action Reports:
Continuing information about programs concerned with EMPLOYMENT, EDUCATION, HOUSING, TRANSPORTATION, ENVIRONMENTAL CONDITIONS, as examples of action being taken by companies and communities in the various problem areas.

In-Depth Research Reports:
In-depth examinations of special problem areas that will concern urban affairs programs.

Urban Affairs Program Directors:
A staff of experts is available with a full range of program information to personally assist companies and communities in the design and implementation of programs in all phases of urban affairs.

Wallen Charges Two Antipoverty Agencies Won't Compromise on Duplicating Programs

By RICHARD SEVERO

Saul Wallen, the president of the New York Urban Coalition, yesterday accused two antipoverty agencies of refusing to eliminate programs that duplicate and overlap one another.

Mr. Wallen said that neither the Manpower and Career Development Agency nor the State Employment Service "have shown a willingness to engage in meaningful negotiation and compromise on the subject of reconciling their programs to avoid duplication."

His remarks were made before a subcommittee of a special City Council committee investigating the effectiveness of welfare and antipoverty programs in New York City.

The Manpower and Career Development Agency is a subdivision of the Human Resources Administration, the superagency that runs the city's welfare and antipoverty programs. The development agency has received $30-million in the capital budget to set up centers for vocational counseling, skill training and the placement of unemployed poor people.

Sides Held Intractible

Mr. Wallen said that the Urban Coalition "general favors the idea," but added it thinks the program should be implemented "only if the city and the State Employment Service, which is creating a competing and overlapping manpower system of the same type, consent to coordinate their programs and to eliminate overlapping by consultation with a manpower policy planning committee, to consist of government and private agencies. . .

"Both M.C.D.A. and the State Employment Service have been intractible," Mr. Wallen told the councilmen.

The State Employment Service had no immediate comment. A spokesman for Cyril Tyson, the commissioner of M.C.D.A., issued a statement denying that either the development agency or the State Employment Service were "intractible."

"It is true that there have been differences of opinion about the extent of the State Employment Service's participation in the regional manpower system," the spokesman said, "but these are actively being resolved by M.C.D.A. and S.E.S."

Seventeen persons either spoke or presented statements to the subcommittee, which conducted a day-long, sometimes highly emotional hearing.

As the proceedings were about to start, Councilman Theodore S. Weiss, Democrat of Manhattan, the subcommittee chairman, complained that although Federal officials were invited, none chose to attend.

Robert H. Finch, Secretary of the Department of Health, Education and Welfare, reported that he would not be present because he had to make an appearance before a committee of the United States Senate, Mr. Weiss said.

According to Mr. Weiss, Daniel Patrick Moynihan, a special assistant to President Nixon who specialized in urban problems, did not respond to his invitation.

"Welfare is a national problem," Mr. Weiss said. "What we are doing here is being watched by other major cities with similar problems. The conclusions we arrive at and any changes we make in the welfare structure will have far-reaching effects. For these reasons, I cannot understand why no Federal spokesman is present."

Mr. Weiss added that either Mr. Finch or Mr. Moynihan could have sent substitutes.

At one point, Mr. Weiss had to warn those who testified against using profanity, since their testimony was being broadcast by the city radio station, WNYC.

Nicholas Kisburg, the legislative director of Teamsters Joint Council 16, criticized the Human Resources Administration by saying: "Trying to help the poor through H.R.A. is like trying to help sparrows by feeding horses."

Mr. Kisburg referred to Human Resources Administrator Mitchell I. Ginsberg as "a great punjab" who was permissive on the question of illegitimacy and fathers who illegally abandon children.

He called for the replacement of both Mr. Ginsberg and Jack R. Goldberg, the welfare commissioner, by "administrators who will not think that work is a Protestant fetish or a Calvinist shibboleth, welfare administrators who will not think that the transient, consensual union and its illegitimate births is just as desirable as stable, legal marriages and legitimate births. . . ."

A Black Consulting Firm Finds Management Jobs for Negroes

Bates College Group Concluded Service Would Be Useful

By DAMON STETSON

Five Negro graduates of Bates College, in Lewiston, Me., have established a management consulting firm that is placing minority group members in executive positions with some of the nation's top corporations.

The founders of the firm with offices here and in San Francisco had concluded on the basis of their own experiences after graduation that there was a dearth of services in the business community for recruiting qualified black executives and for assisting companies in the creation of policies and working environments favorable to the employment of minorities.

David O. Boone, the 31-year-old president of the firm, Boone, Young and Associates, had worked in sales and marketing for Sears, Roebuck & Co. and the International Business Machines Corporation.

●

"I kept running into company officials in my sales work who would ask if I knew of some minority-group guy that they could hire," he explained. "And I also ran into a lot of [black] individuals who weren't happy in their situations or were underemployed and looking for a chance to move up."

Mr. Boone, who lives in Dumont, N.J., and has been active in the Fair Housing Council in Bergen County, also realized that the black executive needed "sophisticated consultative guidance to help him reach the decision-making level as rapidly as possible."

A year ago Mr. Boone discussed his idea with three of his college friends: William A. Young III, who was serving as a capital projects administrator at the General Foods Corporation; Dennis Tourse, then a student at Harvard Law School, and Frederick A. Drayton, who was with the United States Department of Labor in Washington.

●

"It was a lot of fun," Mr. Boone said later of the nights that the group spent planning the firm. "And we got a generally receptive and friendly reaction." Equally important, they raised $100,000 from banks and private sources, and opened offices at 551 Fifth Avenue last August.

Mr. Boone is president and chairman and Mr. Young executive vice president and secretary - treasurer. Mr. Tourse and Mr. Drayton are vice presidents. John Douglas, another Bates alumnus, who is currently doing graduate work at Santa Clara University, is also a vice president and is running the firm's newly opened branch office in San Francisco.

"We're trying to provide more than executive search services," Mr. Boone said in an interview. "We don't want to be just an employment service."

●

As a consequence, he explained, the firm, its account executives and consutants are meticulous in seeking to find just the type of person with the precise qualifications that a client firm is seeking.

"Rather than send 15 propects," Mr. Boone said, "we want to be able to send the one man who will be the one the client will hire."

Clients must also be chosen carefully. "We have to weed out the companies we can't work with," he said. "If all they want to do is give lip service to hiring blacks, we're not prepared to work with them."

●

At present, however, the firm is dealing with more than 40 client companies, including several of the nation's largest. Most of the firm's placements to date have been at the $10,000 to $25,000 salary level, but the company is currently looking for a man with top flight executive qualifications for a $60,000 a year position.

The firm recently located an executive vice president at $20,000 a year for a new food franchise company that wanted a man strong in financial management. The man the firm found was working on the corporate control staff of a large corporation, but he wanted to become associated with a smaller concern.

●

In a reverse situation, a large New York corporation wanted an engineer. The consulting firm located a young engineer in Wichita, Kan., who had just the qualifications. The corporation brought him to New York for an interview, hired him and paid his relocation expenses.

One of the key objectives of Boone, Young and Associates is to assist corporations in providing positive environments in which minority group members can work and advance.

"It would be foolhardy, indeed," Mr. Boone said, "for a firm to search for, locate, hire, and train a qualified individual only to lose him in a few months because the environment in which that person is asked to work leaves much to be desired."

Aerospace Industry Criticized on Job Policies for Minorities

BY JACK JONES
Times Staff Writer

Aerospace industry efforts to step up hiring and advancement for minority group employes were sharply criticized here Wednesday by U.S. Equal Employment Opportunity Commission members who said results have not matched the publicity.

"What I heard today," said Chairman Clifford L. Alexander Jr. after several hours of testimony at the Federal Office Building, "were a great many statements of good intentions."

"There were a great many glossy brochures, a great many percentages based on low figures and almost no advancement in the hiring, promotion and full utilization of workers available here—minority and female," he added.

Hearings today will focus on the movie production industry and Friday on the three major television networks along with three of the area's largest white-collar employers—Occidental Life, Bank of America and Security Pacific National Bank.

Alexander obviously was irked Wednesday by explanations that qualified minority talent is hard to find and by "meager results" he felt were made to appear substantial.

He suggested many companies are not really seeking out capable minority people and are not going far enough to insure equal advancement opportunities for those hired.

Title VII of the Civil Rights Act of 1964, which set up the commission and which requires equal employment by companies doing business with the government, is "the law of the land," he stressed.

"It is about time these corporations—many of whom are screaming for law and order—obey the law themselves."

Appearing to present accounts of company programs in the minority hiring field were executives of McDonnell Douglas Corp., Lockheed Aircraft Corp., North American Rockwell Corp. and TRW Systems.

Hughes Aircraft, unable to be heard in the tight schedule, submitted a written statement for the record.

Union Man Heard

Nor was industry alone in getting sharp questioning from the commissioners. An international representative for the International Assn. of Machinists (IAM), which bargains for many aerospace workers, also was taken over the statistical hurdles on apprenticeship programs and the ethnic makeup of union leadership.

Merl R. Felker, McDonnell Douglas director of personnel operations in Santa Monica, emphasized that his company has trained thousands of persons under federal manpower programs and is committed to hire and train 500 "hard-core" jobless under the nationwide JOBS program.

The company, he said, "has a commitment and a belief in merit employment."

But—as with other executives—commissioners asked pointed questions about the percentage of minority people in manager and official categories.

For McDonnell Douglas, Felker said, 4.4% of the managers and officials are minority persons.

Commissioner Vicente T. Ximenes, who paid particular attention to the Mexican-American employment figures during the hearing, asked Felker if he thought it was fair to say the company's minority work force has increased by 961% since 1961 "when you started with practically nothing?"

Gives Explanation

Felder said that was the year his company (then Douglas) signed its Plans for Progress agreement and really began "going out into the community to implement it."

Like other aerospace executives, he pointed out that work cutbacks and loss of contracts have caused decreases in overall employment, "but our percentage of white-collar minorities still increased."

Lockheed's Dudley Browne, group vice president of finance and administration, recited companywide figures to show 5,400 Negroes, 2,922 Spanish-surnamed Americans, 1,295 Orientals and 109 American Indians were employed.

Distance Hampers

But in the Los Angeles area, he said, minority hiring has been hampered because plants in the San Fernando and Antelope Valleys are long distances from minority areas.

He also pointed to cutbacks in which "our minority employes were disproportionately affected because of their relatively low standings in seniority . . ."

He noted that Lockheed is about to install a 300-employe plant in the Watts-Willowbrook area.

He was quizzed closely about the ethnic makeup of the executive force, basically Anglo, and about the number of Negroes, Mexican-Americans and other minority workers promoted to supervisory positions during the past year.

Harry Winston, Lockheed-California Co. director of industrial relations, said 1,689 professionals (mostly engineers) were added last year—of whom 124 were minority persons.

Ximenes observed that all the policies aimed at upgrading minority workers into white-collar jobs "have been a failure."

The commission has pointed out that Negroes and Mexican-Americans make up 20% of the population here, but that both groups are generally concentrated at lower occupational levels with Negroes holding only 3.4% of the white collar jobs and Mexican-Americans only 4.4%.

"Maybe," Ximenes told Winston, "what you need is a training program for hard-core management rather than hard-core unemployed." He said, "Management has a fine statement of policy, but a series of gate keepers close the doors to minority people."

Two other executives questioned by the commission were Elmer P. Wohl, staff vice president for administration of North American Rockwell Corp., and Dr. R. D. DeLauer, vice president and general manager of TRW Systems.

Wohl said his company has made equal opportunity "an integral part of line management responsibility" and that white-collar minority employment is increasing at his company "against a decline in our total number of available white-collar jobs."

But commissioners were not happy

But commissioners were not happy with Wohl's statement that of 6,690 in the official and-manager category, there are only 58 blacks and 66 Mexican-Americans.

Increase Small

Alexander noted that the increase in two years was so small that it will take 15 years to reach a proportion of even 3%.

DeLauer also presented figures to show that TRW is trying to maintain an active minority hiring and advancement program but triggered quick commission reaction when he said:

"The problem is there is an insufficient number of adequately educated and trained minority personnel to satisfy the (highly technical) needs of our industry."

Alexander challenged him to look to universities and the community and asked, "Did you know that a black college graduate makes less than a white dropout?"

'Go Find Them'

Told by DeLauer that TRW is looking for people, Alexander retorted, "You can go out and find them. There are people in your industry who have done significantly better than you."

Herbert C. Ward, IAM international representative, said he thinks his union has a "good, fair" apprenticeship program, but was quizzed about the entrance test—which commissioners said tends to shut out Negroes and Mexican-Americans.

He conceded he is the union's only black international representative and that there is only one Mexican-American. But he explained that they are chosen from business representatives who are elected.

Claim Discrimination

Two Negroes — George W. Sherard, an engineer-physicist, and Lloyd Napier, a Texas-educated lawyer working as a contract analyst — testified that discrimination in aerospace companies had held them back from promotions they felt they deserved.

Sherard said Caucasians with less experience had been promoted over him and Napier told the commission he has spent seven years at the same grade level.

Through most of the hearing, several persons led by Abe Tapia, president of the Mexican-American Political Assn., displayed signs reading "EEOC Is Not for the Chicanos" and "Vicente Ximenes Sold Us Out."

Demand for Negro college graduates exceeds supply

By ARNOLD SAWISLAK

WASHINGTON, D.C. (UPI) — Top dollar jobs for Negro college graduates are going begging in some parts of the country, a survey of placement officials showed today.

From New York to California, a spot check of the job offer situation by United Press International bureaus showed:

The demand for black graduates, especially in such fields as engineering and chemistry, exceeds the supply.

Starting salaries, for blacks as well as whites, exceed $8,000 in a number of fields, with some indication that qualified Negroes can get premium pay.

If businesses are seeking "showcase" Negroes, the placement officers haven't been able to detect it.

Placement officers at 15 institutions, ranging from big state universities to relatively small colleges, were asked whether employers were actively recruiting black graduates, whether the demand was larger than the supply, whether there was any sign of "token hiring or quota systems," and how starting pay for blacks compared with offers to white graduates.

With the possible exception of teaching, the placement officers said there was a shortage of black graduates to fill available jobs. But most said demand was high in every field, including education.

Some get up to 8 offers

"Some of our students have had as many as eight offers this year," Alicia Ammons of the Tuskegee Institute placement office said. "The largest demand has been for engineering students."

"At our institution, the supply is not adequate and we cannot meet the demand in any field," Eugene Nelson, acting director of the University of Colorado placement office, said. "Sales, office work, you name it, we could place graduates."

Tuskegee had contacts from 400 recruiters for its 500 graduates. Morgan State College, a predominantly black school in Baltimore, had 200 recruiting visits. At San Francisco State College some corporations sent special recruiting teams seeking only Negroes.

No placement official detected tokenism in the surge of demand for black graduates, but some conceded it could be a factor. Howard Lumsden, University of Tennessee placement director, said "there may be some token hiring, of course, but for the most part employers are sincere."

P. John Lymberopoulos of the University of Colorado School of Business said he did think some of the recruiting for Negroes was "window dressing." He also thought it was stimulated by federal money in industry and the attention to minority employment that accompany government contracts.

Judy Nettesheim, in charge of secondary school placement at the University of Chicago, and Arthur Eckberg, placement director at the city's Roosevelt College, saw no evidence of tokenism in their many requests for black graduates.

Miss Nettesheim said some schools seeking teachers "have stated a preference for blacks, but will take a good prospect, black or white."

Some Negroes suspicious

John Munschauer, director of the Career Center at Cornell University, said black students were suspicious of token or "showcase" hiring of Negroes "and I certainly think that to some extent this is justified." Munschauer said he would steer graduates away from such job offers because "there are a lot of very sound opportunities out there."

Dr. William M. Nix, director of placement at predominantly Negro Morehouse College in Atlanta, discounted tokenism: "I think those who come to us are sincere. We have tried to turn out a quality graduate, and as we have followed them over a five-year period, there has been a favorable feedback."

On the salary question, all the officials contacted said black graduates were getting equal, and in some cases higher, pay offers. The salaries mentioned ranged from $6,000 to $8,000 for journalism graduates at Ohio State University to $10,000 for engineering graduates at UCLA.

In every case the starting salaries being offered Negro graduates exceeded the U.S. Census Bureau's 1966 figure of $5,928 for the median income of nonwhite men who had attended college. The comparable figure for white workers with college was $9,023.

Nix said the average for Morehouse graduates was roughly $8,000. At Tuskegee it was $750-$900 a month for engineers, about $200 less for business and education graduates. Mrs. Barbara Mann at Fisk University in Nashville, Tenn., said starting pay in business jobs was about $650 a month.

At the University of Minnesota, the figures were about $700 a month for business, about $6,800 a year for teaching, about $140 a week for journalism, but higher in advertising jobs. New teachers out of the University of Tennessee were offered about $6,000 a year.

Some black grads get more

The majority of placement officers said the salary offers were the same for blacks as they were for whites, but a few said black graduates can get more because of the law of supply and demand.

"The black graduate in such fields as engineering and general business is in scarce supply and as such enjoys a premium of 10 to 20 percent in starting salary more than the white graduate," Ed Shaw, head of the UCLA placement office, said.

Dr. Vernon Wallace, head of the San Francisco State placement office, said listed starting salaries are the same for all, but "when a black is hired he may end up with a higher salary than his white competitor."

Colorado's Nelson said there was no apparent difference in starting salaries, a recruiter might place a Negro with a C average on the same level as the white students with an A average in deciding which to hire.

A question that was not asked was answered anyway by several officials: Are college graduates interested in getting out of school straight into jobs?

At Morehouse, 60 percent of the bachelor degree graduates are going on to graduate school. About half of these were actively recruited by colleges in competition with the agents of industry offering jobs.

At Cornell "many" of the graduates are going on to seek higher degrees. Manuschauer said "graduate school is simply what students do now. With the draft a factor, many run toward teaching and such areas."

SUNDAY HERALD TRAVELER, JUNE 8, 1969

Graduates Get Well Paid Jobs

Most of 1969's crop of job-seeking seniors scheduled for June graduation from New England colleges and universities will move immediately after commencement into challenging and well paid employment. The interest of corporations from all over the country in these young people remained high this spring although perhaps a shade less than in the record years 1966, 1967 and 1968.

Especially favorable prospects confront graduates with specialized training, particularly in engineering and accounting where the demand of the past few years continued unabated. Majors in the humanities and social sciences frequently found employment less easy to locate and beginning salaries somewhat lower than those offered their more specialized classmates.

Girls this spring were offered many jobs in such traditionally feminine strongholds as librarianship, teaching, nursing, secretarial science and retailing. In a few occupations less dominated by women, the girls encountered increasing competition as a fairly sizable number of young men decided to seek employment rather than to enter graduate study.

COMPARED WITH SPRING 1968, beginning salaries were higher for most jobs by about 5 to 7 per cent, with offers to accountants and engineering usually leading the way.

Holders of newly earned graduate degrees found employment prospects good this spring as a wide range of industrial, educational and governmental employer groups sought their services. Salary offers to a sizable portion of these young scholars tended to cluster within the $12,000 to $14,000 bracket.

These and other findings of a study conducted by the Boston Office of the U.S. Department of Labor's Bureau of Labor Statistics were made in a report released today by Edward T. O'Donnell, assistant director of the Bureau's New England Office.

THE REPORT comments also upon the continuing although perhaps slightly lessened confusion among students concerning their draft status.

Also mentioned is the belief voiced by a small but indicative sample of corporate recruits that the wave of disturbances on college campuses has not been aimed at the recruiting programs of most companies and that visits to campuses still provide a most effective means for corporate interviews and students to come together for discussion of employment problems under conditions favorable to all concerned.

However, the report suggests, continued success of campus recruitment necessarily will depend upon cooperation and good relationships between students, placement directors, and corporate interviewers.

WALL STREET JOURNAL

Program to Upgrade Skills And Wages Receives Funds

By a WALL STREET JOURNAL *Staff Reporter*

WASHINGTON — A test program designed by New York City to encourage industry to upgrade the wages and skills of low-income workers will be funded by the Nixon Administration.

Under the program, the Labor Department will provide $900,000 to compensate some 24 companies that upgrade their employes. Participating companies will receive incentive payments at the end of each six-month period during which they raise the weekly pay of a low-income worker by at least $5 and his total pay over the six months by at least $125.

Over the three-year life of the program the maximum payment to an employer would be equal to about 33% of the raises he gives to employes enrolled in the program. Some 500 employes will be included in the pilot project.

Labor Secretary Shultz has recently stressed his concern that unless low-income employes are promoted into higher skilled jobs there won't be enough entry-level positions in which to place the hardcore unemployed.

LABOR LETTER (continued)

cessor, Roy Siemiller. He'll concentrate on improving communication with rank-and-filers, especially those under 30. "We're going to have to develop new and better ways to reach" members, says Smith, who is 56. In the 1970s, he believes, union bargainers will "increasingly aim" for early retirement plans and other protection for workers displaced by automation.

Smith, who joined the union when he went to work in a St. Louis machine shop, is the first machinists president to come out of the railroad industry.

* * *

ORGANIZING OFFICES of the AFL-CIO Industrial Union Department are closed in Boston, Philadelphia and Chicago. The IUD, badly hurt by last year's pullout of the Auto Workers, asks affiliates to lend it organizers to bolster efforts in the South. Some staffers talk of a possible dues increase next fall to improve finances.

* * *

TEACHER MERGER? Massachusetts units of the rival National Education Association and the American Federation of Teachers set up a commission to study "the feasibility of establishing a relationship." The merger talks could spur similar negotiations in other states.

* * *

LABOR LAW REFORM will be promoted by the U.S. Chamber of Commerce in a nationwide series of workshops. The chamber hopes to build support for reducing the power of the NLRB, which it believes has a pro-labor bias. Prospects hinge heavily on whether the 1970 elections turn Congress more conservative.

* * *

LITTLE FIRMS, those with under 500 employes, play a big role in the JOBS program, which offers employers Federal subsidies to hire and train the hardcore unemployed. The Labor Department reports that 31,000 of 71,000 jobs provided so far are with small companies.

* * *

PILOTS UNION grows rapidly as the airline industry expands.

The Air Line Pilots Association has more than doubled its membership to 36,800 in the past five years, adding 14,000 pilots and 6,000 stewardesses. Beefing up its headquarters staff, the 38-year-old AFL-CIO affiliate lures a top NLRB attorney to head its legal department and a National Mediation Board official to direct its negotiators.

The union also moves its base from Chicago to Washington, where it can keep closer tabs on Congress, the Civil Aeronautics Board and the Federal Aviation Administration. "No industry, bar none, has more government regulations," asserts an ALPA staffer. The union will lobby hard for increased Federal spending on airport modernization and air-safety devices.

ALPA members who carry captain ratings earn an average of $28,000 a year; some get as much as $42,000.

* * *

THE CHECKOFF: Turning back a strong challenge, 57-year-old Lee Minton wins reelection as president of the Glass Bottle Blowers Association at the union's convention in Florida. . . . Personel-short Perkins Engines Ltd. in Peterborough, England, hopes to recruit skilled workmen by inviting them to drop by the Bull Hotel for a beer and a job talk; next week, Perkins will try to lure office gals by inviting them to the plant for tea. . . . The Federal Aviation Administration proposes a rule that would require more frequent electrocardiograms for commercial pilots, "to detect possible significant heart disease at an earlier stage."

NEW YORK TIMES JUN 15 1969

Recruitment of Negro Graduates by Business Sets Record in Small Colleges in the South

When a chunky black student named Hamilton Holmes enrolled in 1961 at the University of Georgia to make the first successful attack on the state's segregated school system, his kid brother, Mike, was 15 years old.

Those were tense days of riot on campus and predictions by segregationist politicians that a black Armageddon was fast approaching. Yet the things that Mike Holmes remembers best are the angry, whispered middle-of-the-night phone calls to his family's Atlanta home.

"We were getting so many threats the phone company gave us a private listing," he recalled. "But the callers got the new number even before my father did, so we figured they had tapped our line."

No one taps the family's telephone today, unless it's a white recruiter from a major corporation trying to hire Mike Holmes. For now he is a much sought after accounting graduate of Morehouse College, a small, predominantly Negro school in Atlanta.

A 'Super Negro'

Mike Holmes, in the lexicon of the recruiters, is a "super Negro," a talented young black man deemed a good prospect to make the geographic and social jump from Georgia to New York or Los Angeles. Although only an average academic student, the aggressiveness he showed in nearly 50 job interviews brought him 22 job offers by the time the bloom of the brilliant azaleas began to fade on Peachtree Street.

Young Mr. Holmes is but one of many young Negro graduates who this month are being wooed as never before by white job recruiters. The search for Negro graduates has been increasing for years, but only lately have the recruiters begun to flock to the graduates of the hitherto ignored small Negro schools of the South.

The convergence of two unrelated factors has helped make 1969 a watershed year for black graduates of small Southern institutions: a general manpower shortage in business and industry created by rapid technological advancement, and continued, if spotty, pressure from Washington for equal opportunities for minority groups.

Dramatic Advance

Altogether, the situation represents a dramatic change from past patterns, in which graduates of all-black or predominantly black schools in Southern or border states were ignored by recruiters from major business concerns and automatically relegated to "traditional" careers for the Negro professional, in education, civil service or the social services.

But even as the present situation shows marked improvement, there appears to be a growing concern on some black campuses that the long-term trend is not as healthy as it seems.

In a spot check by The New York Times of Negro campus placement officers and black talent recruiters for major industries, these themes showed up:

¶Negroes involved in placing black college graduates in jobs expressed fears that many major companies were not committed to the spirit of Title VII of the 1964 Civil Rights Act, which provides for fair employment practices.

¶Job placement directors reported that they were aware of many large concerns that regularly send recruiters to their campuses but have never hired a Negro.

¶Some black college officials said they detected signs of tokenism cropping up in the hiring policies of some major companies that had helped pioneer the opening up of the white-collar world to the Negro college graduates.

¶Grave reservations were expressed by many of these same officials about the Nixon Administration's willingness to crack down on companies that circumvent Federal fair hiring provisions, or ignore them entirely.

¶A sidelight to the initial excursions of national recruiters onto small black campuses in the South is the failure of Southern-based businesses to match the effort. There is little evidence, the placement officers agreed, that large concerns doing business entirely in the South are willing or able to compete with outsiders for black talent, thereby swelling the exodus of Negroes from the South, the educated along with the illiterate and the impoverished.

"Tokenism is still very much the order of the day," wrote Samuel M. Hall, student placement director at Delaware State University, in a letter he circulated recently to 85 campus placement officials around the country and to a score of professional industrial recruiters.

"After only a few years of recruiting blacks on campus," Mr. Hall said, "patterns are already developing where some companies are hiring black employes only to fill vacancies created by other blacks."

Mr. Hall urged that the colleges bar professional recruiters from the campus who failed to hire blacks year after year.

Growing Discontent

Richard C. Clarke, whose New York agency has been recruiting Negro college graduates for industry for 12 years, said there was growing discontent among blacks who had joined large corporations and "found ceilings placed upon their advancement."

"In a way, it's more pernicious than the old system," remarked Mr. Clarke, a Negro, who said his agency processed upwards of 3,000 applications from black college students annually.

"At least under the old system where you were forced to work in the post office you at least knew what rating you could achieve," he said.

He said black men in business and industry were not comforted by the fact that they held positions at a level no black man of past years could dream of attaining.

"He wants to be identified as an individual who makes it on his personal merit," Mr. Clarke said. "He isn't satisfied merely being part of a group success. He wants to be the chief counsel for a large corporation, he wants to be the vice president, and even president.

"I think 1969 is a dangerously uncertain year because of the pressure from the militants who say the graduate who joins a corporation is selling out and the lack of pressure from Washington. In the absence of pressure, industry is going to sit back and do nothing."

Demand Is Strong

Nevertheless, strong demand for promising black college graduates is clear.

"I've been here 16 years," said Walter Hawkins, placement director at Howard University in Washington, "and the only white recruiters we ever had on campus until recently were from Federal agencies interested in technically trained graduates. Now there's a frantic effort here by white recruiters."

C. C. Cunningham, placement director at Florida A&M University, reported that until recently only 18 to 24 concerns regularly sent recruiters to the Tallahassee campus.

"Now some 500 firms make contact here, and they are looking for graduates who can fill jobs right across the board in business and industry," he said.

Evidence of the white collar revolution—a phrase some black militants interpret ironically—can be seen at Morehouse, a 1,000-student liberal arts college whose most famous alumnus was the Rev. Dr. Martin Luther King Jr. (Class of 1948).

Until recently the great majority of Morehouse graduates went into "teaching and preaching," the "safe" black professions. Of this spring's class of 131, only three plan to enter the ministry, six will go into education, and 15 will enter law school, according to William M. Nix, the placement director.

Sixty per cent of the class will go on to graduate school or enter different professional fields, Mr. Nix said.

In the latter group is Mike Holmes, who has turned down the 22 job offers made to him and instead will attend graduate business school next year at Stanford University at Palo Alto, Calif., on a scholarship paying full tuition costs plus $1,700 expenses.

His career plans are simple and reflect the optimism he says shades his outlook for the future. Talk about "black capitalism" at this stage of the Negro's social progress, he says, is simply "ghetto capitalism": making money from blacks by providing services to the black community.

He feels it is essential that he enter the white business world after earning a degree in finance at Stanford, spend five to 10 years learning "white know-how" and then set up a consultant concern using the best marketing and financing techniques to help create small black businesses.

The one disturbing element, he says, is his uncertainty about returning to the South in the future. Of the 50 recruiters who visited the Morehouse campus, only three were from the South. Even at state-supported campuses, which local business tax dollars help support, there was little overt effort to lure the Negro graduate rather than lose him to another region.

"The mood of my friends on campus was that a majority would prefer to remain in the South to live and work, but there simply is no opportunity here for us."

He currently has a $170-a-week summer job with the First National Bank of Atlanta, he explained, but that was the result of a personal encounter with a vice president of the bank, not of a formal recruiting effort.

"I like Atlanta and I think it's one of the best places in the country to live," reflected the somber young man with a trace of a stutter edging his words. "I think the opportunity is going to be here in a few years, and I look forward to coming back home."

OEO Given Grant For Head Start

Washington Bureau of The News

WASHINGTON—The Office of Economic Opportunity announced a $200,585 grant to an Austin organization for continuation of a Head Start bilingual demonstration program.

The grant is to the Southwest Educational Laboratory, which will enroll 90 Mexican-American children from 3 to 5 in a bilingual early childhood education program.

Parents of the children also will be involved in the program.

JOBS FOR POOR
(Continued)

in this program," says Tom Amatucci, owner of Amatucci Rambler in Hillcrest Heights. "Those people don't have any idea of what's needed to save this city. Every time there's trouble, what do they say — just more cops, more guns, more jails."

"Though 2312 disadvantaged persons are currently holding NAB-created jobs, about as many have dropped out somewhere along the way.

Another emerging pattern is that performance and employment retention of disadvantaged recruits tend to deteriorate when the employer does not supplement job training with counseling, attention to personal problems and other supportive services.

Early in the program, the Washington Job Center, which trains unskilled persons for a variety of NAB jobs through a Labor Department contract, discovered that one of its courses — cooking — was a dead end. Most graduates who became apprentices in restaurants quit their jobs within a few weeks. Low pay, bad hours and transportation difficulties were the reasons. The cooking course was abandoned.

In the balance, however, NAB officials feel they have taken substantial forward steps: Private industry, goaded from all quarters including the White House, is now involved; more than 2300 disadvantaged persons currently hold jobs at higher pay than they have known before and all have been promised an opportunity to advance.

Profiting from past lessons, NAB hopes to involve more businesses in the future and to attain additional job quotas of 6000 by June 30, 1970, and 10,000 by June 30, 1971.

NAB, created at the urging of former President Johnson and headed by Henry Ford, solicits job pledges from private business and coordinates training and recruiting activities.

Recruits are "certified" as hardcore disadvantaged under a specific set of written standards. Each applicant is eligible only if he:

- Is below the poverty income level set by the U.S. Office of Economic Opportunity ($3300 annually for a four-member family, $1600 for a single person).
- Does not have "suitable employment," that is, does not have a job but is actively looking or is working part time or below his skill capacity.
- Is either a school dropout, under 22 years old, over 45, handicapped, lacks a marketable skill or is a member of a minority group.

Recruits are certified by the U.S. Employment Service, the United Planning Organization and other centers that refer the recruits either directly to participating NAB firms for on-the-job training or to the Washington Job Center for formal classroom instruction, prior to job placement.

Ted Habarth, NAB procurement and placement manager, acknowledged that some firms have a flexible view of the certification standards and take more highly qualified and reliable recruits than might be considered hardcore.

The companies do this, he said, to allay possible problems of "racism and bigotry" among old line white employes.

"If they don't have any trouble, then by degrees in the future, they hope to start recruiting the more disadvantaged people," he said.

"At first we were recruiting the damndest bunch of junkies, drunks, boosters and hustlers you've ever seen," said Bill Deising, accountant at the Washington Job Center. Most had been referred to the center by UPO employment centers, he said.

"They were not really seeking training and employment," Deising said. "A lot of them were 17- and 18-year-olds just looking for summer work. When fall came, we had quite an exodus."

He said, "Now we're getting more referrals from USES, the churches and the D.C. Corrections Department. They screen the recruits more carefully . . . We have an older, more stable and more motivated group now."

The Job Center, at the site of the old National Training School in far Northeast, operates on a $5.6 million, two-year contract between the Metropolitan Washington Board of the Trade and the Labor Department.

The contract requires the Board of Trade to keep 1400 training and job slots filled for one year. Recruits undergo four to eight months of classroom and shop training at the center and are then placed in jobs.

Deising estimated it will take 2500 to 2800 recruits to keep the 1400 slots filled for 12 months. The dropout rate is high during training but declines after recruits are placed in jobs, he said.

At present, he estimated, there are about 800 Job Center graduates in NAB jobs, accounting for almost one-third of the NAB total of 2312. Another 300 are unemployed while the center continues trying to place them, and 250 are considered unplaceable because of social, drug or other problems.

About 600 have dropped out or cannot otherwise be accounted for, he said, and 500 are still undergoing training, most of them in the building and maintenance trades. Others are being trained in automotive and clerical work. Recruits are paid $1.60 an hour during training and receive incentive raises, bus tokens and meal tickets for punctuality and superior work.

After they are placed in jobs, counselors keep in touch with them and help them iron out personal problems on the job or at home.

Most NAB recruits do not come through the Job Center but go directly into on-the-job training with NAB firms.

About 50 of the 317 participating firms, including several consortiums formed by businesses in the same field, have signed individual contracts with the Labor Department to fund training costs. Current contracts total more than $4 million and are designed to provide training for more than 1400 recruits.

The firms without Labor Department contracts provide training at their own expense but generally have smaller groups of recruits and shorter training periods.

Giant Food Inc., for example, has a $142,534 contract to hire and train 100 persons. Safeway Stores Inc., on the other hand, has no contract and is working with 45 recruits.

The recruits themselves indicated in interviews that they are generally pleased with the NAB program.

Reginald Anderson, 22, an 11th grade high school dropout who had been working as a laborer for the District government, is now a food clerk for a Safeway store at 17th Street and Benning road ne.

"It's steady work with good benefits," he commented. "They say there are good career opportunities, too."

Another food clerk at the same store, Calvin Jenkins, 32, who had worked as a trained barber for seven years, switched jobs "because I got tired of the long hours in the barber shop and wanted a regular eight-hour day," he said. "Now I've got it."

Safeway food clerks start at $118 a week and get to $143 after two years.

"After three to five weeks," said Safeway employe representative John Mack, "the guys in this program perform as well as regular employes."

One of the most ambitious and successful programs in the Washington area is that at Amatucci Rambler, the American Motors sales and repair shop on Branch Avenue in Hillcrest Heights.

With a $99,346 Labor Department contract, owner Tom Amatucci has 20 inner-city men undergoing 12 months of intensive training as apprentice mechanics.

Amatucci has combined the training process with extensive counseling and a close personal touch to maintain a high retention rate among the recruits: Only three of the original 20 taken in last summer have dropped out, and they have been replaced. Daily attendance is almost 100 per cent.

Amatucci and his staff know the 20 trainees individually. "All these guys have some kind of a personal problem, whether it's drinking, dope or a broken family," he said. "Eighty per cent of them have criminal records . . . Sure, we have hostilities and flare-ups, including racial ones, but we work them out right here in the shop."

The trainees are "remarkably fast" in learning the basics of mechanics, Amatucci said. Under the strict tutelege of veteran District school teacher J. L. Hunter, the trainess undergo daily theory classes requiring the use of fractions, algebra, geometry and square roots.

Assisting Amatucci in counseling and other supportive services is the Opportunities Industrialization Center (OIC), an inner-city self-help organization with staff members trained to handle the personal problems of the disadvantaged.

Recruits are initially processed by OIC for eight weeks of orientation in the daily work world, remedial instruction in mathematics and an introduction to Negro and other minority histories.

After the eight weeks, the recruits go daily to Amatucci's shop in Hillcrest Heights, attend class in the morning and do practical shop work with Amatucci's journeyman mechanics in the afternoon. If any of them is tardy or absent, an OIC counselor seeks him out in the city, helps him cope with whatever problems he may have and gets him back on the job.

While training, they receive $1.60 an hour, "but I'll start any of them who stay with me after the 12 months at $2.36," Amatucci said. Journeyman mechanics earn $4 an hour but must have five years' experience to reach that status.

Amatucci feels he is alone in much of his effort and is appalled at what he considers the indifference and isolation of the community around him.

Not only have banks refused to lend him money against his Labor Department performance contract, he says, but fellow dealers and the Automotive Trade Association of the National Capital Area have shown no interest in cooperating with him in a joint venture to expand mechanic training facilities for the inner-city poor.

Also, he says, the Prince George's County Commissioners have offered no help nor suggested sponsoring any programs, despite his pleas.

"They come around here and look at my program, slap me on the back and say, 'Nice job, Tom'—and that's it," Amatucci said. "When are we going to learn?"

Medical Care Costs

MEDICAL CARE COSTS rose in May to 154.5% of the 1957-59 average from 153.6% a month earlier. These costs are components of the Government consumer price index.

More Black Reporters Leave the Negro Press For 'White Media' Jobs

* * *

New Employers' Racial Coverage Benefits; One Atlantan Quits Family Paper for Radio Post

By ART SEARS JR.
Staff Reporter of THE WALL STREET JOURNAL

Reporter Stan Scott could one day have become publisher of the Atlanta Daily World. The newspaper, oldest of the four U.S. dailies aimed at Negroes, is owned by his family.

But Mr. Scott, now 35, decided security wasn't enough. He quit the Daily World and went to work for what Negroes regard as the "white media." He became the first black staff reporter for United Press International and later moved to his present job as as well-paid reporter for New York's WINS, an all-news radio station.

Mr. Scott is not alone in his decision to abandon a black news organization for the largely white-oriented mass media. A growing number of black journalists are making similar moves—much to the delight of the mass media executives who hire them and much to the distress of the black-media executives who are losing them.

Demand for black reporters is so great that many mass-circulation publications and broadcasting companies have "standing invitations" out for Negroes, says Dean Richard T. Baker of the Columbia University Graduate School of Journalism. Some employers, unable to find experienced black reporters, are even sending potential newsmen to journalism school.

Covering Black Militants

One reason news executives want black reporters is that they feel they can't effectively cover the current racial upheaval without them. "It's no secret that black militants don't like to deal with white reporters," says Henry Schnaue, news director of WINS and Mr. Scott's boss. "Stan can move more easily in situations involving militancy."

Editors also acknowledge that most newspapers and broadcasting stations have been remiss in failing to hire Negroes in the past. A. M. Rosenthal, associate managing editor of the New York Times, says his paper has "happily reached the point where I don't know exactly how many black reporters are on the staff." He estimates, however, that there are about a dozen—and adds that the Times now does a better job of covering civil rights stories as a result.

Surprisingly, many of the reporters who make the move to white-dominated media say they are doing so because their new employers' coverage of black problems is better than that of the black press. The black press "gives one too narrow a view of the city and its problems," says Betty Washington, a 33-year-old mother of four who recently quit the Chicago Defender to join the Chicago Daily News. "I've gained a greater feel for the black community by learning more about the whole city," she says. "I had never before picked up a phone and called a Polish alderman or covered city hall."

Moreover, journalists who join the mass media also often find that they are actually reaching more black readers or listeners than they could through the black media. Most "white" radio or television stations, for instance, have large audiences among Negroes in their areas as well as among whites.

Preparing for Jobs

To increase the number of black reporters, Columbia last year started a Ford Foundation-supported summer school in broadcast journalism for black students. This summer the program was expanded to include newspaper and magazine journalism as well, and enrollment was increased to 35 from 20. Many of the students attending the school this summer already hold clerical or other nonreporting jobs at newspapers or broadcast stations, and most have been promised regular news jobs after they graduate from the 10-week course. The 20 who attended last summer all got jobs in the mass media.

For the 172 black newspapers and the handful of black radio stations in the country, the loss of reporters to the mass media is a serious blow. But many reporters blame the problem on the black media themselves.

Mr. Scott says, for instance, that he found the Atlanta Daily World "too conservative" in covering black affairs. "It wasn't aggressive enough in reporting and interpreting issues of the day for its black readership," he says.

The movement of black journalists isn't entirely one way, however. Occasionally, after getting a taste of life in the mass media, one decides to return to the black press. Among those who have done so is Simeon Booker, now Washington bureau chief for Ebony magazine. In the early 1950s, he was a reporter for the Washington Post—the first black reporter for the paper. But he left the Post to set up Ebony's Washington bureau. "I've never been ashamed of the black press," he says.

FOR RELEASE: Sunday Editions, July 6, 1969,
or thereafter

ATOMIC ENERGY WORKFORCE EXPANSION MARKS SOUTHEAST

Employment in the atomic energy field has risen steadily in the Southeast for the past three years, according to Brunswick A. Bagdon, Southeastern Regional Director of the U.S. Department of Labor's Bureau of Labor Statistics. Between 1966 and 1967, employment increased from 21,162 to 21,902, or by 3.5 percent. A further increase of 6.0 percent was registered from 1967 to 1968.

Some 23,200 persons are employed in the atomic energy field in the Southeast. In May 1968, the 6-state region accounted for 16.4 percent of the 141,700 workers in the United States who spent at least 50 percent of their time on atomic energy activities.

Employment in the Atomic Energy Field in the Southeast, by State--Total and Selected Occupations--May 1968

State	Total	Engineers	Scientists	Mathematicians	Technicians	Others
Tennessee	15,872	1,622	1,597	251	2,032	10,370
South Carolina	5,766	546	350	22	750	4,098
Florida	1,430	235	36	23	193	943
Georgia	121	46	8	0	27	40
Alabama and Mississippi	27	3	11	0	1	12
Total	23,216	2,452	2,002	296	3,003	15,463

One of every three regional atomic energy workers was either an engineer, a scientist, a mathematician, or a technician. This high proportion of professional and technical workers is due to the importance of research and

development activities in the atomic energy field. Physical and life sciences employed 2,002 scientists in the Southeast. Physical scientists numbered 1,512 and life scientists, 490. Chemists were the largest single group with employment of 855 followed by physicists with 491 and biologists with 292. Overall, about 7 of every 10 scientists were engaged in research and development activities. Work in the atomic energy field required 296 mathematicians. About 60 percent of these, or 177 mathematicians, were involved in R & D work.

The 2,452 engineers employed in Southeastern atomic energy activities represented virtually every aspect of engineering work. Reflecting the many engineering problems requiring unique solutions, 2 of every 5 engineers were in research and development. Mechanical engineers numbered 710 with 208 of these in R & D. There were 506 chemical engineers with 257 in R & D and 504 electronics and electrical engineers; of whom 247 were in R & D. Civil engineers numbered 124 and metallurgical engineers, 111.

There were 159 nuclear and reactor engineers--one of the smaller of the engineering groups. The occupation is, however, unique in the engineering field. Nuclear and reactor engineers utilize their skills in reactor design, manufacture and operation; they develop and evaluate concepts in these activities; and they provide guidance in reactor technology to other scientific and technical personnel. More than half of these engineers were in R & D activities.

About 13 percent of all atomic energy employees in the Southeast--3,003 people--were technicians. This occupational group registered a 3 percent gain over the previous year. Technicians work throughout the atomic energy field performing duties as varied as the scientific and professional activities which they help support.

The data presented here are based on the annual surveys of scientific and technical personnel in the atomic energy field, conducted by the Bureau of Labor Statistics for the Atomic Energy Commission. The survey was designed to include activities directed at the development and use of atomic energy. Therefore, the atomic energy field cuts across many industries. Nonprofit and Government-owned, contractor-operated establishments, as well as privately-owned industrial establishments, were included in the survey.

Labor Letter

A Special News Report on People And Their Jobs in Offices, Fields and Factories

CAREER SWITCHING grows as executives seek more money and job satisfaction.

Many executives are jumping into new careers in the securities, computer and consulting fields, reports Sturm, Burrows & Co., a Philadelphia recruiter. The 38-year-old personnel manager of a big Eastern manufacturer quits to become a minister. Ernest Arbuckle, the chairman of San Francisco's Wells Fargo Bank who formerly headed the Stanford Business School, says he believes in switching careers every 10 years.

"Most career-switching is financially motivated," opines one executive recruiter. Yet a former Washington lawyer turned psychoanalyst says he switched "to do a more personal kind of work with people." Donald Elliott, a Memorex Corp. vice president, previously spent five years as a Peace Corps administrator "as an exciting change of pace." The University of California Business School retains a consultant on mid-life career switching.

C. L. Carter & Associates, a Dallas consultant, warns that career-switchers can end up "holding the bag in some job they're not prepared to handle."

* Mo Prof & Tech -

URBAN EXPERTS shun jobs with cities for higher-paying work in industry.

Shortages of planners, engineers, pollution specialists and other experts plague many big cities. St. Louis, operating with "skeleton" staffs in most departments, seeks to fill 60 vacancies, 50% more than five years ago. In Cincinnati, a $16,000-a-year opening for an air-pollution control supervisor goes unfilled for six weeks. "The sharp, young city planners" are enticed by the better pay and greater challenge of private consulting, one urban expert claims.

Cities hunt harder for talent. Cleveland says a 10% boost in salaries has helped it rehire some former employes and attract young people. Cincinnati, which now recruits nationwide, has boosted its personnel-advertising budget 25% in two years. Milwaukee offers more applicants expense-paid trips to the city for interviews. New York streamlines its recruiting; engineering grads are hired on the spot during weekly "walk-in days."

* * *

TRAINING PROGRAMS to upgrade workers' skills get a stronger push from unions.

The Drug and Hospital Employes Union and public hospitals in New York set up a program to train nurse's aides, orderlies and other low-skilled workers for such jobs as lab technician and licensed practical nurse. The training will be financed by hospital contributions. The State, County and Municipal Employes Union puts the finishing touches on a "hospital career development program" to upgrade workers in Boston, Cleveland and Milwaukee.

Unions outside the hospital field also are active. The Laborers Union provides skill training for over 4,300 workers with $4.1 million in Federal funds. The carpenters and painters unions have Federal contracts to train journeymen in new construction techniques. Some unions find that Federal funding spurs the growth of privately financed upgrading programs.

Railroad unions and employers map plans to offer 2,000 workers training in basic educational skills.

ALA

* * *

TELEPHONE WORKERS in Pennsylvania seek to affiliate with the new Teamster-Auto Worker alliance. The 12,000-member Federation of Telephone Workers of Pennsylvania, an independent union, is the first to apply formally for a hookup with the Alliance for Labor Action. The ALA is expected to accept the application at a meeting July 16.

* * *

TEEN ROCK'N'ROLLERS face "vicious exploitation," the Musicians Union charges. It aims to get more young musicians to join the union for protection from unscrupulous booking agents who cheat and underpay them. The union also plans to offer youngsters free advice on booking practices.

* * *

SHOE WORKERS HAMMER away at rising imports. The Boot Workers Union urges negotiators to seek contract clauses requiring U.S. manufacturers, who also purchase foreign shoes for sale to retailers, to pay a "royalty" of 5 cents on each imported pair. The money would be used to promote the sale of domestic union-made shoes.

* * *

ORGANIZING CABBIES: An affiliate of the Seafarers Union launches a major drive to organize nearly 2,000 taxi drivers and taxi workers in the Boston area. The union already bargains for about 10,000 cab-industry employes in other cities.

* * *

UNION DUES keep rising as activities expand and costs increase.

The Utility Workers Union boosts dues to $1.25 monthly from $1 to finance an organizing drive and build its strike fund. The Insurance Workers Union raises its monthly dues to $5 from $4. Many AFL-CIO state organizations lift their dues. The Pennsylvania AFL-CIO increases its head tax to 10 cents a month from seven cents, while Michigan's tax goes to 13 cents from 10 cents.

The AFL-CIO is likely to ask delegates to its October convention to boost the monthly tax that unions pay on each member to nine cents or 10 cents from the current seven cents. An increase is needed, staffers say, to pay for the federation's new labor college and annual voter registration drive. Loss of the Auto Workers Union also tightens finances.

The Boilermakers Union considers making dues increases automatic by tying them to the wage level of the membership.

* * *

THE CHECKOFF: "A tisket, a tasket, don't get caught dead in a Pine Bluff Co. casket." That advice was offered by a labor newspaper during a recent strike by the United Furniture Workers against Pine Bluff Casket Co. in Arkansas. . . . Ageless Jack Benny gets his second "life" membership card in the Musicians Union. . . . A former Iowa State University football player files a claim for workmen's compensation as a result of a football injury he allegedly received when he was on a full athletic scholarship.

Law Students Urged to Learn Slum Life

By MURRAY ILLSON

A Federal judge has suggested here that law students "from privileged backgrounds" be required to live and work in slum areas "for a number of weeks or months" to understand the people they may enventually have to deal with.

The suggestion was made by Judge Jack B. Weinstein of the United States District Court, Eastern District of New York, at a meeting of editors of The Columbia Journal of Law & Social Problems. Judge Weinstein is a 1948 graduate of the Columbia School of Law and is an adjunct professor of law there.

The judge told the editors at the meeting, in the university's Butler Hall on Wednesday, that many law students he had interviewed as prospective law clerks had "grown up in the suburban areas and then moved on to good colleges and law schools and then to clerkships and legal offices of one kind or another."

"Even should they be in touch with poverty through a case," he said of the students, "it will be as an expert looking down to help rather than as the participating individual who has lived in a slum and smelled urine in the halls and feared for his life as he walked the streets after dark.

Not Something New

"This limited worldly experience of law students is not a new phenomenon. It appears to me to be more troubling now than it ever was, perhaps because the decisions that will be made by lawyers and their clients in government and elsewhere seem to leave less room for errors of judgment involving incorrect assumptions about the real world.

Conway

Judge Jack B. Weinstein

"Society is becoming increasingly tightly organized, interdependent and volatile. Mistakes of judgment which heretofore might have passed almost unnoticed in view of the variety of relatively small random forces operating, now have a greater impact as effective forces become more tightly integrated and relatively more powerful."

Judge Winstein suggested, for example, that at Columbia "some students might live at least one month in a Harlem residence with a family of limited resources" and that students who come "from families of limited resorces might be boarded on the Lower East Side."

He acknowledged that there were "dangers involved in this kind of program."

"Some students," he said, "might be subject to abuse and possible physical danger. Moreover, the local community may resent being treated as if it were some society of foreign natives being studied by an anthropologist."

Expense a Factor

Noting that his proposed program would have "very substantial logistical and cost difficulties," Judge Weinstein said Columbia University had "major physical advantages because of its location."

"In addition," he said, "for some years Columbia has sought to encourage students of diverse backgrounds to enter the law school. It can call upon a number of its own graduates and undergraduates to assist in the program."

As to the possibly practical results of his proposed program, Judge Weinstein observed that there was "a certain humility that comes from pushing a garment cart through the middle of downtown Manhattan on a hot summer day or of working in a hospital or in a taxicab and of living in a slum area."

And he added: "Dealing on an equal level with miserable people, with nice people and with mixed people in unfamiliar areas of life may help suggest why some pleasant-sounding theory will not work."

WEEK OF FEBRUARY 22, 1971

BLACKS DON'T BECOME ENGINEERS
DESPITE THE LONG-TERM NEED FOR THEM

WASHINGTON -- Few blacks are going into engineering despite a strong long-term demand for the services of this profession, a research study of the Labor Department's Manpower Administration has found.

Last June, only 750 black engineering graduates left college campuses to join the Nation's one million professional engineers. And no more than 2,000 blacks received their two-year engineering technician certificates that year.

The study also found that:

-- Only two percent of all engineering students are black, and about half attend six predominantly black universities.

-- Only five percent of all engineering-technician students are black.

-- There has been virtually no increase in the number of black engineering students in the last eight years except in a few special programs.

The report underscores the discrepancy between increasing demand for engineers and blacks' apparent reluctance to enter the field. Forecasts by the Labor Department show "rapid long-term growth in demand for engineers and scientists." And Office of Education projections show that the supply of engineers will fall short of demand during the rest of this decade, despite the current short-range decline in job opportunities.

The study concludes, however, that "there cannot be complete intergration of the blacks into engineering until this same inte-

(MORE)

gration and acceptance takes place in society as a whole."

Probable reasons for the lack of interest in engineering by blacks is failure of anyone to answer questions about the profession, and discrimination by engineering employers, the study found.

It also reported that most black engineers and technicians liked their jobs but many were critical of their employers whom, they believe, hired them to fill some quota. They also were concerned because they felt their progress in the organization might be limited.

The study's recommendations for increasing the numbers of black engineers and technicians include:

-- Better guidance counseling and preparation in mathematics and science for black high school youth.

-- Industry sponsorship of black engineering students, with summer and other vacation employment and a job offer upon graduation.

-- Industry support of supplemental guidance programs in secondary schools for technically-minded black students.

-- Government and university support of special programs to attract minority youth to an engineering education.

-- Continued Government support of predominantly black universities with engineering programs.

-- More exchange of ideas between students, faculty, administration, and placement personnel of "black"

(MORE)

and "white" universities.

-- A requirement that engineering and technician schools maintain statistics on students by race.

The study was conducted by Dr. Robert Kiehl, Foundation for the Advancement of Graduate Study in Engineering, Newark College of Engineering, Newark, New Jersey.

Data came from administrators of universities enrolling over half the engineering students in the U.S.; deans of the seven predominantly black universities offering engineering courses; administrators of over half the 680 recognized technician training institutions; and 295 black graduates of the class of 1968 and 1969 of the engineering and technician school.

This research was funded by the Manpower Administration of the Department of Labor as part of its continuing efforts to gain knowledge on the training and employment of the Nation's work force.

EDUCATION

Unions woo the college faculties

More and more teachers are signing up to increase their pay and power

Since the mid-1950s, university and college faculties have employed a somewhat oblique technique to insure salary increases. The American Assn. of University Professors has merely graded institutions on how well professors are compensated—and then published the ratings. Any school that wanted to keep a good faculty could not afford to let its pay scale fall behind the parade.

Now, professors are abandoning such dignified but timid attempts to shame college administrators into granting raises. Some 15% of all college teachers have signed up for membership in unions or quasi-unions operating at more than 100 institutions.

"Three or four years ago, unionization was an anomaly," says Allan Ostar, executive director of the 277-member American Assn. of State Colleges & Universities. "But it's moved quickly into community colleges, is now in the four-year state institutions, and my guess is that it will hit private universities."

Troubles. Professors are worried about three things: their salaries, their role in administration, and their job security. In the 1960s, when education enjoyed broad support, the salary guides were the AAUP's rating scales of three categories, with up to 10 ranges in each category. These were set up so that a professor in a junior college would be paid less than one at a four year college or a university. The faculty was almost preeminent in saying what went on in the school, and professorial prestige was great. Tenure was secure, and chronic teacher shortages assured the professor a position.

Unionization has been catching the eye of some faculties since the mid-1960s. Last year, teaching salaries barely kept up with the cost of living, and the recession and loss of research contracts further cut income. Now there is a sudden glut of PhDs, and professors are even more susceptible to union charms.

Organizers. The major organizations competing to sign up faculty members include:

- The American Federation of Teachers (AFT), an affiliate of the AFL-CIO whose stronghold is in community colleges, which are virtually "grades 13 and 14"—of those school systems that have highly remunerative union contracts. The AFT recently led a strike in Chicago's community colleges.
- The National Education Assn. (NEA), which has dominated the elementary and secondary public school system and has the greatest organizational, financial, and lobbying resources of any group. The NEA is signing up state colleges that evolved from the old teacher's colleges and community colleges where faculty tend to have public school backgrounds.

Administrators fear the spread of strikes, like this one in Chicago.

- The American Assn. of University Professors, which has traditionally limited itself to strictly professional considerations. Its position on collective bargaining, says its national president, Professor Stanford Kadish of the University of California, has only recently changed from "no, never" to "sometimes." The AAUP has beachheads at Fordham and at Rutgers.

Unionization could change not only the professor's standing, but his employers' costs. In the few contracts signed so far in four-year institutions, salary raises have been no higher than they would have been without a contract. This is usually the case when a union first takes hold, and it is the future which counts.

However, faculty salaries have doubled in five years at the seven Chicago community colleges that have been unionized. Because of the latest 20% increase, the schools will have to cut back on both faculty and students unless more state funds are forthcoming. And Donald Keck, the NEA's associate director for higher education, cites one community college where faculty salaries rose 30% in one year after unionization and others where salaries increased 25% over two years.

Unions, says AFT's Richard Hixon, are not about to back off from their demands, despite the budgetary woes facing colleges: "They can't load off their problems on the backs of teachers." Keck says that teachers "will have to work both sides of the street—bargain and lobby the legislatures, too."

Unionization is causing distress outside of college finance offices. Harvard professor David Reisman, for one, fears the dissolution of the academic community if teachers adopt what he calls a "high-level civil service mentality." On the other side, Donald Wollett, a labor law professor at the University of California at Davis, who has negotiated teacher contracts, feels that collective bargaining will become "the primary vehicle for faculty participation" in governing schools.

Dwindling role. Power, as much as pay and tenure, is what professors hope unions will bring. In the aftermath of the campus disorders, legislators and trustees have played a larger role in schools, and have reduced funds for publicly supported colleges and certainly spattered the image of the faculty. Not only are legislatures now grumbling about tenure; students are even sitting on tenure committees.

In addition, states with enormous systems and central administrations are draining power from the faculty on campus. "The campus begins to look like a branch office," says Columbia historian Walter Metzger. "It's not a dean, but an accountant who makes the decisions." Faculties, "frustrated with the rhetoric of shared decision-making," as the AFT's Hixon puts it, expect that bargaining can include a role in campus administration.

New frontier...

in storing the world's oil

The Petroleum Industry has always been willing to invest heavily in sound new concepts. In any facet of operations.

That's why getting oil from offshore wells to refineries needn't be so much trouble these days.

CB&I's development of undersea storage tanks allows ship loading almost on top of the wells.

This eliminates onshore tanks, long pipelines and docks. The saving is tremendous.

CB&I

Chicago Bridge & Iron Company

Oak Brook, Illinois 60521. Offices and subsidiaries throughout the world.

lation allows bargaining are organized, and decisions of the National Labor Relations Board are opening the way in private schools. In 1970, the NLRB recognized unions at private institutions, and then last week the board sorted out which professionals may join a union and which may not. In effect, deans and divisional chairmen are management, and the professors are not and are free to join unions.

New view. "The era of Mr. Chips is over," sighs one educator amazed by the demise of "professionalism." Labor organizers are not. Gus Tyler, assistant president of the International Ladies Garment Workers' Union, says: "You can't separate the professor from the rest of society. Any group that's aware of its collective identity asserts its power, period." Moreover, says William Bowen, Princeton's provost, "any

Kadish reluctantly embraces unionism, which Cartter thinks will spread.

group with its real income going down worries whether its interests are sufficiently taken care of."

While faculty salaries rose 75% in the 1960s, the past year's financial plight dictated "no or low" salary increases at a time of rampant inflation. The average salary for a union member in the graduate division of the City University of New York is $27,594. CUNY is the very top bracket of the AAUP's salary ratings, and so is Princeton, but its average for all faculty members is $18,539. The publicized increases in public school systems, says one administrator, "clearly whets the appetite." But the private schools might not be able to raise tuition to meet a union contract and organizing a fundraising drive for that purpose would be rough.

Another attraction that unions hold is to fight for job security. "Up until a year ago," says Allan Cartter, chancellor of New York University, "not many were worried about job security." Now Cartter sees a real slowdown in what had been a tremendous expansion of the profession. This means there will be a large number of young faculty members, unprotected by tenure, who "do not see 'the professor, the elite' as a shimmering notion" in an age of equality. Since they do not yet have books or reputations to bargain with, they have no professional qualms

TAKE THE CEILING OFF YOUR EARNING POWER!

Here is a lifetime business opportunity with exciting PROFIT POTENTIAL.

The "knowledge industry" today accounts for about 30% of the G.N.P. We are a pioneer and leader in this industry. Our international, publicly held company serves individuals, companies of all sizes, industry, and municipal governments with programs and courses on leadership and management development, personal motivation, sales training, and individual and family achievement.

We provide complete training and an exciting incentive and awards program. Sales, management, engineering, and business leadership backgrounds desired.

The issue of teacher productivity

"I can't think of any other industry where the more experienced are less productive for more money," says Rexford Moon, vice-president of the Academy for Educational Development, Inc. Behind his statement lies the academic tradition that apportions the least teaching to the most prestigious professors.

This issue—the question of class loads—has not yet been subject to more than peripheral notice in union bargaining. But it did figure in the Chicago community college strike, and its time is coming.

The average class load has been decreasing over the past 15 years, making teaching "not a bad calling," says one professor. Joseph Garbarino, a Berkeley professor, says: "The way to get somebody you really want when you can't match salaries elsewhere is to offer him a reduced teaching load." The American Assn. of University Professors recommends six hours per week for professors in universities, nine hours in colleges, and 12 in community colleges. But some teachers may carry as little as four hours.

Proportion. Moon, who has studied the problem, finds that the proportion of tuition necessary to pay professors' compensation at one institution jumped from 59% to 79% in 10 years. Moon argues that to continue salary increases, faculties will have to increase "classes taught."

Educators, however, are quick to explain that class load and work load are not synonymous. Columbia Professor Walter Metzger says that a Nobel laureate earning $30,000, who works full-time with eight graduate students who pay a total of only $24,000 in tuition, "may not do much for the finances of the university, but does an immeasurable service for the nation." And, of course, he brings research and consulting contracts to the university. Princeton's Provost William Bowen maintains that "those that do get paid the most work the hardest—nights and weekends, too, like young pediatricians."

In a typical day recently, Charles Berry, associate professor of economics at Princeton, reviewed a book, composed two PhD examinations, worked with students on a computer game, participated in examinations for masters' candidates, attended three committee meetings, and counseled a student who was failing. Along the way, he missed his lunch, and after dinner returned to the campus to work out a new program for the computer game. His class load: six hours a week. The emphasis on faculty-guided, independent student work also obscures the amount of time teachers really spend with students, and the American Council for Education's Logan Wilson says that "most aspects of professorial work don't lend themselves to a quantitative evaluation—there is no per unit cost like an industrial model."

Nevertheless, Michigan and New York have set a regulated number of "student contact hours"—time spent in classroom and counseling. California has done the same thing by simply adding more students, but not more faculty. Kerry Smith, chief executive officer of the American Assn. for Higher Education, predicts this is doomed to fail because it is "artificial and arbitrary."

Productivity. Allan Ostar, executive director of the American Assn. of State Colleges & Universities, feels that collective bargaining may promote "productivity clauses" like those in industrial unions. Bargainers would obtain a trade-off: higher salaries for more work by professors. But there is no general agreement on how to set up standards for such "productivity."

In any case, work loads are beginning to become a bigger issue as the financial crunch becomes more critical. And, says education writer George Bonham, if the professors do not realize that their demands shape the institutions to which their own destinies are tied, and they drive down class loads, "they will perfect a self-destruct mechanism."

about joining a union—and considerable economic incentive to do so.

Tenure. Job security is an even bigger issue because tenure is under scrutiny. With the squeeze on expansion and budgets, schools are worried about aging faculty members who cannot be removed because they have tenure. Critics hold that tenure only protects the incompetent. Many trustees and legislators feel it hampers their flexibility in running schools.

Many administrators fear that the unions will take up the cause and, through grievance procedures, make it very difficult for a college not to renew contracts. And the AFT has contracts where "nonrenewal" is subject to arbitration already. On the other hand, Nicolas Falcone, who is leading Fordham

NORTHAMPTON
a new town in the shadow of the Nation's Capital

Northampton is closer to Washington than any other new town! Only 3 miles from the District Line. Reston, Va. and Columbia, Md. are about 15 miles away. That's just for starters. Northampton fronts on the Capital Beltway. It's minutes from any part of the Metropolitan Area. Take Exit 33 and you are there.

Growth rate in the Washington Metropolitan Area from 1960 to 1970 was the greatest in the Nation. 38.4%! Prince George's County, where Northampton is located, gained 84%! Far and away the highest in the area. And the County has a modern, new, streamlined form of government to meet these challenges, now and for the future.

The 2800 acre new town package planned at Northampton includes everything from a 27 hole golf course to the Prince George's Community College, a 300 acre town core with commercial, office, and hotel-convention facilities, a center for government, and a complete variety of residential uses. Phase I is under way.

A *planned* new town. Close-in. On the Beltway. In the fastest-growing county in the Nation's fastest-growing market. That's Northampton, Maryland.

To get the facts, write to: William J. Levitt, Jr. Chairman of the Board, Northampton Corporation, 1828 L St., N.W. Washington, D.C. 20036. Phone: 202-223-6505

NORTHAMPTON CORPORATION — *A Wholly-Owned Subsidiary of DISC Incorporated*

faculty members in their efforts to unionize, says he sees administrations "getting rid of good teachers for the purpose of saving money."

It also is not lost on the professors, says American Council for Education President Logan Wilson, "that there's been a lot of jockeying in organized interest groups for better pay and conditions, and that the unorganized come out with the short end of the stick."

So far, few contracts have been negotiated, so few patterns have been established. While CUNY's Mintz says everything from salary to parking space has been covered, financial considerations generally head the list.

While many teachers look to the CUNY salary schedules as indications of what collective bargaining can bring, the CUNY figures actually put salaries no higher, relative to those in the public schools, than they traditionally have been. More important, say faculties, is the resolution of salary inequities and assurances that promotions will not be delayed to lower costs.

> Most schools are wary of unions and want to keep them at arm's length

What they think. A few administrators have favorable things to say about unions. Dean Joseph Orze, chief negotiator for the University of Southeastern Massachusetts, feels that unionization has clarified the responsibilities on both sides of the fence.

On the other hand, most schools would like to keep the unions at arms length. William Weinberg, vice-president of Rutgers, the state university of New Jersey, emphasizes that the university has been careful not to develop an "adversary relationship" with the union, and, like others, it has strengthened the traditional avenues of faculty power.

Fordham, a private institution, granted its faculty large raises this year, which many felt was a none-too subtle way of heading off union activity. "Unions polarize just at the time when schools need all the cooperation they can muster," says Harry Marmion, president of St. Xavier College, summing up administration fears.

Schools worry about the possibility of strikes. One has already occurred in Chicago, another in Philadelphia, and a third, in Wisconsin. And in California, various groups backing legislation to permit unionization threaten to refuse "to teach in dangerously overcrowded classrooms" if cutbacks in school budgets are not restored. A strike could be even worse for private institutions. Says Cartter: "If a school shut down a month, it could go bankrupt. It's not quite like a factory, where overtime can make up last month's production."■

Current Job Systems

The following briefly describes the operations of three computer-based employment systems currently in operation in the United States. The three are:

The Job Bank - located in Baltimore, Maryland and operated by the Maryland State Employment Service;

The Automated Placement System - located in Salt Lake City, Utah and operated by the Utah State Employment Service;

The On-Line Placement System - located in Madison, Wisconsin and operated by the Wisconsin State Employment Service.

Of these three systems, the ones in Utah and Wisconsin are fully automatic, the Baltimore system only semi-automatic.

Baltimore - The Job Bank started operations in June of 1968. The motivation for starting this computerized system stemmed mainly from a desire to control the number of job applicants seeking work with any one employer. Previous to the system, employers complain that too many applicants sent by too many private agencies were seeking work.

In the system's first year of operation, 66,741 job referrals were made. Of this number, 18,729 people were hired by employers or placed in training programs; 6,842 of this group were hard core unemployed. About 23,000 persons are currently on file as being unemployed but only about 4,000-5,000 persons are seeking full-time employment.

Since its start, about 22,000 employers have used the system. From 5,000-10,000 employers regularly use the system. On any one day, these employers will be seeking applicants to fill 8,000-10,000 jobs.

Computer Operation - The Baltimore system is computer-based only to the extent that current job openings are stored in a computer. Each day job openings are telephoned in to an 11-man Job Taking Unit by employers. Each job is assigned a code number (using the DOT six digit code), keypunched and stored in the computer. That evening all current jobs are automatically printed by category and bound together as the "Job Book" (see example, next page). The following morning 28 copies of the Job Book are reproduced and distributed among the twenty local job centers and the main job center.

Placement Operation - An individual seeking a job may enter the system at any one of the local centers or at the main center. More than 50% of the

STATE OF MARYLAND DES 877 (1 PART) 4/68

applicants, however, go to the main center. Upon entering the main center, an applicant is directed to an area where he fills out an initial form. He is then directed to proceed to one of nine stations manned by five interviewers and an interviewer/manager. Additional information concerning his skills and experience is added to the form by the interviewer.

Using the area of the Job Book which seems to contain the jobs most suited for him, the interviewer visually locates several jobs and discusses them with the applicant. After they have agreed on a single job, the interviewer telephones Job Control to ensure that the job has not been filled earlier in the day or that another applicant has been sent out. If neither event has occurred, the interviewer than telephones the employer to ensure that the job is still open. If the job is open, the applicant is given the necessary information to proceed directly for an interview.

When a referral is made, the interviewer fills out a card on the applicant (D.E.S. 508.3) which records basic statistics concerning the applicant. This card is then forwarded to the Automatic Data Processing Unit. The computer then sends a form (D.E.S. 508.2) to the employer requesting that he note the results of the interview with the applicant and return the form to the Job Center. If the form has not been returned within five days, then the Job Order Taking Unit calls the employer and secures the information by telephone. The final result is to match card D.E.S. 508.2 with D.E.S. 508.3 and store the data for future statistical reports.

Non Placement Applicants who are not placed in a single interview with an

employer may return for further referrals until they do secure a job. If job placement seems hopeless because of a lack of job skills, an applicant receives counseling in job training and skill improvement possibilities. In addition, applicants may not be able to secure jobs because there is currently no demand for their specialty. These applicants may eventually be placed when future job orders in their skill area are received by the Center.

Updating When a job order is first entered in the Job Book, the date of its entry is noted. In most cases if no referrals have been made for the job after 14 days, the Job Order Taking Unit calls the employer to determine if the job is still open. Professional and Technical jobs are checked only after 30 days as these types of jobs usually take longer to fill than lower level jobs. In addition, any changes in the requirements for the job (skill, experience, pay rate, etc.) will be updated. These changes are then sent to ADP and appear in the next day's Job Book.

Cooperating Agencies From the Job Bank point of view local social action agencies acting in an uncoordinated manner in seeking jobs for the unemployed were primarily responsible for engendering employer hostility. In order to correct this, many of these agencies have been invited to participate in the Job Bank. To date, 17 agencies, including the Baltimore Urban League, have done so. Each agency is accorded free access to the Job Book, desk space, telephone services and an employment service employee to assist them. The agency is free to refer any persons that they have secured through their own outreach to appropriate jobs contained in the Job Book.

The only stipulation on their activities is that they follow the administrative procedures earlier outlined so that they don't disrupt the system.

Future Developments Recognizing the limitations of a semi-automated system working only in Baltimore, the Job Bank has expansive plans for the near future.

1. Hopefully, by July 1970 and no later than December, 1970, the system will be fully automated so that all job matchings will be done by computer.

2. By no later than July, 1972 and perhaps as early as January of that year, this total system should be in operation on a statewide basis.

3. At a later point in the 1970's the Job Bank anticipates being part of a nationwide employment system.

Critique There are several shortcomings in the existing system, most of which are freely admitted by the Job Bank.

1. The system is more concerned with satisfying the employers than the currently unemployed. Inadequate job development is being provided to the hard core unemployed and inadequate use is being made of training opportunities.

2. The majority of jobs provided by the system are low paying and undesirable to most people. Nor is there any program to work with

social action groups in the City to actively seek to elicit from employers jobs with upward mobility.

3. The current DOT 6 digit coding method for both jobs and applicants tends to perpetuate unreal job classifications.

4. The current manual matching method falls far short of ensuring that the best available job for an applicant has been located since many possible jobs are not examined.

5. The Main Job Center is consistently overloaded with applicants while the 20 local centers are running at far less then their true capacity. Although five additional centers are planned in high unemployment neighborhoods, this will not appreciably relieve the Main Center's burden unless the unemployed are strongly encouraged to go to their local center rather than the Main Center.

Despite these and many other shortcomings, the Job Bank must be considered a success.

1. Prior to the implementation of the semi-automatic system, job referrals were running about 3,000 per month and are now at about 10,000 per month.

2. The current system uses only an IBM 1401 computer, so that start up costs were relatively low. Future systems will undoubtedly require much more sophisticated hardware.

3. Employer hostility toward the unemployed and concerned social

action groups has been reduced. Previously, many employers felt they were being harassed by constant telephone calls regarding employment opportunities, (a large company in the area reported that 97 such calls were received in one day).

4. Many changes in the system, desired by local groups, cannot be implemented by the Job Bank since the authority to do so lies at the topmost level of the state government. Lobbying at this level may be more effective in promoting improvements then confrontation at the local level.

Salt Lake City

The Automated Placement System started operations in January, 1969. The program originated in mid-1966 when Utah was chosen with several other states by the Department of Labor to demonstrate EDP applications for Employment Security Activities. By late summer of 1967 the conceptual design outlining the desired characteristics of the system had been completed. A detailed system design was completed by May, 1968 and by October, 1968, the necessary operational programs had been written so that system implementation started in December, 1968.

Originally, the system was tied into only two employment centers--Salt Lake, and Ogden. In June, 1969 four additional centers were added so that 93% of the state's population is directly serviced by a computer job matching capability. Smaller offices serving the remaining 7% of the population must use the system indirectly by telephoning an office tied into the system.

During the period January-August, 1969, the system handled over 32,000 job orders and conducted 35,000 searches to find jobs for applicants. Over 22,000 placements resulted. Currently about 3,000-3,500 jobs are in the system on a given day and about 130 jobs are added or subtracted on a daily basis. Approximately 200 applicants per day make use of the system.

Basic Characteristics The Automated Placement System is a fully automatic system operating in real time. This means that an applicant's qualifications and desires are immediately compared by computer with all the available jobs in his area of interest.

An applicant enters one of three job centers and fills out a single form (see attached form 511). The information on this form is then partially recopied onto a "terminal worksheet" (see attached form 539) which is then entered at a terminal tied into the computer. There are a total of 18 such terminals, 14 of which are in use on a given day. Each terminal has a visual display console which looks like a typewriter combined with a television set. The information concerning the applicant is entered into the computer by typing on the keys. Within seconds, the matching jobs appear on the screen complete with relevant information such as location, wages, etc. If the applicant is not satisfied with his choices, then a slightly different job category can be tried, yielding a different set of jobs. After selecting a job, the applicant then proceeds on his own for an interview with the employer.

If no job exists for the applicant, he may be referred to a job training program which is also stored in the system as if it were a job. If the applicant does not desire training, then he is placed in a general file which is matched against new job orders as they are entered into the system. Any applicants who have not been placed in a job after 15 days are referred to the management supervisor for counseling (see attached "No Service Notice").

Job Orders Jobs are telephoned into the centers by employers and recorded on an Employer Order Record (see attached form 514). They are then immediately compared with unemployed applicants on file. If there is no match, the job is stored in the system. When a job is filled, the employer is expected to notify the center by telephone and the job is removed from the system in the same manner. Jobs which have not been filled after 30 days are checked by telephone to ensure that they still exist.

Job training openings are recorded on the same form as if they were job openings. Information concerning the openings, however, is actively sought by the Bureau of Employment, rather than passively waiting for them to be called in.

Follow-up on Referrals Unlike the Baltimore system, Salt Lake does not send a card to the employer to determine the results of the applicant's interview. Instead, the job center interviewer is directly responsible for follow-up by telephoning the employer. If the interviewer has not notified the computer within 5 days as to the results of a referral, then the computer notes this failure on a printed list (see attached follow-up list). The interviewer is then expected to correct his error or explain why follow-up action was not taken.

Job Classification Jobs and applicants are classified on the basis of the DOT 9 digit code (including a three digit suffix) and 34 selectives. The nine digit code defines the job, the selectives specify any special requirements such as age, sex, physical strength, willingness to travel, etc. In a job match, however, the computer considers only the three selectives that the employer or applicant has designated as "musts."

In making a match, the computer first considers jobs using the full 9 digit code and the three pertinent selectives. If no match is made, it then drops to the first 6 digits. If there is still no match, then only the first 3 digits are used. In most cases, a match will have been made by this point. If necessary, however, the computer will continue to examine other digit combinations until it is certain that absolutely no jobs exist in the system which the applicant is in any way qualified for. In addition, if the applicant chooses, he may seek a job solely by selectives (see "Complex Search").

Complex Search When an applicant cannot or does not desire to seek for a job strictly defined by the DOT code, he may search for a job solely on the basis of selectives. This "complex search," however, cannot be done on a real time basis in the existing system. Instead, when required, a complex search is conducted at night. The applicant and employer are then informed the following morning.

Batch Component Since a real time system does not provide a permanent record of either jobs or applicants, each is keypunched nightly. Each job generally requires 8 cards in order to fully describe it, each applicant requires 11 cards. These cards provide the basis for statistical reports.

Hardware The Salt Lake City system makes extensive use of sophisticated hardware. The 14 terminals in constant use represent only a fraction of the total hardware.

At the Data Processing Center:

Spectra-70/45 Central Processing Unit of 256 K, Multiprogramming and and Multiprocessing.

Duplex processing system of same configuration for back-up.

Five 2311 type discs, one for system storage.

Two mechanical large storage data cells with 1 billion byte capacity. To be replaced by large discs soon.

Normal peripherals, tapes, printers, etc.

At employment offices:

A cathode-ray terminal (RCA).

A teletype terminal attached to the CRT. (cathode-ray terminal)

A medium speed printer attached to the CRT at some locations.

Communication via totally dedicated low speed lines with one wide band line for a high speed printer at the largest office.

From 8 a.m. to 5 p.m., one computer system is utilized exclusively for job matching during which the other computer is largely idle except for checkout of new programs. During the second shift, the batch-processing portion of the job matching system is run. Monthly batch runs are made for other activities of the Utah Employment Security Agency. Prior to the acquisition of the second computer, the hardware was utilized 70%-80% for job matching.

The data can be displayed either on the CRT or printer, or on both.

During nightly data base update runs, a job matching search is automatically performed. The interviewer is notified if a match is discovered. "Complex" searches can be requested for the second shift run.

A number of other factors are checked during update runs such as length of record inactivity, the number of times a record is rejected by the user, the number of unsuccessful referrals, etc. Each situation causes a notification to be sent to the local employment office or the applicant.

A complete transaction file is recorded on magnetic tape for statistical analysis. Weekly and monthly accounting records are kept as to the number of requests made by station and request type. All records are keypunched onto cards for permanent entry into the system. Immediate searches can be initiated on the CRT but no permanent record is created in that way.

Every week a partially descriptive listing of all available jobs is printed on multilith paper for distribution to local offices and other interested organizations such as college placement bureaus.

Software Features

Mini and master files are completely cross-indexed. Communication software is capable of using the full speed of the connecting line for quick video display. Many commercial time sharing systems process only one line at a time and 10 characters per second.

The entire system is coded in BAL, the RCA Spectra-70 machine language. This makes the system very machine-dependent and impossible to transfer to another type of computer. Future work will be done in COBOL, which will avoid this problem.

Data Base Design

Applicant records are stored on two files, a master file and a "mini" file. The master file contains the entire record of the individual with a list of the jobs for which he is eligible by DOT code. This record is retrieved for inspection before making a referral. It remains on the file in two modes, active and inactive.

The mini file contains only numeric data concerning the individual. The file is arranged low to high by DOT code and within DOT code by social security number. Each record contains the selective factors describing the individual and the address of his record on the master file. There is also a flag that is set when a referral or job offer is pending, and another if the interviewer should be contacted before a referral of the individual is made. The mini file is used for job matching.

Job records are stored only on the mini file, arranged low to high by DOT code and "job order number" as assigned by the interviewer. Each record

contains the selective factors describing the job and any prose information for special instructions.

System Design

The system consists of one basic matching operation, the capability to purge and update the data base, and accounting data retrieval. All job matching functions are variations of the basic operation--a file search. The applicant or job mini files are searched for a specified DOT occupation code or some subset thereof. When the DOT code is located, the records for that code are extracted from the file. All those individuals or jobs who do not satisfy the "must" selective factors (up to 3) are discarded. From the remaining, a number of records are chosen (the number specified by the user) which best satisfies the sought after selective features. Ties among applicants are broken by a set of preference routines: disabled veterans are first in preference, general veterans second, and those who have been on file the longest, third. This means that a disabled veteran in the system for only a few days would win in a tie for a job with any other veteran or non-veteran.

Response Time

According to the group head for the project, the longest response on the CRT is 40 seconds. This depends greatly on the number of user at any particular time.

Development Effort

Phase	Time	Manning Level	Total Man Months
Concept Design	2/67 - 10/67	4+ part time	16
System Design	11/67 - 4/68	1 full time 2 part time	12
Programming	5/68 - 12/68	6 full time	48
Total	2 Years		76

Conclusions Most of the criticisms leveled against the Baltimore system (lack of job development, overly strong reliance on the DOT classification of jobs, etc.) are applicable to Salt Lake City. There are aspects to the system, however, which make it superior to the Baltimore system in several respects.

1. Both jobs and applicants files are automated so that an applicant's qualifications can be matched with a far greater number of jobs.

2. The matching is done extremely rapidly.

3. The system is not greatly biased in favor of the employer.

4. The system allows an applicant to seek a job anywhere in the state.

5. Training programs are treated as jobs, thus giving the applicant an immediate option.

6. The applicant can search for a job solely on the basis of selectives.

7. Counseling of applicants who cannot be matched with jobs (after 15 days) is an integral part of the system.

The system, however, is not free of criticism.

1. Programming has been done in a little known machine language applicable only to RCA equipment.

2. The Employment Bureau has far more computer hardware than it actually needs for its operations.

3. Although the system is superior to that in Baltimore in many respects, it should be since much more time and money went into its development.

4. Unlike the Baltimore system, local private agencies do not seem to have direct access to the Salt Lake System.

Wisconsin The On-Line Placement System is expected to start operation during the latter half of 1969 in Madison. Eventually, the system will be expanded to cover the entire state. Even less information exists on the Wisconsin system than Salt Lake City, the two systems, however, seem very similar.

The Wisconsin system is on-line, using visual consoles, operating out of two job centers. As a result planned daily operations are very similar in both systems. The On-Line Placement System, however, uses a variation on standard DOT codes called the Worker Traits Arrangement. Generally, the WTA code first identifies whether the applicant is seeking full, temporary, or part-time work, the job center he has entered, and the page in the Dictionary of Occupational Titles where his job skill is defined. The coding system is thus meant to be flexible and rather general. In addition, considerable weight is given to selectives.

Each night the computer automatically is to search for jobs for applicants who have not obtained a job in 30 days. Similarly any job openings unfilled for 30 days are also matched against all available applicants. Other operations necessary for statistical reports are also performed at this time.

Another matching done periodically will match unemployable applicants with job training programs. This will be done on the basis of the applicant's selectives such as interests, aptitudes, physical condition, etc.

Conclusions At this point the Wisconsin system has probably not been in operation long enough to warrant further study. Establishing contact with the program by mail, however, may be beneficial.

M— Recruitment

Police recruiting with an up beat

Most cities today have a tough time recruiting police. Washington, D. C., which candidate Richard Nixon during the 1968 campaign labeled "the crime capital of the nation," has faced rougher sledding than most. The capital is now 70% black, its police force 70% white, and, as one city official mutters, "the image of the policeman isn't the greatest today."

Now, thanks to a businessman's committee organized last fall at Mayor Walter E. Washington's request, both the image and the recruiting have a sheen they lacked a year ago. The committee put together an advertising-public relations campaign that pulled in more than 800 new police officers and is still paying off thanks to a backlog of good applicants. A special point of pride: More than 40% of the backlog is black.

Just last week, Mayor Washington agreed in a White House meeting to try to find 1,800 policemen this year. He thinks he can meet this ambitious goal because of the goodwill generated by the business-sponsored advertising campaign. Meetings all week concentrated on how the campaign can be cranked up again, and how local businessmen can be involved.

New pitch. The recruiting campaign is being studied by Justice Dept. officials as a possible model for other cities with similar problems. It got its start early in 1969, after a year-long recruiting drive fell far short of its goal. District recruiters had spent 1968 scouring military bases along the East Coast for GIs—mostly white—about to leave the service. The pitch: "Sign up with us, and you get out of the Army 2, 3 months early."

Only 200 answered the call. But President Johnson had authorized an addition of 1,000 men to the force a year earlier. And the police department was faced with the fact that Congress would surely grant all or part of President Nixon's request for still another 1,000.

Last spring, Deputy Mayor Thomas W. Fletcher and top officials met with local public relations men to talk over the problem. The result was a five-week public relations-advertising campaign sparked by Fletcher (now city manager of San Jose, Calif.). It included a series of ads paid for by department stores and other businesses, and radio spots narrated by local actors, including Bob Terry, the city's leading black disc jockey.

The ads took an up-beat, positive approach that stressed the importance of the policemen to the city and its people. Sample from a radio spot:

"Hey, what's a *now* career?"

"That's a job with a beat."

"What kind of a beat?"

"A police beat. You walk it, you drive it, and it's always different."

"Why?"

"Because *everybody* needs you. When you're a policeman, you belong to the city and the city belongs to you."

"How much bread do you get for that?"

"Bread? Man, it's $8,000 a year for openers."

"Dig it."

Announcer: "Join the metropolitan police, the *now* career in a great tradition. Mobile recruiters are at Oklahoma and Benning Road, Northeast, and at Georgia Avenue and Farragut, Northwest."

Other spots dramatized a policeman delivering a baby or directing tourists to a place for a kosher sandwich, the statue of Samuel Gompers, or the Rochambeau Bridge. Newspaper ads featured police at work.

Black skepticism. At the outset, many blacks were skeptical. William Raspberry. Washington Post columnist, saw the campaign as one trying to capitalize "on the desire of many young blacks to have a hand in making things better. . . . It recognizes that the perception of the police force as an occupying army is more than militant rhetoric." He figured the campaign might not work out "but it certainly makes sense to try."

Posters paid for by businessmen attracted 800 Washington, D.C. police recruits.

One black commercial art company refused to bid on some of the art work; the owners didn't want to work for the police. Soul music stations and the black press did run ads, though, paid for by businessmen.

Still, blacks were actively involved in the campaign right from the beginning. Negro clergymen and Parent-Teacher Assn. presidents were asked to invite policemen to talk to young people's groups and to other policemen and persuade them to join the drive and bring their friends.

Businessmen's role. The campaign that helped make the project a success was put together by Ernest Wittenberg Associates. The businessman's committee, "Citizens for Police Recruitment," was formed to seek funds from businesses and to ask them to run ads.

Robert McElwaine, an ad agency official, was chairman of the committee. Letters went out from such business leaders as Donald S. Bittinger, president of Washington Gas Light Co. As Fletcher notes, this kind of campaign gave the businessmen something positive to do about police protection at a time when many were publicly and privately blasting city officials for failing to cope with sharply rising store and bank robberies, burglaries, holdups, and assaults.

Sponsors. Department stores ran newspaper ads and other businesses contributed to buy space. General Motors Corp. and Ford Motor Co., among others, substituted police recruiting spots for company radio commercials. One estimate is that at least $100,000 worth of time and space was contributed, but none of the sponsors signed its name to the ads. The campaign was stopped when the police had all the applicants they could handle. ■

PROBLEM ANALYSIS

The problem of private sector employment of the urban poor should be viewed as one of institutional relationships between three major forces--private enterprise, which provides the employment reception system (jobs), the ghetto community and the public sector (Federal, State and local agencies and programs), which combine to provide the employment delivery system. Past and current failures in solving urban unemployment and the manpower problems of business reflect deficiencies in past and current relationships between the three key forces. Business, while physically situated in the community, has tended to remain psychologically between the ghetto and the public agencies, but not necessarily of a rational or constructive character. Future progress must await the successful reordering of these basic relationships.

No viable solution is possible to the problem of urban unemployment and underemployment--or to a company's manpower problem--without the creation of a rational overall framework of balanced structures and without the allocation, within that framework, or appropriate roles and responsibilities between key components of the system. Once such a framework has been established and roles have been allocated, rational processes designed to effectuate the system's objectives can be developed. The key need is the design of a rational system, within which the manpower needs of business may be effectively meshed with the employment needs of the community, so as to effectuate a meaningful transfer of capability between the two urban worlds.

Central to the deficiencies, shortcomings, and frustration of past and present manpower programs has been the failure to effectively mesh job seekers with jobs in any really comprehensive and systematic fashion. Thus, in the absence of any meaningful definition of the job market or any truly effective coordination between business, the ghetto, and public agencies, job recruiting has tended to be conducted in a partial vacuum, to often oblivious to the real needs and opportunities existing in the private sector as well as to the special concerns of business, vis-a-vis prospective employees.

The central thesis of this approach is that both the ghetto community and business can play crucial roles in constructing a rational framework for urban employment, by establishing a truly comprehensive and coordinated system to match people with jobs, utilizing a modern information system which accurately defines and describes both the job market and the employment needs of this community, providing technical assistance to facilitate the flow of vital information, and developing a process of cooperative liaison and negotiation between themselves and the public sector. Within such a framework, business could design, develop, and implement a comprehensive reception system (jobs), as well as provide employment opportunities and employee up-grading programs. The multiple functions of the delivery system (including recruitment, screening, motivation, and orientation to employment) would be left primarily to the ghetto community and the public agencies, working cooperatively to provide qualified and trainable manpower for private enterprise. The Cincinnati Automated Job System is intended to be a system which responds to these considerations.

The Cincinnati Automated Job System

Goals

The Automated Job System is meant to serve the needs of unemployed and underemployed persons in Cincinnati by offering them opportunities in:

1. immediate employment
2. improved employment
3. training leading to employment

Basic Characteristics

The System differs from many employment efforts in several respects:

1. The System will actively seek jobs from employers rather than passively waiting for them to be telephoned in.
2. The System will actively seek unemployed and underemployed persons.
3. Once an applicant's characteristics have been determined, he will be rapidly matched with a job, providing a job exists in the System's files.
4. The resulting job will be the job that best matches the applicant's skills and interests.
5. When no job can be found, the applicant can be quickly matched with a training program.
6. An applicant may be immediately matched with a training program if he so desires.

The system should start operations in April, 1970. During the subsequent two months, the system will operate on a demonstration basis allowing time for modifications and improvements in the initial system. By June, 1970 the system should be fully operational.

The Cincinnati Job System can be described as a real time, on-line system. In effect, this means that data concerning jobs or applicants is directly entered into the system and a response is immediately forthcoming.

To do this will require a remote hard copy console located at the Job Center and tied into a computer at another installation by a telephone line. Data is entered into the system by typing on a standard keyboard. Responses from the computer will be automatically typed out. The system will thus provide a paper record of all entries into and responses from the computer.

The computer facilities will not be located at the Job Center but rather at some established installation capable of time-sharing. Establishing a strong working relationship with this independent installation will be crucial to the efficient operation of the system.

Fortran will serve as the basic computer language of the system. The use of this widely known computer language will ensure that the system is not constrained to running only on specific types of computers.

In order to operate the System, Urban League personnel will have to undergo a degree of technical training along the following lines:

1. routine procedures including operation of the console;
2. total system capabilities;
3. basic technical procedures.

Urban League personnel would at no time be expected to perform the tasks directly connected with the computer's operation.

System Outputs

Looking at the Automated Job System from the point of view of the applicant making use ot it, there are a definable number of possibilities regarding his final placement:

1. An applicant may be successfully matched with a non-OJT job which may be:
   a. Permanent
      1. full time
      2. part time
   b. Temporary
      1. full time
      2. part time
2. An applicant may be successfully matched with an OJT job. All OJT jobs should be permanent and full time due to the nature of the OJT Program.
3. An applicant may be successfully matched with a training program. He may require:
   a. Training only if he presently holds a job which will not interfere with his training or does not need a job during the training period.
   b. Training and a temporary job during the training period. The job may be:
      1. full time
      2. part time

4. Every attempt made to service an applicant, but, he may never be successfully matched with a job. He may reject all his possible placements, may be rejected by employers or training organizations, may have serious emotional or physical handicaps, may move from the area or just disappear, may be drafted into the armed forces, find employment on his own, and so on.

Although the above represent the possible outcomes for applicants entering the System, it should be emphasized that not all these possibilities are equally desirable. In practice, the System will be geared to developing full-time, permanent jobs with upward mobility. Realizing, however, that not all applicants may desire, or be remotely qualified for such jobs, the System will contain a complete range of job and training opportunities. The chart on the next page illustrates this situation. The percentages appearting in the boxes are hypothetical.

APPLICANT MATCH (100%)
OJT (20%)
NON-OJT JOB (40%)
TRAINING (9%)
NEVER SUCCESSFULLY MATCHED (31%)
PERMANENT NON-OJT JOB (24%)
TEMPORARY NON-OJT JOB (16%)
TRAINING ONLY (3%)
TRAINING AND TEMPORARY (6%)
PERMANENT, FULL TIME OJT JOB (20%)
PERMANENT FULL TIME NON-OJT JOB (21%)
PERMANENT, PART TIME NON-OJT JOB (3%)
TEMPORARY, FULL TIME NON-OJT JOB (14%)
TEMPORARY, PART TIME NON-OJT JOB (2%)
TRAINING ONLY (3%)
TRAINING AND TEMPORARY FULL TIME JOB (2%)
TRAINING AND TEMPORARY PART TIME JOB (4%)
NEVER SUCCESSFULLY MATCHED (31%)

Although the preceeding chart superficially resembles a flow chart it does not actually show the movement of applicants through the system. Rather it is simply a means of categorizing the types of employment and training possibilities and assigning hypothetical percentage of applicants who might fall in each category and subcategory. The same information can also be displayed in a different format. The chart below cross tabulates each major category with each minor category.

	Permanent Full Time	Permanent Part Time	Temporary Full Time	Temporary Part Time	Training Only	No Successful Match	Total
OJT	20%						20%
NON-OJT	21%	3%	14%	2%			40%
TRAINING			2%	4%	3%		9%
NO SUCCESSFUL MATCH						31%	31%
TOTAL	41%	3%	16%	6%	3%	31%	100%

Now concentrating solely on the types of jobs possible (that is, ignoring the possibilities of "training only" and "no successful match") we find that they may be broken down as follows:

	Permanent Full Time	Permanent Part Time	Temporary Full Time	Temporary Part Time	Total
OJT	30.30%				30.30%
NON-OJT	31.82%	4.55%	21.21%	3.03%	60.61%
TRAINING			3.03%	6.06%	9.09%
TOTAL	62.12%	4.55%	24.24%	9.09%	100.00%

Carrying this approach slightly further, it is then possible to examine this job breakdown in terms of the nature of the jobs. Jobs may be categorized into three broad areas; professional and technical, clerical and sales, and services and direct production. Hypothetically the total number of such jobs which were filled by the system over a period of time might be in the following proportions:

Professional and Technical	=	10%
Clerical and Sales	=	30%
Services and Direct Production	=	60%
Total	=	100%

Relating this information to the earlier determined minor categories of jobs: the following results:

	Permanent Full Time	Permanent Part Time	Temporary Full Time	Temporary Part Time	Total
PROFESSIONAL AND TECHNICAL	6.21%	.46%	2.42%	.91%	10.00%
CLERICAL AND SALES	18.64%	1.36%	7.27%	2.73%	30.00%
SERVICES AND DIRECT PRODUCTION	37.27%	2.73%	14.55%	5.45%	60.00%
TOTAL	62.12%	4.55%	24.24%	9.09%	100.00%

Similarly, the nature of the jobs can be related to the major categories of jobs:

	OJT	NON-OJT	TRAINING	TOTAL
PROFESSIONAL AND TECHNICAL	3.03%	6.06%	.91%	10.00%
CLERICAL AND SALES	9.09%	18.18%	2.73%	30.00%
SERVICES AND DIRECT PRODUCTION	18.18	36.37%	5.45%	60.00%
TOTAL	30.30%	60.61%	9.09%	100.00%

These three factors; major job category, minor job category, and nature of the job define the System's outputs. Although the percentages employed in this exercise have been hypothetical, by the end of the demonstration period actual figures will be obtainable.

Job Development

At the heart of the system is the precept that no attempt will be made to match applicants with jobs until a base of jobs already exists in the system. A target goal in this respect should be 200 jobs by March, 1970. This number should be constantly increased during the demonstration phase.

Initially, job commitments will be secured from as many firms as possible. Every attempt will be made to work in cooperation with organizations such as the Consortium under the Cincinnati Chamber of Commerce and the National Alliance of Businessmen. To place approximately 1200 persons a year, however, would require a level of at least 1900 jobs per year. Means of securing this level of jobs must be developed.

At this point there seem to be several job development methods which could be attempted:

1. Jobs will continue to be obtained under the auspices of the OJT Program through existing channels.

2. The Cincinnati Urban League could advertise the existence of the Automated Job System so that employers might telephone in job openings.

3. Jobs could also be sought in the five counties located in the Greater Cincinnati Area.

4. Certain local businesses within the target areas where unemployment is highest could be solicited for job openings.

5. Agencies which regularly receive job orders from employers could be encouraged to fill them through the Automated Job System.

Training Slots Job training openings are also a vital part of the system. In order to determine the dates and characteristics of these openings, the Urban League will regularly maintain a liaison with all training programs in the City. Due to the relatively small number of such programs, this should not be a difficult activity.

Computer Mapping for Job Development The complementary information system currently being implemented in the Cincinnati Urban League, and specifically its computer mapping component, may be extremely helpful in locating likely employers within or near to the target areas. This process can be effected through the use of the Dun and Bradstreet file of local businesses. The file, stored on magnetic tape and aggregated by zip code areas, could be used to produce the following kinds of computer maps:

1. The location of employers within specific areas of the City by the type of business.

2. The location of employers by the number of employees working at the firm.

3. The location of employers by annual sales volume or net worth.

These maps can then be compared with computer maps showing the location of unemployed persons so that priority areas can be specifically

designated on a geographical basis. The names, addresses, and telephone numbers of the firms within these areas can then be extracted from the total file on a printed list so that the individual responsible for job development can contact them directly.

The cost of obtaining the Dun and Bradstreet file is $165 per thousand businesses plus a basic charge of $75. The cost of securing data on businesses within and near to the four target areas should be less than $450. After six months, an updated version of the same file can be obtained for half this amount.

Job Storage Before a job can be stored in the system, it must first be identified and described using a general system. As a start, each job can be identified by the first three digits of the DOT 9 digit code. This general classification would work in the following manner.

In the DOT there are ten basic categories:

0,1	Professional, technical, and managerial
2	Clerical and sales
3	Service
4	Farming, fishery, forestry, etc.
5	Processing
6	Machine trades
7	Bench work
8	Structural work
9	Miscellaneous

Each category is broken down into ten divisions, e.g.:

02 Occupations in mathematics and physical sciences
51 Ore refining and foundry operations
86 Construction occupations

A three digit grouping represents a more specific breakdown of a division into ten subdivisions, e.g.:

050 Occupations in economics
242 Hotel clerks
311 Waiters
861 Brick, stone layers, masons

Each job would then be more specifically described in terms of special requirements and characteristics such as salary, working conditions, job location, and so on. (At this point), it seems feasible to use no more than fifty such characteristics to fully describe a job. (see form after page 3)

Out of these characteristics, the employer would be able to cite no more than three characteristics which are absolute "musts" for the job. For example, a job may require a driver's license, a car for travel, and work on weekends. These "musts" would be used during the matching process, and any applicant who does not fulfill them could not be matched with the job. When a possible match with an applicant occurs, the applicant would be shown all the requirements and characteristics of a job.

Originally, it was planned to use a different variation of a single basic form for recording each general type of job so that the job developer would ask the employer only relevant questions. Another proposed approach was to use branching so that a certain response to a question would prompt the interviewer to skip down the form to the next logical question.

While each of these appraoches has certain merits, neither seems to have a clear-cut superiority over a basic form which allows the job

developer and employer a latitude of discretion as to the characteristics which seem relevant to a job. The prototype form appearing at the end of this section is the result of these considerations.

Once recorded, jobs will be entered into the system at the console terminal. As each job is entered it will be assigned a four digit job order #. These numbers will be routinely assigned sequentially so that the very first job entered into the system will have a job order # of 0001.

During regular operations of the system, as a job is being entered an immediate attempt will be made to match it with an unemployed applicant in the system. Should this attempt be successful the applicant would be telephoned to come to the job center to review the job for which he has been matched.

If several applicants seem to be equally matched for a single job then the computer would choose one of them based on the following preferences:

1. Choose the applicant who has been in the system the longest;
2. If the tie is still not broken, choose the applicant who has dependents;
3. In the unlikely event that the tie is still not broken, choose the applicant who has been unemployed the longest.

The physical storage of jobs will be accomplished by storing them on computer discs, thus allowing a random access. Jobs would be placed on a particular portion of a disc by DOT code. Within a code group, jobs would be stored by job order #. The actual data contained on this disc will be only those items necessary to match the job with an applicant. The example form for a "service" job appearing on the next page illustrates this fact.

14	18	20

(AN EXPLANATION OF THIS EXAMPLE FORM APPEARS ON THE FOLLOWING PAGES)

Example Form The exact method for filling out a job order is described in Technical Report #4, Operators' Manual. The following is only an explanation of the entries appearing on the example form.

(1) Job Order (0176) -- This is the 176th job to be entered into the system.

(2) Obtain (2 T) -- staff member #2 received this job order by telephone at the center.

(3) Date (3/6) -- Received job order on March 6.

(4) Type (NOJT) -- This is a non-OJT job.

(5) Title (Parking Lot Attendant

(6) DOT (915) -- Job for parking lot

(7) Rel. Data (8) -- The job has no significant relationship to understanding data.

(8) Rel. People (7) -- The job involves directly serving people.

(9) Rel. Things (3) -- The job requires an ability to drive and operate equipment.

(10) Start (3/9) -- The job will be open on March 9.

(11) Ref. (2) -- Employer needs two attendants.

(12) Dur. (PP) -- Permanent part time, job.

(13) Union (No) -- Not a union job.

(14) Sex (M) -- Man desired

(15) Age (25-50) -- Should be within 25 to 50 years old.

(16) Education (R) -- Must be able to read and write.

(17) Experience (0) -- No experience necessary.

(18) Handicap (No) -- Employer will not hire seriously handicapped person.

(19) Bus (Yes) -- At least some employees ride bus to work.

(20) Lic. (R) -- The job requires a regular license for the operation of private vehicles.

(21) Car (No) -- The job does not require ownership of a car.

(22) Bond (No) -- Employee does not have to be bonded.

(23) Employee Sec. Clear. (No) -- Employee does not require security clearance.

(24) Empl. Ex. (No) -- No examination of skills performed by employer.

(25) Phys. Ex. (No) -- No physical examination required.

(26) Phys. Dem. (L6) -- Required to lift no more than 20 lbs. Must carry no more than 10 lbs. Must have visual acuity, depth perception, and an ability to distinguish colors.

(27) Work Cond. (023) -- Work is outdoors and requires an ability to withstand extremes of hot and cold weather.

(28) Type (N/A) -- Typing is not applicable to this job.

(29) Steno (N/A) -- Stenography is not applicable to this job.

(30) Work-days (5 M-F) -- Five workdays per week Monday through Friday.

(31) Shift (5S) -- Five hour split shift workday.

(32) Salary/Wages (2.00/H) -- Pay is $2.00 per hour.

(33) Period (W) -- Pay period is weekly.

(34) O/T. (Yes) -- Time and a half for overtime.

(35) Health (Yes) -- Employer has a health plan.

(36) Sick Leave (Yes) -- Employer allows sick leave.

(37) Vacation (Yes) -- Employer has a vacation plan.

(38) Loc. (4) -- The job is located in area #4 of the city.

(39-45) Self-explanatory

(46) Must Factors (14, 18, 20) applicant must be male, have no physical handicaps, and a driver's liscense.

Outreach for Applicants

In general applicants can be brought into the system in two ways:

1. Establish an employment center, encourage the unemployed to come to the center.
2. Secure referrals from other agencies.

These are not mutually exclusive options since a combination of both might be attempted. Before the system is in operation, however, relatively specific methods for outreach must be developed.

Once an unemployed person has been drawn into the system he and the type of job he desires must be specifically described. In general:

1. Each applicant will be identified by his social security number, address, and telephone number.
2. His desired job will initially be described by DOT code. An attempt will be made to do this using three digits. If this fails, only two digits will be used;
3. Training needs will be described by the first two digits of the DOT. If necessary only one digit will be used.
4. Each applicant and his job requirements will be described using a group of selectives. The selectives available to an applicant will depend on whether the desired job or training can be categorized as professional, technical; clerical sales; services, direct production. Each applicant will be allowed to designate three selectives as "musts."
5. These applicant characteristics will first be noted by an interviewer manually on a paper form. They will then be entered into the system at the console.

Applicant Storage The form used for storing information on applicants is similar in appearance to the job order form and reflects the same considerations of simplicity and flexibility. The sample form on the next page shows the questions asked by the interviewer and the applicant's responses. Subsequent pages more fully explain the entries. The detailed procedure for filling out this form appears in Technical Report #3, Operators' Manual.

(56) STREET: 286 WOODGROVE

(57) CITY: CINC. (58) ZIP: 45307

(59) TELE: 721-6831, 687-4862

(60) REMARKS: USE SECOND TELEPHONE # AFTER 12 NOON

(61) MUST FACTORS: 46 | 47 | 52

(AN EXPLANATION OF THIS EXAMPLE FORM APPEARS ON THE FOLLOWING PAGES)

Applicant Form

(1) I.D. (3) -- Interviewer's I.D. number.

(2) Date (2/23) -- Conducted interview on February 23.

(3) Social Security (073-34-2825) -- Applicant's social security number.

(4) Employed (Yes) -- Applicant is presently employed as a busboy.

(5) Time Unemployed (0) -- Since applicant is presently employed, his time unemployed is 0 weeks.

(6) Type (OJT) -- Applicant seeks OJT.

(7) Dur (PF) -- Applicant seeks permenent, full time position.

(8) Job Title (Automotive Mechanic) -- Applicant seeks job as an auto mechanic.

(9) Job DOT Code(620) -- Job for auto mechanic.

(10) Rel. Data (8) -- Job indicates no significant relationship to data.

(11) Rel. People (8) -- Job indicates no significant relationship to people.

(12) Rel. Things (1) -- Job indicates percision working.

(13) Exp (0) -- Applicant has no job experience as an auto mechanic.

(14) Job Start (2/23) -- Applicant is prepared to start a new job on Feb. 23.

(15-20) Since the applicant is seeking an OJT job, then the questions dealing with training are not relevant and they are left blank. If an OJT job in the field of automotive mechanics can not be found, then a search may be conducted for a training slot in automotive mechanics within a training program.

(21) Union (No) -- Applicant is not a union member.

(22) Sex (M) -- Applicant is male.

(23) Age (23) -- Applicant is 23 years old.

(24) Marital Status (M) -- Applicant is married.

(25) Depends. (3) -- Applicant has three dependents.

(26) Grade Compl. (11) -- Applicant has completed the eleventh grade.

(27) Voc. (No) -- Applicant has had no vocational training.

(28) Lic. (Yes) -- Applicant has a drivers license.

(29) Car (No) -- Applicant does not own a car.

(30) Draft (3-A) -- Applicant draft classification is 3-A.

(31) Vet. (No) -- Applicant is not a veteran of the armed forces.

(32) Disch. (NA) -- The nature of the applicants discharge from the armed forces is not applicable.

(33) Convict.(No) -- Applicant has never been convicted of a crime.

(34) Bond (Yes) -- Applicant has been bonded in the past.

(35) Sec. Clear. (No) -- Applicant has never received a security clearance.

(36) Height (6'1") -- Applicant is 6'1" tall.

(37) Weight (190) -- Applicant weighs 190 lbs.

(38) Handicap (No) -- Applicant has no handicaps.

(39) Phys (H7) -- Applicant is capable of heavy work in all categories of dexterity.

(40) Work Cond (I) -- Applicant wants to work inside

(41) Type (NA) -- Not applicable

(42) Steno (NA) -- Not applicable

(43) Verbal ( ) -- Space left blank because applicant is not talkative.

(44) Attitude (G) -- Applicant's attitude was good during interview.

(45) Appear (G) -- Applicant's appearance was good during interview.

(46) Workdays (5 M-F) -- Applicant seeks 5 day a week job, Monday - Friday.

(47) Shift (D) -- Applicant seeks a day-time job.

(48) Salary/Wages (3.00/H) -- Applicant seeks a wage of $3.00 per hour.

(49) Period (w) -- Applicant would like to be paid weekly.

(50) O/T (Yes) -- Applicant will accept overtime work.

(51) Health (Yes) -- Applicant would like a job offering health insurance.

(52) Vacation (Yes) -- Applicant would like a job offering vacation time off.

(53) Job Loc. (3,4,5) -- Applicant seeks job in areas 3,4 and 5 of the city.

(54) Appl. Loc. (3) -- Applicant presently lives in area 3 of the city.

(55-60) Self-explanatory

(61) Must Factors (44,45,50) -- Applicant must have a daytime job with 5 day work week, Monday-Friday with an annual vacaction.

Console Operations After the information on a job or an applicant has been manually recorded on its respective form, the data is entered at the console keyboard.

The keyboard operator signals the computer that either a job or an applicant is to be entered and that a match search is to take place. The computer responds by typing the number 1, indicating that the information pertaining to item 1 is to be typed. After doing this the operator presses the end of message key so that the computer may proceed to item 2. This process continues for every item on the form.

Within no more than fifteen seconds, should complete the attempt and automatically start printing the results. If no match is possible, the computer will simply print "no match" and the job order # or applicant social security #. If the match attempt is successful, then information will be printed out line by line. The printed data on a job or applicant will not appear in a code format but will be printed out in full. This will occur despite the fact that the data was originally entered in a code format.

The time required to print out a job order should be no more than 100 seconds. The information on an applicant, due to the larger number of data items, might require as much as 130 seconds.

Once the information has been typed by the computer the keyboard operator will tear off along the perforated line the section of paper containing the entire transaction and pass it on to the staff member who secured the job or interviewed the applicant.

Placement Actions Once the data has been returned from the console to the applicant interviewer or job developer who initiated the match search, several courses of action are possible. First, and most importantly, the initiating staff member has complete discretion as to whether the information should be passed on to the employer or applicant. He may act intuitively and disregard a match or may consult with his counterpart in job development or applicant interviewing for his opinion.

Assuming that the staff member concludes that a successful match has been obtained, both the employer and applicant must be notified. If the search was conducted while interviewing the applicant, then he immediately decides which job or jobs he is interested in. A job interview is then immediately arranged by telephone with the employer.

If the match is made in response to a job order, so that the matched applicant is not present, the staff member should telephone him to determine if he is still interested in a job and this job in particular. When an affirmative answer is obtained, the applicant is told to report to the job center as soon as possible for further instructions. The employer is then notified as to the possible placement and a job interview is arranged.

When the applicant arrives at the center:

1. The job is fully described to him and he is given a copy of the computer printed description of the job.

2. He is given a copy of the computer printed description of himself. This data will help him in filling out any forms that the employer requires.

3. He is given an AJS job Placement Card. This is to be given to the employer when he arrives for the interview. The employer subsequently notes the results of the interview and mails the card back to the AJS Center. (See example on next page.)
4. He is instructed as to how to travel to the interview from the AJS Center. He may also require instruction on how to travel to the job from his home.

At this point, the computer is notified that the applicant has been referred and that his file should not be matched until further notice. When the AJS Placement Card is returned by mail from the employer (should be returned within three work days) the computer is notified as to the results of the referral. If the computer has not been notified within five workdays, then it reports this fact. (See "No Action Notice" under Statistical Reports.

Counseling Counseling is an integral part of the system. Counseling applicants may occur at several phases during the matching process:

1. Some applicants may require counseling or other forms of remedial aid before any attempt is made to match them with a job.
2. Applicants who have been in the system for some length of time (perhaps 10 workdays) may require counseling or a redefinition of their desired jobs.
3. Applicants who have been referred to three jobs and have not been successfully placed may need counseling.

The level of counseling offered by AJS staff members will be ultimately determined by their knowledge and experience. Generally, counseling will probably have to be handled by other agencies in the city.

AJS JOB PLACEMENT CARD

Statistical Reports In general, the system will be capable of the following types of reports.

1. Activity Reports -- These reports could be produced on a weekly, monthly or yearly basis. They could report the level of job placement activities for the last complete time period as well as accumulate all activities since the system began operation. Such reports would contain the number of: jobs entered, applicants entered, searches conducted, referrals made, placements effected, and the current level of unfilled jobs and applicants in the system.

Example AJS Activity Report

Date: 6/12/70

	JOBS ENTERED	APPL. ENTERED	SEARCHES	REF.	PLACE	EXIST. JOBS	EXIST. APPL.
COMPLETED WEEK	28	41	69	19	13	287	208
TO DATE THIS MONTH	61	73	134	52	40	287	208
LAST COMPLETE MONTH	130	109	239	84	61	266	175
TOTAL TO DATE	782	703	1485	806	527		

2. Placements by Job Type and Category -- This report would describe placements which have been effected in terms of the type of job (OJT, NOJT, and Training) and the nature of the job (professional, technical, clerical, sales; and services, direct production). The example report shown below is cumulative to date and is printed weekly.

Example: Placements by Type Job and Category

Date: 6/12/70

	OJT	NOJT	TRAIN	TOTAL
Prof, Tech	16	32	5	53
Cler, Sales	48	96	14	158
Serv. Prod.	96	191	29	316
Total	160	319	48	527

Other variations of both of the above reports are also possible.

3. 5 Day Job Notice -- On a daily basis, jobs which have been in the system for 5 days with no referrals will be printed out. A staff member will then telephone each to ensure that the job is still open and that there are no changes. OJT jobs, because of their contractual nature, will not be included in this report.

Example: 5 Day Job Notice

Job Order # 0468
Entered: 5/27
Title: Sales Clerk
DOT Code: 290
Company: Hamilton Drugs
Address: 64 Main St. 45310
Contact: Mr. Adams

4. Three Unsuccessful Referrals -- Applicants who have been referred to jobs three times without success are reported on a weekly basis.

Example: 3 Referrals

Soc. Sec. #: 047 - 28 - 3748
Title: Cook
DOT Code: 313
Name: Joe Doakes
Address: 72 Woodgrove St., 45681
Tele: 681-7346

If he desires, the staff member responsible for following up on this report could ask for and receive the applicant's complete file as well as the data concerning the jobs he was referred to.

5. No Match After 10 Days -- The names, addresses, etc. of applicants who have been on file for 10 days with no referrals are reported on a daily basis in the same format as above.

6. No Action Notice -- If the results of a job referral are not entered into the system within 5 workdays of the referral date, the computer will notify the staff member who interviewed the applicant so that he may determine the results of the job interview.

Example: No Action Notice

Interviewer I.D. #: 3
Applicant: 026 - 78 - 4217
Name: Sam Jones
Title: Truckdriver
Referred: 3/20/70
Company: Ace Warehouse
Address: 57 Whipple St. 45617
Tele: 671-3421
Contact: Melvin Stantz

Total System Process The following summarizes the general operations of the Automated Job System. For the purposes of simplicity, the progress of jobs and applicants through the system are treated separately.

Job Flow

1. A job opening is located by the job developer or telephoned into the Center.
2. The job order is manually recorded.
3. The job order is entered into the computer at the console,
4. The computer attempts to match the job with the available file of applicants.
5. If a match is obtained, an applicant referral is made.
6. If no match is made, the job is stored.
7. If no placement is effected subsequent to referral, the job goes into storage.
8. If a placement is successful, the job leaves the system. Follow up is conducted to the extent that the results indicated on the Job Placement Card are used for output reports.
9. A job in storage may be matched at a later date with an applicant in which case steps 5-8 are possible.
10. After 5 days without a match, a job is reported out for updating.
11. If the job no longer exists, it is removed from the system. If it is still open, it is retained in storage. If there are any changes in the requirements for the job, these changes are entered on the console keyboard.

The flow chart on the next page illustrates this process.

OUTPUT REPORTS
OUT OF SYSTEM
OUT OF SYSTEM

Applicant Flow

1. An applicant is located through outreach.
2. The applicant is interviewed.
3. The interviewer determines if counseling is necessary.
4. If counseling is required, the applicant is referred to the appropriate agency. Some applicants will probably leave the system at this point. Others will return to the Center for a matching attempt.
5. Applicants judged suitable for a match attempt are entered at the keyboard.
6. If a job is found, the applicant is referred for a job interview.
7. Applicants who are not matched are placed in storage.
8. If a referred applicant is not placed, then he goes into storage.
9. Applicants who are placed leave the system. Follow up in the form of the AJS Job Placement Card is used for output reports. Follow-up on a specific applicant to determine how he performs once placed in a job and whether he needs additional aid is not a computerized function. The extent of such follow-up and its duration will be decided on an individual basis.
10. Applicants in storage may be subsequently matched with jobs in which case steps 6-9 are possible.
11. Applicants who have failed to be placed after three referrals or have not been matched after 10 days are reported out.
12. Applicants described in step 11 are contacted and may be asked to come to the Center.
13. If counseling is required, then steps 4-5 are possible.
14. Some of these applicants under step 11 may have obtained jobs through other means, may no longer be interested in a job, or may be lost to the system for other reasons.

The flow chart on the next page graphically outlines the above process.

Penchant of Americans For Job-Hopping Vexes Companies Increasingly

Rising Unemployment Curbs Turnover Now, but the U.S. 'Quit Rate' Continues Up

What Makes Charlie Run?

By RALPH E. WINTER
Staff Reporter of THE WALL STREET JOURNAL

"I must get satisfaction from my work if it's going to be worthwhile for an employer to have me around," says Tom.

Tom has proved hard to please. Since getting out of the Marines 10 months ago he has had six jobs. He has been a potato chip salesman, an insurance office clerk, a taxicab driver, an iron worker on a construction job, a white collar worker in a steel plant and a youth counselor for a religious group.

"I sort of liked construction work, because I was risking my life every day, which was challenging," says Tom, who prefers to remain anonymous. But he quit that job to take a vacation and hasn't found anything since that he likes as well.

Tom is an exceptionally mobile job-hopper, but his case illustrates a long-term trend that is paining employers across the nation. Americans have been taking advantage of prolonged prosperity and labor shortages to move from job to job, continually seeking a position they like better or one that pays more or one in a more desirable area.

A Temporary Reversal

The recent rise in the unemployment rate—it reached 4.2% in February, up from 3.9% in January—has curbed job-hopping a bit, to the relief of some employers, but labor analysts say the trend can be expected to surge again as soon as the job market opens up. The "quit rate" in manufacturing, the Government's best index of job-changing, averaged 2.7% of the factory work force per month for all of 1969, compared with 2.5% in 1968. The 1969 figure is up 80% from the 1.5% monthly average of 1964.

"The grass has always appeared greener on the other side of the fence," says George H. Hunter Jr., vice president of industrial relations at Whittaker Corp., a highly diversified Los Angeles company. "But people nowadays are less afraid to jump over and try it, because they're looking for opportunity, not security."

The problem isn't confined to workers in manufacturing. John Hancock Mutual Life Insurance Co. says turnover among the 6,000 employes at its home office in Boston was 35.5% last year. The rate in 1964 was 20.7%. The far-flung Bell System had a quit rate of 21% in 1969, half again as high as the rate five years earlier.

Professionals and executives are restless, too. The American Management Association and the National Industrial Conference Board say management turnover statistics are hard to come by, but personnel men assert that many trade conferences turn out to be primarily recruiting gatherings.

Can't Be Choosy

The relative tightness of the labor market during the prosperity of recent years has forced employers to lower standards for hiring. This contributes to instability. "We're hiring people we wouldn't ordinarily let in the door," says Frank Gleason Jr., chairman of Copeland Refrigerator Corp. in Sidney, Ohio. "As a result, the turnover is so bad that we don't give physical examinations until the end of the third week of employment. By that time eight out of 10 have quit anyway."

Another factor has been Government pressure on companies to hire and train the hard-core unemployed. These workers aren't used to the discipline of going to work regularly, and the turnover among them is great. For instance, Armco Steel Corp. last year took 80 men into a program for the hard-core unemployed in Kansas City. Forty men finished the six-month training program. (Of those, however, 36 still are employed by the company.)

Turnover tends to be higher among younger workers. And unskilled workers have a higher turnover rate than skilled workers. The latter trend is reflected in employment statistics of foundries, which hire many unskilled laborers. A total of 141 foundries responding to a survey of the National Foundry Association reported that during 1968 they hired 18,500 persons, equal to 59% of their 31,000-man work force. As of April 1969, only 4,800, or 26% of those workers still were on the payroll.

Many specialized jobs, including some on higher levels, have become interchangeable from company to company. A computer programmer, for instance, can handle insurance policies, paint inventories or steel payrolls without shifting gears.

PR Is Fluid

Public relations is another field where work is largely interchangeable and job-hopping is prevalent. When Cleveland-Cliffs Iron Co. recently sought a public relations director, it got 89 resumes. The man finally selected, Anthony J. Torticini, is only 27, but the Cleveland-Cliffs job is his fifth.

The growing number of working wives—16,361,000 wives exclusive of farming, were in the labor force as of last month—builds turnover, too. Employers say many women work temporarily to meet a temporary financial crisis in the family, or to buy a luxury item like a color television set, then quit. Others leave their jobs when they become pregnant.

The urge to change jobs is giving employers fits. For one thing, it's expensive to recruit new workers. R. G. Barry Corp., a Columbus, Ohio, maker of slippers, says it costs an average of $273 to fill the least skilled positions, such as materials handler, and $1,712 to fill positions requiring some skills, such as maintenance mechanic.

On the executive level the cost soars. The cost of replacing a sales executive or division manager can be $25,000 or more, personnel men say.

High turnover hurts efficiency. "You can't maintain regular production when you have 25 new faces every Monday morning," says a spokesman at Midland-Ross Corp., which had to hire more than 2,500 men to keep a 1,000-man work force during a 20-month period at its

Please Turn to Page 24, Column 4

The Roving Kind: Job-Hopping Penchai Vexes Many Compani

Continued From First Page

Maumee, Ohio, auto frame plant. The comp figures the resultant inefficiency cost it n than $6 million.

At the Mt. Vernon, Ind., plant of Babcoc Wilcox Co.,the turnover last year was al 65%. The company maintains that this cau it to fall so far behind on building pressure sels for nuclear power plants that custom pulled out 14 of the 36 on order and sent the ders to other contractors. Babcock & Wil particularly mourns the loss of welders. costs more than $5,000 to train such a m company officials say.

Employers use a broad range of tactics reduce turnover, but most report only moc ate success. One Milwaukee company has "buddy system" that pairs a new worker w a more senior employe to ease the newcor through the critical first few weeks. Hous Lighting & Power Co. adjusts working ho for working wives to suit their convenience

Companies try to improve communicati with their workers. Many interview work who are quitting to find out their problems. I this has limited success. "We get 'good' r sons, not the real reasons," frets one exe tive.

Companies say hanging on to the peo they want isn't easy. "It's an extremely co plex problem," says a Bell System person man. This is because there are many r sons for leaving. Many companies, howev have discovered that "the little things" oft are the reason for a departure. The irritatio range from the location of the parking lot the use of a time clock to a personality cc flict with a supervisor.

We Want Him

Employers acknowledge that they contr ute to turnover by eagerly pirating worke they want from other companies. Gone is t day when a man with several job changes his resume was considered suspect. Executiv now accept the principle of moving around get ahead.

Review the track record of C. E. (Charli Stump, a middle management data-processi executive. Mustered out of the Air Force 1964 with several years of computer expe ence,he signed on as a computer operator wi Mutual of Omaha Insurance Co. at $375 month. Seventeen months later he was maki $406, not enough for an ambitious young m with four children. And Charlie wanted to g into programing.

He took a vacation in March of 1966 to jc hunt and hired on with Glidden Co., Clevelan now part of SCM Corp., as a programmer an analyst at $610 a month. "I really liked Gli den," Charlie says, "but I became dise chanted because handling their payroll showe me people with college degrees were makin more than I was even though they didn't seer to be making as great a contribution."

Statistical Tabulating Corp., a compute service company that Charlie had been moor lighting for, offered a full-time job. "I arbitra ily threw out the figure of $10,000 a year," h says. Impressed with the work he had done fo them, they agreed. Within four months he wa a program manger earning $10,500 but workin 90 to 130 hours a week. That left no time at a for his hobby, picking a banjo in a bluegras band.

Then Medical Mutual of Cleveland, a healt insurance firm establishing its own compute center, offered him a job as manager of sys tems and programing at $12,000 a year. H decided to jump again. That job lasted tw years and might have been a career excep that top management "wasn't really comput er-oriented," he decided.

By that time, Charlie figured he was ready for general manager of a computer department anyway, so last July he gave six weeks notice and went job hunting. "That wasn't very good timing because everyone was on vacation," he says. But eventually he landed a job as administrator of the Cleveland branch of Computer Service Centers Inc. at "a substantial increase in salary." He has since been told his prospects are bright to become president of a service bureau within the corporation.

Relocation-Integration Project in Minnesota Is Reported Successful

* * *

Fifty Families, Mostly Negro, Moved to All-White Town After Armour Plant Closing

CHICAGO — (UPI) — Fifty packinghouse workers and their families—most of them Negroes—were relocated without incident in a small Minnesota town despite growing racial tension in some parts of the nation and a local housing shortage, it was reported.

The workers' families were relocated in previously all-white Worthington, Minn., a town of 8,000 about 60 miles east of Sioux Falls, S.D. The 50 families were moved to Worthington during the summer of 1965 following closedown of an Armour & Co. plant at Kansas City, Kan.

George P. Shultz, dean of the University of Chicago's Graduate School of Business and cochairman of the Armour-union Automation Fund Committee, released a report on a program for helping 1,900 workers displaced by the Kansas City shutdown. The report was prepared by University of Wisconsin economist James L. Stern.

The committee prepared the way for introduction of Worthington's first Negroes, the report said, by meeting with business, civic and political leaders and real estate interests long before the families moved.

The town's newspaper, the Worthington Globe, "helped immeasurably" with sympathetic reports on committee activities, and by organizing meetings to prepare the townspeople for the 35 Negro families and three families of Latin American ancestry, the report said.

"Integration of this number of minority group members into a town of 10,000 isn't a problem of the same magnitude faced by urban centers today, yet the accomplishment shouldn't be underrated," Mr. Stern said.

Of the 1,900 workers who were displaced in Kansas City, 801 found jobs with other employers there, 101 were hired by another Armour plant there, 183 were transferred to Armour plants elsewhere and 220 were placed on pensions, he said.

Of the remainder, some were in retraining programs, some have withdrawn from the labor force, some have left the area and the status of about 10% is unknown, Mr. Stern said.

The Automation Fund Committee is a joint labor-management agency established in 1959 under agreement between Armour and two AFL-CIO unions, the Amalgamated Meat Cutters and Butcher Workmen of North America and the United Packinghouse, Food and Allied Workers.

Manpower – Relocation

Relocation Allowances Help Jobless Workers

[10-19-68]

[from AFL-CIO News]

Experimental relocation of jobless workers to areas where they are able to find and keep jobs has proven successful, according to the U.S. Dept. of Labor.

A review of 18 relocation projects for 3,141 disadvantaged workers shows that 88 percent of the relocations were successful. The average individual allowance cost for the participants in these projects was $325.

The projects covered the 12-month period ending June 30. Compared to the previous two years, there was marked improvement in the percentage of successful relocations, coupled with substantial reduction in average individual allowance costs.

During 1965, there were 705 relocations with a 70 percent success rate. In 1966 and 1967, there were 2,488 relocations and the success rate climbed to 82 percent. The average individual allowance costs for those years was $442.

A higher success rate also was achieved in 1968, in spite of the fact that the workers involved were those with lower educational and skill levels, the Department said. They also had poorer employment records and a much higher percentage of them were collecting welfare or unemployment insurance benefits.

The success of the experimental relocation programs was also demonstrated by higher wages and improved occupational categories.

Although all participants were unemployed when they entered the program, the average wage they earned on their last regular job has been $1.80 an hour. The average wage on their new job rose to $2.25 an hour. Also, most of the individuals moved from unskilled and entry level jobs into semiskilled, skilled and managerial jobs.

Major Unemployment Factor

Labor Dept. Focusing On Drinking Problem

Washington (AP) — The Labor Department says it is putting new emphasis on alcoholism as a major cause of ghetto unemployment.

"Alcoholism is a factor to be faced in placing participants in national manpower training and development programs which aim at full employment in an expanding economy," the department's Manpower Administration said in a statement.

"A good job is also a factor in helping such persons to battle their problem."

The statement said increasing attention will be focused on the problem in surveys into causes and cures for high rates of unemployment in big city ghettos.

"A typical study, made in Milwaukee by case workers and counselors, revealed that among people in the slums who were not working, 15 percent were alcoholics or heavy drinkers, affecting their employability," the report said.

"In St. Paul, Minn., an alcoholism counselor was added to the public employment staff to work especially with alcoholics.

"In six months, 225 alcoholics were placed in jobs, and 75 percent of them are still at work and making good."

There are an estimated six million aicoholies in the United States — roughly three percent of the population — who cost the economy $4 billion a year.

The nationwide system of federal-state employment offices already offers special help to alcoholics, who are officiall designated as handicapped persons in job applications, th statement said.

A job applicant must designate himself as an alcoholic, or present a medical report with a doctor's diagnosis to be so designated.

"The department strengthened these efforts by drafting a comprehensive guide for counselor and interviewers dealing wi h alcoholics in the more than 20 0 local public employment offices," the report said.

Negroes Are Urged To Stay in Delta

Mound Bayou, Miss. (UPI)—The poor Negroes of the Mississippi Delta are being urged to turn to the rich earth of their own delta to help keep their children from flocking to the North's urban ghettos.

Dr. H. Jack Geiger, head of the Tufts University Delta Community Health Center and a prime mover in the stay-where-you-are campaign, said a survey of the area's high school graduates this year showed that 80 percent were out of the state by September.

"The day after graduation all you see are the people and their kids, with suitcases, standing along the highway waiting for the next bus," Geiger said.

Geiger, who is white, and his fellow officials at the center, John Hatch, a Negro social worker, and sanitation engineer Andy James, also a Negro, deplore the end result of this migration.

Geiger said the movement must be reversed because "the big cities tend to crush those over 30 and make the young wild.

"Here a man may be a deacon in his church," he said. "In the city he may be materially better off, but he loses that sense of belonging, his sense of dignity and of identity."

He is using a small number of high school students in laboratory work at the center, attempting to spur an interest in higher education. James also employs younger men in his work for the same purpose.

But more importantly the Tufts' team members were the leaders in formation of a cooperative farm, a 120-acre project that grew enough greens, beans, potatoes and cantaloupes to feed the 12,000 hungry people who live in northern Boliver County.

Ultimately, the men hope that a cannery they want to operate in conjunction with the farm will provide food needed and make the project self-sufficient.

New-Type Farmer Bows at Bureau Session

By Spencer Rich
Washington Post Staff Writer

KANSAS CITY, Mo.—Occasionally, at the American Farm Bureau Federation's 50th annual meeting here this week, you saw a man whose ill-fitting clothes looked like they came from a mail-order house. And, some of the wives, especially the older ones, were dowdy and a trifle hefty.

But by the looks of most of the delegates, the cornball ear in American agriculture appeared over. The men wore well-cut suits of good-quality cloth. The wives were often fashionably dressed, and a few of the younger ones were in miniskirts. One or two wore the same silly, elegant hairdos you see at Washington cocktail parties. Many of the delegates have college degrees, and they speak with fluency, though with rural twangs.

No doubt the kind of people who attend national farm conventions at roomy, comfortable hotels like the Muehlebach here are more prosperous and better informed than many of their neighbors.

Reflects New Type

But conversations with farm-related trades and professions at this convention left the impression that the new style in clothing reflects a new style in farmers.

Those here, at least, were not dirt-farmer or sod-buster types, although the Agriculture Department tells us that more than half the Nation's 3.1 million farmers can't really make a living.

For the most part, those interviewed were well-informed, skillful businessmen who knew an astonishing lot about modern technology and Federal laws and programs affecting their crops and livestock.

They were men who handle a great deal of money each year, use a great deal of money each year, use a great deal of machinery, make thousands of decisions requiring considerable knowledge and judgment, and manage properties that in value would be counted a fortune by an urban executive with a higher net income.

One farmer from a plains state, for example, a youthful, well-dressed, crew-cut man who modestly described his operation as "not so big," said he and his brother farmed 1500 acres worth about $250 an acre, or $375,000. They have $80,000 worth of machinery. They raise wheat, corn, beans and cattle, with annual gross sales of $200,000—which puts them up very high compared with the vast majority of farms. They charge a lot of expenses to the business, take a salary of $700 a month and end up with a net of $12,000 each.

Share Outlook

This farmer and others with sales ranging down to only a tenth as great all seemed to share the same outlook: A fierce sense of being an independent, self-reliant businessman; a man who "makes decisions" and "runs things," and a taxpaying, responsible person in the community, who thinks he can do better in agriculture if Government aid is phased out and who says he is anxious to try.

Another thing they seemed to share was a conservative outlook. For example, the policy resolutions adopted by the convention came out against communism, in favor of free enterprise, a smaller central Government, a balanced budget. The resolutions favored overturning the one-man one-vote requirement for State legislatures. They deplored leniency in welfare matters and they did not mention civil rights at all.

And, in one program statement that was warmly supported by everyone interviewed, they called for summary expulsion and dismissal of students and faculty members involved in campus disorders, if necessary putting them "under peace bond not to return."

Why the conservatism? One suggested answer is that despite their increasing modernism in dress, education and business techniques, today's farmers still retain a strong measure of the old rural ethics of an earlier day, reinforced by their pride, as businessmen, in standing on their own feet.

(cont'd on p. 6)

NEW TYPE FARMER
(continued)

Don't Like Aid

Though they may take it, farmers don't really like Government aid. They feel revulsion at being classified, in the public mind, as panhandlers feeding at the public trough, along with "welfare bums who are not doing any work, "as one man put it.

Then, too, they aren't familiar in the flesh with day-to-day urban problems. Discussing the Farm Bureau's failure to include in its resolutions any civil rights provisions, one staffer said that most of the Midwestern farmers who make up one of the two great blocs in the Farm Bureau (the other is Southerners) "have never confronted a Negro in their lives, so they listen to the Southerners' view on civil rights" when they come to the convention to draft resolutions. "They just have no experience on this," he said.

The views of Farm Bureau members are not typical of all farmers, though the Bureau is the biggest of farm groups with 1.796 million "farm families" claimed as members. More liberal onees join the National Farmers Union and other organizations. (The farm population as a whole is only 6 per cent of the national population.)

There was a lot of hoopla at the convention about farm worker unions and strikes, stimulated by the national consumer grape boycott in support of efforts by Cesar Chavez to organize California grape pickers.

Deeply Fear Strikes

Farmers — particularly in states like California and Michigan that grow a lot of fruits and vegetables—deeply fear strikes because a work stoppage of only a few weeks at a crucial time like harvest can destroy a whole crop of perishables.

The Farm Bureau's traditional posture has been against Government recognition of farm worker unions. But this year, at California's request, the Farm Bureau proposed a fallback position in case the issue should get hot in Congress: The Farm Bureau might be willing to have Federal law recognize open-shop unions, with the law enforced by the courts rather than Federal agencies. But as a quid-pro-quo, the Congress should include a flat ban on all secondary and product boycotts and strikes that endanger perishable commodities.

The most important issue at the convention was basic farm policy.

For years, the Farm Bureau has been preaching the gospel that agriculture must do away with the current system of Government price supports and production controls on grains and some other crops, and let the supply-and-demand mechanism of the market place take over.

Demand Repeated

The same demand was repeated at this year's convention. "We could do it in five years for the grains," said one official estimating the time needed for the transition, adding that it would reduce the $6-billion Federal farm budget by at least $2 billion a year.

Opponents of this view, like the National Farmers Union and successive Democratic administrations, have always argued that without the Government programs, enormous crop surpluses would build up, driving market prices sharply down and throwing many medium and small farmers out of agriculture and into urban unemployment lines.

The Bureau's counter-argument is that the existing system of controls and supports locks thousands of inefficient, marginal producers into the production cycle and helps to create the very surplus threat that the system is seeking to avoid.

With long-term programs of paying farmers to retire some whole farms from production, the Bureau believes, surpluses could be held down while controls were taken off the remaining farms. Persons who aren't really making a living out of farming could be trained for other jobs. And the efficient, low-cost producer would survive and prosper.

Expect Nixon to Act

Farm Bureau delegates assembled here this week like a congress of victors. Nixon, as the new president, more sympathetic to their views, would, they said, do what no other had: wipe out the hated system of controls, constraints and what they regarded as price-fixing.

But some dissensions in the Bureau's own ranks pointed toward the soft underbelly of its hopes and prospects. A big bloc of the Bureau's members are Midwestern grain farmers, but another big group are southerners. Perhaps more heavily than any other region, the South depends on Government aid programs for its premier crops—cotton, tobacco and peanuts. Many Southern farmers—big and small, rich and poor— simply don't think they could do as well in a market economy.

Even here, in the stronghold of free enterprise, the Georgia delegation recommended against eliminating the Government programs and there was strong minority sentiment along the same lines in the delegations from Alabama and some other Southern states.

NEW YORK TIMES DEC 1968

Organization Is Set Up to Help Local Groups Applying for Aid

By JOHN KIFNER

The Ford Foundation announced yesterday a $3.5-million grant to be used mostly to help local community groups get money from government and private agencies.

The Ford grant was to a new organization that is to be called the Center for Community Change. The center will also work to focus national attention on issues related to poverty and will press for government programs and practices responsive to the needs of the poor.

The nonprofit center was formed by the merger of three existing private organizations in the antipoverty field: the Citizens Crusade Against Poverty, the Citizens Advocate Center, and the Social Development Corporation.

Much of the organization's work, Ford officials said, will be devoted to assisting local community-based groups in developing specific programs and to aiding them in writing proposals for funds from government and private agencies.

Self-help groups of urban and rural poor people frequently are not aware of what funds might be available for their projects or lack the expertise to write a proposal that would be attractive to those passing on applications for grants.

"American society has begun to form new patterns of social and economic change at the community level," said McGeorge Bundy, president of the Ford Foundation, in announcing the center's formation. "We are slowly learning that grave problems like unemployment and underemployment, civic decay and despair, and miseducation demand both massive mined community competence, public resources and deter-

"We believe that the Center for Community Change is a powerful new instrument for helping community groups to gain the skills they need to deal productively with public and private funding sources and to take effective action in such fields as housing, business, employment, education and health," he continued, adding:

The president of the new organization is Jack T. Conway, former executive director of the Industrial Union Department of the American Federation of Labor and Congress of Industrial Organizations and former deputy director of the Office of Economic Opportunity.

Members of the center's board of directors include Julian Bond, a Negro member of the Georgia Legislature; Frank Mankiewicz, former press secretary to Senator Robert F. Kennedy; Burke Marshall, former Assistant Attorney General for Civil Rights; Martin Meyerson, president of the State University of New York at Buffalo, Walter Reuther, president of the United Auto Workers, and Paul Ylvisaker, Commissioner of the New Jersey Department of Community Affairs.

The Citizens Crusade Against Poverty was founded in 1965 with a $1-million grant from the United Auto Workers as a private counterpart to, and a watchdog over, the Government's antipoverty program. It has trained community workers, successfully lobbied against the cutting off of funds to a politically controversial Mississippi Headstart program, and sponsored a study of hunger and malnutrition.

HEW Rules Out Burson's Job Plan

By ACHSAH NESMITH

State Welfare director William H. Burson is withdrawing his proposal to establish job programs to employ welfare mothers and dropouts because of a threatened cut-off of federal welfare funds.

Miss Mary Switzer, administrator of the Social and Rehabilitation Service of the U.S. Department of Health, Education and Welfare, wrote Burson that "Georgia will no longer have an AFDC (Aid to Families of Dependent Children plan, which can be approved for continued federal financial participation" if he goes through with his proposal, Burson said.

Burson had planned to have his department contract with schools, and hospitals and other public non-profit institutions to employ welfare mothers and their teen-age children not in school as teacher, nurse, dietician, recreation, child care and social work aides. The child care aids, particularly, would help make it possible to provide enough day care centers to allow other mothers now receiving welfare to work.

He announced July 3 that he would conduct the program in counties not designated as "target counties" by the U.S. Secretary of Labor for its work incentive program, and pattern the Georgia program after that program, which is scheduled to begin next July 1 in not over 15 Georgia counties.

Burson said Miss Switzer took the position that only the Secretary of Labor could establish and conduct such programs and that his proposal was "inconsistent with . . . congressional intent."

He added that her decision "to cut off federal funds for welfare payments to dependent children if we implement my plan to place the able-bodied welfare recipients in meaningful and dignified employment leaves me with no alternative but to withdraw the proposal.

"We dispute Miss Switzer's contention that Congress did not intend for state welfare departments to operate job programs where state labor departments do not or cannot operate them," he said, but added that he could not afford to jeopardize the $38,832,700 in federal funds for dependent children this year.

"As important as is the point we wish to make through establishing employment for welfare adults, it is more important that we assure the provision of the necessities of life for children who cannot help themselves," he said.

He said the purpose of his proposal was "to serve the social-economic best interest of the State of Georgia by making it possible for all its 159 counties needing and desiring work incentive type programs to have them," adding that it would "make our welfare dollars do double duty."

LOS ANGELES HERALD - EXAMINER
LOS ANGELES, CALIFORNIA
OCTOBER 1, 1968

Saugus Center Pact OKd

Los Angeles has formally entered into a contract with the Watts Labor Community Action Committee under which the Saugus Rehabilitation Center will be operated on a year-round basis as a training and recreation center for youngsters.

Mayor Sam Yorty signed the contracts which allow WLCAC to operate a three-point program at the 581-acre Saugus facility.

Elements of the program are:

- A 12-month work-training program aimed primarily at giving recently discharged veterans who have no trade training in construction work and marine cook and steward work.
- A weekend program of recreation, work and remedial education for 14-and 15-year olds in the Neighborhood Youth Corps as well as so-called disadvantaged school youngsters.
- A summer program next year for underprivileged youths similar to the program WLCAC operated this year for 4000 children.

At the same time, WLCAC will engage in a research and planning program to develop further uses for the Saugus acreage.

In a parallel development yesterday, City Council's Public Works Committee ordered a study of the possibility of freeing Los Angeles from the real estate tax. It now must pay taxes on the Rehabilitation Center.

Under a technicality in the law, the city is billed for real property taxes on the Saugus land because it is located in the county and outside the city limits.

THE MINNEAPOLIS STAR Fri., Oct. 4, 1968

$40,000 Provided Low-income Citizens

More than $40,000 in loans and outright grants to help low-income Minneapolis residents buy homes or start new businesses have been approved under two new programs.

The two programs have been operating for about 45 days using money which has been anonymously contributed by a group of Minneapolis families. Applications for the loans and grants are reviewed and approved by two task forces of the Minneapolis Urban Coalition.

Grants of up to $700 are available for down payments on homes. Harry Jensen, a vice-president of Northwestern National Bank who co-chairs the task force in charge of the down payment grants, said the grants are enough to obtain financing for homes costing up to $17,000.

Jensen said at a coalition meeting Thursday that so far his task force has received 100 applications for down payment grants and approved 51. The applicants each, and the total amount received an average of $443 approved is $22,583.

51 Recipients

Of the 51 recipients, 35 were black, 12 were white, five were Indian and one was Mexican, Jensen said. AFDC mothers account for 27 of the recipients.

They have an average of four children. Thirty of the recipients have four or more children, he said.

The loan program, which provides "seed money" to start new businesses, has so far loaned $17,900.

Borrowers have been able to use the money to get $65,000 more from the Small Business Administration and other sources of financing.

The money which has been loaned so far as been used to start five new businesses, according to coalition officials. They include a restaurant, a tailor shop, a beauty shop and two others that officials did not identify by classification.

SCHOOL FAILURES (continued)

Mr. McLaren has found this observation supported by students. Often children with learning disabilities are highly sensitive to the nuances of the graphic or pictorial arts or they achieve their most satisfying rewards in such areas.

The most serious problem, Mr. McLaren says, is recognizing the child with a learning disability before his future is seriously jeopardized. Without early diagnosis, many children iwth learning disabilities never achieve their full potential. Even though they are intelligent enough to assimilate college material, they are refused entrance to college or unable to keep pace with their classmates.

To accommodate these students, Mr. McLaren would like to see special programs in colleges to provide for the needs of those with learning disabilities. As another remedy he suggests that special schools could be extended to the college level using methods that have been used successfully in secondary schools.

A recently formed commission, the National Advisory Committee on Dyslexia and Related Disorders, has been investigating approaches to the problems of learning disabilities. Dr. Clements, who is acquainted with members of the committee, says that the indications are that the group will recommend that H.E.W. become active in the sponsorship of research and work in this field.

THE NEW YORK TIMES, SATURDAY, OCTOBER 5, 1968

Elizabeth's Welfare Burden Is Like Cities' Across Nation

By BILL KOVACH
Special to The New York Times

ELIZABETH, N. J., Oct. 4—The problem of dealing with those unable to help themselves is deeply imbedded in the daily welfare operation of this city and reaches out to touch, in one way or another, the lives of everyone here.

A decade of increasing concern at the state and Federal levels for the disadvantaged and the urban centers in which they congregate has led to new and constantly revised laws. These laws have come to rest here, at the point of implementation, with local government.

Elizabeth, then, like most industrial cities, is confronted with what is becoming a national welfare dilemma. As more funds and civic energy are poured into welfare, less is available for rebuilding the cities' rottening slums and deteriorating schools.

Migration from Country

As the flow of rural imigrants—many of whom go on welfare—to the cities has increased, so too has the outward movement of the middle-class population to the suburbs, thereby draining the city not only of needed tax resources but also of much of its creative force.

In Elizabeth, 17 per cent of the welfare caseload is from out-of-state applicants and the number will be higher next year. The caseload has jumped from 3,900 to 5,320 in the two years between 1965 and 1967, and each case represents at least four persons.

"We have become a sponge to absorb all the problems of an urban society," is the way John J. McGoohan describes the situation in which a local official now finds himself.

Although he speaks for Elizabeth, his words are echoed by city officials across the country dealing with people caught up in problems they cannot solve alone. These people and their problems are a primary concern of almost every city in America today.

Each city has its specialist charged with solving this problem and each has his particular title.

For Mr. McGoohan, the title is Director of Health, Welfare, Housing and Inspectors. It is a job as large as its title, but it is around the word "welfare" that his problems tend to center.

"When you deal with the welfare of people—the basis of their living—you always find yourself involved in the whole range of city life," he said in an interview this week.

Then, waving to a pile of correspondence and an appointment book filled with the cumbersome titles of public and private agencies of urban concern, he added:

"We here are on the firing line every day, attempting to implement laws passed at the federal and state level for the purpose of solving urban problems.

"The indications are clear that we can't effectively enforce the laws that have been passed to ease these problems."

Recipients Caught in Web

Those on the other end are caught in a web themselves.

One woman welfare recipient who feels trapped by the system said:

"If I could, I would go back to Missouri. That's where my people are. But the welfare checked and they told me the law there is that I can't come back there to go on welfare—so I'm stuck here and there's nothing I can do and no place I can go."

This hopelessness of people and the conflict between needs and laws is the universal point upon which the welfare programs of cities across the country constantly stick.

The New York Times · Oct. 5, 1968

Elizabeth, except briefly in the flickering spotlight of early American history—the first Colonial Congress was held here in 1668; Aaron Burr and Alexander Hamilton were educated here, and John Hollard built the world's first successful submarine here—has developed much the same as other cities across the country.

Fronting on Staten Island Sound and Newark Bay, 14 miles west of New York City, it was a natural site for the development of an industrial city.

Light manufacturing, chemicals and oil industries came at the turn of the century, setting the pattern for the city's development as an industrial center. For a half century or so, the city was kept busy tooling up for war production, soaring on the winds of prosperity or fighting its way out of despression.

Through it all, as the city grew to its present size of 120,000 people, currents moved unnoticed. Almost half of its houses were built by 1929 and many were decaying. A vast migration of people—unskilled, uneducated and untrained—had been moving from the South to the industrial centers of the North.

Elizabeth, like cities all over the country, had become a part of the "urban crisis." Nineteen per cent of all her housing was labeled substandard; a shift to the suburbs by the population was draining tax resources; welfare case loads for the city alone jumped from 3,990 to 5,320 cases in two years (1965-67).

Almost any card in the welfare caseworker's file tells the story, as does the following case.

Nearly two years ago, a welfare family (the wife, husband and 11 children) was dislocated from adjacent Hudson County when their home was condemned. They moved into an unoccupied house in the heart of an urban-renewal project in Elizabeth.

Whole Set of Problems

"When we found them there," says Mr. McGoohan, "we came up against a whole effort to rebuild the city."

He could not move them from the house unless he could find alternative housing—and there was none available. Acquisition of this, the last remaining piece of private property within the renewal area, had to be delayed.

Meanwhile, Mr. McGoohan required the landlord to make repairs to make the house safe to live in. The net effect was to increase the rent and thereby the amount of public assistance the family required. It also could raise the cost of the property to the city when it was eventually acquired for the renewal project.

And there the problem rests, nearly two years later, hung on the twin problems of substandard housing and welfare.

Victor W. Liotta, director of the Union County Welfare Office, offered further insight into the city and its welfare predicament.

"The cities act as a magnet, drawing people without jobs, or without good jobs, from all over the country," he said. "When they come, if the jobs don't work out, they wind up on our welfare rolls."

People without means must establish a residence to apply for welfare. The only residence most can afford are the very cheapest of houses. These are found in city tenements.

Once they are established in such dwellings, the city assumes their responsibility. Without enough low-cost housing, the city finds there is no place to move them without prohibitive costs.

"The simple fact is the cities are not and cannot move fast enough to clear substandard housing of people and replace them with adequate low-cost units," Mr. Liotta said.

These are problems, Elizabeth's welfare experts agree, that the city is hard put to solve, no matter how much financial aid is offered by federal and state governments.

In a county that now pays $14.37 per capita to support welfare costs of $8,209,996 this year, Elizabeth has a city tax rate of $7.51—higher than 13 other communities in the county. To go higher might prompt even more taxpayers to move from the city.

"In the last analysis," Mr. McGoohan said, "if we could somehow maintain a relatively stable population of relief cases we might be able to attack the problem sensibly.

"As it is now, substandard housing refills faster than we can vacate it and programs designed to deal with 500 people usually must be applied to 800 people because of the influx occurring between the time the program is conceived and put into effect."

The movement of transients to New Jersey and other northern states with liberal welfare programs is seen by the County Welfare Director, Mr. Liotta, as welfare's central problem.

"There is a desperate need for a national reorganization." Mr. Liotta said. "There must be some national standards set so that a welfare recipient in any given state is as well off as he would be in any other.

"Under the present system — with states determining much of the basic structure of the welfare program—a state like ours that sees its job as one of meeting existing and necessary needs tends to become a recipient state."

Both Mr. Liotta and Mr. McGoohan are encouraged, however, by signs that these local problems are being recognized higher up.

Easing the city and county financial burden, coupled with better national coordination, "could help stabilize the problem," Mr. Liotta concluded.

Week of September 30, 1968

Manpower — Training

7,000 TO BE TRAINED UNDER RECORD
$9.1 MILLION URBAN LEAGUE CONTRACT

WASHINGTON -- Secretary of Labor Willard Wirtz has announced approval of a $9.1 million contract with the National Urban League, the largest single contract in the six-year history of the Manpower Development and Training Act.

The on-the-job training contract will provide for the training of 7,000 hard-core disadvantaged in 26 cities.

Urban league Director Whitney M. Young, Jr. and Secretary Wirtz signed the record agreement.

The Labor Secretary expressed confidence that "the Urban League would continue in its successful efforts to place the disadvantaged jobless into worthwhile and permanent jobs.

"The Urban League has proven to be one of the most productive organizations in reaching those disadvantaged individuals who will benefit most from job training and placement programs", Wirtz said.

"More than 18,000 jobless or underemployed persons have been placed in jobs to date through Urban League programs," he added.

The Urban League has been given 75 contracts in the past four years to train more than 22,000 persons in 45 cities.

Mr. Young said that "the new contract will assure many more minority citizens in this country the economic means for fuller participation in the actuality of the American dream."

(MORE)

"Such confidence between public and private agencies means not only jobs but enhances the leadership and motivation in Black communities nation-wide. The true spirit of partnership is manifest here today," he said.

The new contract calls for training slots requiring anywhere from 4 to 52 weeks of on-the-job instruction. Practically all types of semiskilled and skilled occupations available in a big city will be developed for 6,580 jobless persons and opportunities for 420 persons who need their skills upgraded to earn a decent wage.

The Labor Department contract earmarks $8.8 million for distribution through subcontracts to Urban League affiliates in the 26 cities, with the balance of $331,799 being retained by the National Urban League for administration of the program over an 18-month period.

The largest trainee and dollar amount has been allocated to four Urban League affiliates in California with 1,250 trainees and $1.5 million. The affiliates are in Los Angeles, 550 trainees, $691,430; San Francisco, 400, $502,850; Oakland, 200, $251,430, and San Bernadino, 100, $125,718.

New York State also has four Urban League cities with a total of 950 trainess and $1,194,286 in funds. The cities are Buffalo, 350 trainees, $439,999; New York City, 200, $251,429; Rochester, 200, $251,429; and Westchester, 200, $251,429.

(MORE)

The other cities are:

City	No. of Trainees	Cost
Washington, D.C.	200	$251,428
Atlanta	350	440,000
Chicago	500	628,572
Gary	500	628,571
Louisville	150	377,143
Boston	300	377,143
Baltimore	200	251,428
Lansing	100	125,714
Kansas City	200	231,420
St. Louis	250	314,293
Akron	200	251,429
Cincinnati	300	377,143
Columbus	200	251,429
Tulsa	200	251,429
Philadelphia	300	377,142
Memphis	400	502,856
Seattle	300	377,142
Milwaukee	150	188,571
	Total Sub-contracting funds	$8,800,000

Some of these cities have uncompleted Urban League contracts. New subcontracts from the National Urban League will not be awarded until these contracts are completed.

(MORE)

NEWS DIGEST - 9/30/68
7,000 TO BE TRAINED - P.4

In addition to the on-the-job training programs, the Urban League has been active in Apprenticeship Outreach programs in 11 cities, assisting young unprepared Negro men for apprenticeship examinations in four-week "cram" courses. The AFL-CIO building and construction trades councils in these cities are assisting the Urban League in this effort. More than 100 men have been placed by the League in apprenticeship programs to date.

Chrysler Initiates Training of Negroes

By DICK HEBERT

The Southern Christian Leadership Conference and the Chrysler Corp. jointly announced here Tuesday an agreement to bring automotive money, training and dealerships to Atlanta's Negro community.

The package agreement involves three actions by the nation's third-largest auto-builder:

1. The corporation deposited $100,000 Tuesday in Atlanta's Negro-owned bank, the Citizens Trust Bank, and agreed to deposit that much monthly. The money is part of the corporation's federal tax payments, paid into a U.S. Treasury account at the bank for periodic withdrawals by the federal government.

50 MECHANICS

2. A massive training pgoram has been started for Negroes to prepare them for jobs as auto mechanics. The nationwide program hopes to place some 3,000 minority youths in apprenticeship positions, 50 of them in Atlanta.

Urban affairs specialist for Chrysler, Albert J. Dunmore, said his company is having "a problem finding 50 recruits for the apprenticeship program here" because the youths must be "willing to give up six months to a year for training."

3. The corporation now is training six Negroes for new-car dealerships in the country and is making a preliminary survey of sales potential for a possible Negro-owned dealership in Atlanta.

Dunmore, a Negro hired a year ago, said the nation now has only eight Negro-owned new-car dealerships, five of them dealing in Chrysler Corp. cars. "Atlanta may be six months away or it may be two years away, he said, depending on whether the person found to begin the operation already has experience or needs a full two-year training program.

BUY, SELL CARS

Depositing tax mony in Ngro banks—as Chrysler has done in a few other cities—means a loosening of credit for expansion of the economy in the black community, he asid.

SCLC President Rev. Ralph D. Abernathy issued a statement from his Atlanta hospital room, saying that the "black community, like any other community, wants its own financial institutions, because such institutions have a better understanding of community needs, and if only they have the funds, they will serve those needs.

"Black people also feel that, if they buy cars, then black businessmen should have an opportunity to sell the cars and black workers should have an opportunity to build them."

Abernathy is hospitalized recovering from penumonia. He termed the announcement a "milestone agreement."

BEGAN IN SPRING

The agreement came from private talks that began last spring, SCLC said. Abernathy's statement said the procedure "was one of quiet, private deliberations among reasonable men (which) show that SCLC is willing to apply our philosophy of non-violence without public confrontation if the other party is willing to accept a fair settlement."

Dunmore said the talks began and were carried on "without even the threat of a picket or a boycott."

THE ATLANTA CONSTITUTION, Wednesday, Dec. 4, 1968

Jobs Decline in State; Loss Confined to Farms

Employment dropped in Georgia in October to 1,768,700, a loss of 19,700 from the September level, the Georgia Department of Labor reported Tuesday.

The loss was blamed on a seasonal reduction of 20,300 in agricultural workers. A small gain (600) was recorded in non-farm employment in the state.

Unemployment declined for the fourth straight month. A drop of 9,200 was recorded in the ranks of the unemployed from the September figures.

That was a reduction of 3,000 from the October a-year-ago level.

The rate of joblessness this month equaled the all-time low for the period since the Department of Labor began publishing statistics on this category.

In the Atlanta area employment increased slightly to 623,-900, marking the second straight month that a new all-time employment high has been registered.

The level represented only a 100-job gain over the September figures but would have been substantially higher except for a labor dispute, the department reported.

Unemployment in the Atlanta area fell moderately to 14,200 from the September count of 15,-900. The October figure represented 2.2 per cent of the labor force compared to 2.5 per cent for September.

The outlook for the Atlanta area is for another record peak in mid-December with the accelerated pace of the Christmas trade activity contributing to the upswing.

BORROWING ASKED FOR JOB TRAINING

$30-Million Capital Budget Item Proposed by H.R.A.

By SETH S. KING

The borrowing of $30-million to finance a new system of job training and counseling for the city's unemployed was requested yesterday by the Human Resources Administration.

By shifting this type of welfare cost to next year's capital budget, the Lindsay administration would remove a major item from its pay-as-you-go expense budget and instead would finance the new program by borrowing.

Deputy Mayor Robert W. Sweet also disclosed that the Human Resources Administration would ask for a supplemental appropriation of $9-million fro mthe capital budget for its manpower training program in the current fiscal year.

Mr. Sweet said the use of capital budget funds for manpower training was made possible for the first time last spring by the Legislature through an amendment to the local finance law.

The new job-training and counseling program was discussed by Mr. Sweet and the Human Resources Administrator, Mitchell I. Ginsberg, at a news conference in City Hall. It was held soon after the City Planning Commission announced a proposed $1.128-billion capital budget for 1969-70, the largest in the city's history.

'Human Renewal'

"The placing of manpower development expenditures in the capital budget," Mr. Ginsberg said, "embodies the principle that it is at least as important to invest in people as in buildings or machines, and New York is making a real investment in human renewal."

The new plan is an effort to end the fragmentation of job-training and employment programs administered by the city.

Mr. Sweet said: "These programs were found to be uncoordinated and were carried out by scores of agencies that did not know what the others were doing."

Part of the funds will be used to establish six new "opportunity centers" throughout the city, to be staffed by counselors and manpower specialists. They will also include facilities for vocational training and basic education courses.

Neighborhood Centers

The United States Labor Department now operates such a center in the South Bronx. Two other centers, financed with Federal funds, are scheduled to open next spring in East Harlem and Central Harlem.

The Human Resources Administration's Manpower and Career Development Agency will take over operation of these facilities and they will become a part of the city's opportunity center network.

Cyril D. Tyson, manpower and career director, said the new centers would be housed in rented space in nine neighborhoods. Two other centers will be added, he said, if they can be organized.

The opportunity center system would provide training facilities for 12,000 unemployed people. About 10,000 are already being trained at other locations under the manpower program, Mr. Tyson said.

If the $9-million supplemental appropriation is approved by the City Council and Board of Estimate, the total manpower costs in the current year will reach $38-million. Of this, the Federal Government is providing $7-million.

In the next fiscal year the city's share of the program will be set at $30-million.

By the middle of 1969 there will be facilities for processing about 100,000 people seeking jobs or job training, Mr. Tyson said.

Florida Jobmobile Project Is Halting Hiring in Slums

MIAMI (AP)—Dade County's jobmobile, an experimental traveling employment office is being discontinued after nine months of service among slum dwellers.

Operated jointly by the county and Florida State Employment Service, the jobmobile fell short of its goals.

"It was experimental; you can't say it isn't effective. You can't say what was par," Harry Tyson, director of the employment service, said.

The project operated from a bus and was designed to reach residents who might otherwise miss out on job opportunities.

CHRISTIAN SCIENCE MONITOR DEC. 6 1968

UAW, Teamsters urge 'no raiding' to AFL-CIO

By Ed Townsend
Labor correspondent of The Christian Science Monitor

New York

The United Auto Workers (UAW) and International Brotherhood of Teamsters have jointly proposed a "universal no-raiding agreement" with the AFL-CIO, to cover the federation's 130 unions.

The federation, the country's biggest labor grouping with more than 3.25 million members, warns that the alternative could be "internal warfare" and "dissipation of labor's resources in negative and destructive raiding activities."

But the AFL-CIO is wary of the surprise peace offer from the founding unions of the new Alliance for Labor Action (ALA).

George Meany, president of the federation, and other top officers of the AFL-CIO are giving the plan "careful consideration," and, they say, a decision will be made at a federation executive-council meeting this month in Washington or in Miami Beach in February.

Safeguards stressed

Some top leaders of the AFL-CIO are willing to accept the proposal — but only with safeguards. Others flatly oppose an agreement as "just another undercutting move by Walter Reuther," a device to continue his war against his arch-foe, Mr. Meany. But most, so far, say they're undecided.

The joint proposal to the AFL-CIO and its unions was worked out at a recent Washington conference of Mr. Reuther and other UAW people and their counterparts in the Teamsters, Frank E. Fitzsimmons, acting president, and members of the union's board.

The two allies in ALA agreed on the draft of a letter to Mr. Meany and to the president of every AFL-CIO affiliate, to restate the purpose of ALA ("not a competing labor federation," they say) and to offer the agreement to "join with others . . . to refrain from seeking to organize workers who are presently organized and represented by a bona fide union as their authorized bargaining agent."

Committee suggested

The letter added, "such an agreement will put an end to all the speculation and uncertainty that the labor movement is moving toward internal warfare and will instead insure that the resources and the goodwill of the labor movement will not be dissipated in negative and destructive raiding activities," the letter said.

It urged that a committee representing the AFL-CIO, UAW, and Teamsters go to work quickly on the specific provisions of a plan having "an effective and appropriate enforcement mechanism, including a terminal step."

A "universal no-raiding agreement" is the only answer to today's needs, Messrs. Reuther and Fitzsimmons said in the letter carrying at its top the official seals of their two unions.

Within the AFL-CIO, the fact that the letter was sent to every union nettled many officials. Mr. Reuther similarly broadcast letters of complaint about the Meany leadership of the federation in his long campaign for changes in the AFL-CIO, before UAW withdrew from the federation earlier this year. After the withdrawal he sent out letters about UAW's reasons for the break and, later, about UAW-Teamsters plans for the new ALA.

Many in top leadership ranks in the AFL-CIO strongly resent Mr. Reuther's apparent efforts to circumvent Mr. Meany's objections to Mr. Reuther's proposals. One said early this year, and repeated this week, "Walter is quick about resenting employer's efforts to go directly to auto members, to get around the union, but he doesn't hesitate to do the same sort of thing when it serves his purposes."

The Reuther-Fitzsimmons letter explained that since the proposed no-raiding pact "concerns all of the affiliates of the AFL-CIO, we are addressing it to each affiliate. . . . We would appreciate your advising us of the attitude of your organization concerning our proposal."

Dilemma posed

Many in the AFL-CIO interpret this as an invitation for individual unions to sign peace pacts with ALA if AFL-CIO doesn't accept the universal agreement. Mr. Meany and the federation's executive council have declared ALA a "dual organization" and have barred AFL-CIO affiliates from having anything to do with ALA — or UAW and the Teamsters. They could be expelled if they do.

Ordinarily, a no-raiding pact isn't construed as dealing with an enemy. Before the merger of the AFL and the CIO in 1955, the two major labor bodies had a no-raiding agreement, and the AFL-CIO has never acted to upset agreements between its affiliates and the Teamsters, expelled from the federation in late 1957, despite its official position against joint action of any kind with the Teamsters.

Officially, Mr. Meany and his executive council (scheduled for a special meeting Dec. 16) face the problem of accepting or rejecting what would be a beneficial no-raiding arrangement with the ALA. By accepting they could, in effect, weaken their position that ALA was established as a divisive labor center, threatening the AFL-CIO. But by rejecting the peace plan, they would leave the AFL-CIO and its present leadership open to strong criticism and, perhaps, loss of some support among affiliates.

One executive-council member said privately that the Reuther-Fitzsimmons move was "a good public-relations gimmick—we can lose but they can't.

He added, "Walter is a smart strategist. He made us suspend UAW, and then pulled out of AFL-CIO without being accused of splitting our ranks. He set up ALA with Fitzsimmons in a way that doesn't appear on the surface to be a new federation but could be at any time.

Policing discussed

"George Meany blocked that ploy by making memberhip in ALA a cause for expulsion from AFL-CIO. Now Walter's found a new way to approach our unions. If we don't accept the peace plan, Walter will exploit the rejection. The next move is up to Meany."

Another council member, P. L. (Roy) Siemiller, president of the International Association of Machinsts, which recently has fought off UAW and Teamsters raids, said he wouldn't oppose a no-raiding pact with the two unions—provided the agreement contained effective methods for policing the plan, an arbitration system, and bonding arrangements to hold a violator financially and organizationally liable for violations.

PHILADELPHIA INQUIRER.

C of C Praises Shafer's OK on Trainee Funds

Greater Philadelphia Chamber of Commerce on Thursday praised Gov. Raymond P. Shafer for allocating $200,000 to provide living allowances for trainees in Philadelphia's apparel industry.

John P. Bracken, Chamber president, said the governor's action marked a breakthrough in the Chamber's five-year campaign to provide job training in the labor-short apparel industry.

Shafer's announcement last week will make available to 800 trainees weekly allowances of $35 for seven to eight weeks as soon as a contract is signed between State and Chamber-affiliated Greater Philadelphia Foundation. It will take four to five weeks to negotiate the final contract.

3000 JOBS AVAILABLE

Spokesmen for the four major trade associations in the apparel industry — the city's largest — and three unions pointed out there are more than 3000 entry jobs for those trained with the necessary skills. Approximately 200 men and women can be trained for jobs at a time.

Recruitment and placement of trainees will be through the offices of the Bureau of Employment Security, Pennsylvania Department of Labor and Industry.

The Opportunities Industrialization Center, the Urban League, Northcity Congress, the Black Coalition and other neighborhood organizations will be asked to encourage men and women to apply for training.

APPLY LOCALLY

Bracken suggested that interested individuals and organizations apply to the local Pennsylvania State Employment offices.

William Davis, regional coordinator for Eastern Pennsylvania, Department of Community Affairs, is coordinating the project.

Meanwhile, it was announced Friday that the Chamber has submitted new proposals to the Shafer Administration requesting $459,238 for the funding of two more programs to aid minority groups in the business and employment fields.

The programs would provide management counsel to minority groups setting up businesses for the first time and free child-care centers to needy mothers who want employment in labor-short industries.

Mild Labor Secretary

George Pratt Shultz

By DAVID R. JONES

Special to The New York Times

WASHINGTON, Feb. 28—George P. Shultz was savoring the luxury of a fellowship at the Center for Advanced Study in the Behavorial Sciences last Dec. 3 when a telephone call came from Arthur Burns, the economist, an agent for President-elect Nixon. Before the day was out, Mr. Shultz was on the telephone with Mr. Nixon. Eight days later, whisked from his California academic retreat to the blazing lights of nationwide television, a stunned Mr. Shultz found himself being introduced here as the new Secretary of Labor.

Man in the News

The 48-year-old former labor relations professor now appears to have overcome the shock of that sudden transformation.

But to this day he insists he has "no idea" why Mr. Nixon, whom he had never met, plucked him out for the Labor post.

That selection was not so mystifying to Mr. Shultz's many supporters, who give him high marks as a pragmatist as well as a scholar. "George is a guy who's moderate and open-minded," said a close friend. "George isn't an intellectual. He can operate in an intellectual environment, but he tends to think pragmatically."

Much Like Old Job

Secretary Shultz, who is calling for a drastic change in the administration and funding of the Federal manpower programs to permit greater flexibility and local control, sat before a crackling fire in his paneled conference room here the other day and discussed his new job. A bespectacled man who is mild both in appearance and manner, he spoke slowly, directly, and barely audibly.

The problems of administering the Labor Department, he said, are not notably different from those of running the University of Chicago Graduate School of Business, from which he took leave as dean last year to study in California. "The great difference is the groups that you work with, which demand a major effort for a newcomer to understand," he said.

Mr. Schultz said that "the whole problem of unemployment, or raising emploment," would receive top priority with him. He deplored the "appalling rate" of joblessness in urban slums and expressed hope that it could be cut even though the Nixon Administration will try to slow the economy.

Another big problem, he said, will be how to handle labor strife, now at its high est level in a decade. Although Mr. Nixon has said that his Labor Secretary might be able to mediate some crises before they became major strikes, Mr. Schultz made clear that he favors a hands-off approach. He said the nation must suffer some strikes as the price of preserving free collective bargaining.

Support From Both Ends

Mr. Schultz—a Republican—has yet to face his first major test as Secretary, but he is taking over with support from both ends of the political spectrum.

Businessmen were among his stronger backers for the post. Organized labor, while preferring someone more liberal, is still pleased to get off so well under Mr. Nixon.

The Secretary's only serious gaffe so far has been to beat George Meany, president of the American Federation of Labor and Congress of Industrial Organizations, at golf.

"As an economist, he's a moderate," said a close friend. "He accepts the necessity of government action in some areas, but he doesn't see government as a cure-all." An academic acquaintance said Mr. Shultz was "somewhat more distrustful of big government than many liberals."

George Pratt Schultz was born Dec. 13, 1920, into a prosperous New York family, son of a history Ph.D. who began the New York Stock Exchange investor education program.

Mr. Shultz was reared in New Jersey and was graduated from Princeton University with honors in economics in 1942. After three years as an officer in the Marine Corps, with which he served in the Pacific, he earned a Ph.D. in economics at Massachusetts Institute of Technology in 1949.

He served on the M.I.T. faculty until 1955 as an industrial relations professor and was a senior staff economist for the President's Council of Economic Advisers in 1955 and 1956. He then went to Chicago as a professor in the graduate school, rising to dean in 1962.

He also served as co-chairman on the Armour Automation Fund Committee, an experiment in easing the impact of automation on workers.

'Golf and Tennis Nut'

The new Labor Secretary is no table pounder. A friend characterized him as "a low-key guy" who "controls himself and won't over-react." But he can sometimes be stubborn, a Chicago associate said, and "some faculty members who went in to see Schultz said they are going to get a pipe so they could puff back at him."

A friend said that 6-foot, 190-pound Mr. Schultz is a "golf and tennis nut," covering the links in the summer in the low 80's and playing indoor tennis in the winter. He is partial to martinis on the rocks, an associate said, and "one of his big recreations is his friends."

The new Labor Secretary was married in 1946 to Helena M. O'Brien, a former Army nurse he met in Hawaii. He and "Obie" have five children: Margaret, 21; Kathleen, 19; Peter, 16; Barbara, 11, and Alexander, 9.

Mr. Schultz owns a vacation home at Swift River, Mass., and for a while he was saddled with two other houses as well: the one he was renting in California and his permanent home in Chicago. But now those two have been replaced by a big red brick house in suburban Arlington, Va.—where the brown winter grass has been sprayed green by his real estate agent.

Manpower — EEO — Govt.

BALTIMORE SUN MAR 1

Stymied By Civil Service, OEO Fails On Vow To Poor

By ARNOLD R. ISAACS

[Washington Bureau of The Sun]

Washington, Feb. 28—The Office of Economic Opportunity has been unable to make good on its promise to the leaders of last spring's Poor People's Crusade to let down hiring barriers so that "several hundred disadvantaged poor" could join the agency's staff.

Officials of the anti-poverty agency confirmed today that an adverse opinion from the Civil Service Commission staff has blocked efforts to eliminate normal testing procedures for "hard-core" poor recruits. "We have to reassess," one official said.

December 31 Opinion

The unfavorable opinion was submitted December 31, but was not publicly announced. The Poor People's Crusade organizers who were given the original promise apparently were not informed. An OEO spokesman explained: "They haven't returned even to ask about it."

Mrs. Marian Edelman, who is serving as Washington liaison agent for the Southern Christian Leadership Conference, said in a telephone interveiw:

"The last correspondence we had from them (the OEO) was in July, 1968, and we assumed the commitment still stood."

The Atlanta-based group, headed by the Rev. Ralph David Abernathy, played a leading role in organizing the Poor People's Crusade.

Brief OEO Statement

Bertrand M. Harding, the acting OEO director, issued a brief statement in response to an inquiry. "We will continue to press forward with this effort to bring poor people into government service," he said. "I am confident means can be found to accomplish this goal."

The OEO was asking authority to waive civil service examination requirements for jobs in the national headquarters in Washington and in its seven regional offices. Local anti-poverty agency workers are not federal employees and would not have been affected.

The request arose from a pledge Mr. Harding gave Mr. Abernathy last June, after the Poor People's Crusade leaders had presented a list of demands.

Harding's Promise

"We will work toward a goal of several hundred OEO positions to be filled by persons in this category," Mr. Harding wrote the SCLC leader. The agreement contemplated hiring poor people who show potential talent for anti-poverty work but do not meet regular civil service standards.

The Civil Service Commission never formally decided on the test waiver, but on the basis of staff consideration, O. Glenn Stahl, then the director of the commission's bureau of policies and standards, sent a reply which ended:

"It would take presidenttial action to provide these authorities and we do not believe we could justify asking the President to provide such favored treatment for this group."

Sympathy Expressed

Mr. Stahl has now left the commission. Stanley Berg, the chief of the bureau's merit-system section, said the commission was sympathetic, but had suggested working within the normal civil service system to bring poor people into the agency.

Mr. Berg said that the regular merit system is flexible enough, and should not be used "on a handout basis."

2,900 Employees Covered

But Glenn Johnson, deputy personnel director at the OEO, said elimination of the testing requirement "was critical to us. This was how we'd get people in." The agency's plan was to furnish special training for those hired under the special authority.

The OEO has approximately 2,900 employees who fall under federal civil service.

NEW YORK TIMES MAR 1

SOME GAINS FOUND FOR URBAN NEGRO

U.S. Report Shows Income and Education Improving

By PETER KIHSS

Negro youths have been catching up to whites in school attenrance. Negro women's earnings are just about matching those of white women in year-round jobs. And the rise in Negro family has been faster than the whites."

These are among the brighter nationwide findings reported in a special Bureau of the Census study of social and economic trends in the 212 major metropolitan areas since 1960.

But the study also shows gloomier findings for Negroes living in the central cities:

Negro men's earnings lag behind whites', as much as 16 to 35 per cent in various categories. Negro teen-agers unemployment has worsened, from 22.7 per cent in 1960 to 30.4 per cent last year. And 39 per cent of Negro children lived in homes lacking at least one parent last year, an increase from 29 per cent in 1960.

For new York City, the study reported that 266,000 families, or 13 per cent of the city's total were at the poverty level in 1959 while 208,000, or 10 per cent, were at this level year.

New York City's white poor families shrank from 198,000 to 128,000 — but its nonwhite poor families rose from 68,000 to 80,000. In Los Angeles and Llong Beach, Calif., where over-all poverty also declined, nonwhite poor families rose from 24,000 to 30,000; in Chicago, the poverty total was virtually unchanged, but nonwhite poor families rose from 55,000 to 71,000.

The census study, making no effort to assess causes, was a 67-page comparison of data generally derived from a March, 1968, population survey, with 1960 census data. The analyses generally were for all metropolitan areas, broken down to central cities and other segments as a whole, rather than citing individual cities.

The Census Bureau said data on educational attainment, employment status and type of residence in the study referred to "the time of enumeration, March, 1968, and April, 1960." The time period covered by income and poverty statistics referred to the 1967 and 1959 calendar years.

Migratory Report Cited

A report on the migratory pattern of Negroes into urban areas which was released on Thursday, showed that the influx of Negroes into central cities has slowed dramatically in the last year.

David Canty, director of Urban America, one of the groups that sponsored that study, said yesterday that there was no way of telling of how the report related specifically to the New York metropolitan area. "We worked with aggregate figures supplied by the Census Bureau, and these were never localized," he said.

In the later report, the Census Bureau said:

"Most of our indicators of well-being point toward progress in the cities since 1960. However, the rates at which positive changes are taking place will be open to differing interpretations. Likewise, where deterioration rather than progress is indicated, the impact of such negative trends is open to debate."

On the other hand, one longtime analyst of wage and welfare trends, Nicholas Kisburg, legislative director of Teamsters Joint Council 16 here, termed the study one of the most significant and "depressing" Federal statistical documents ever issued.

Mr. Kisburg said:

"What is happening in the Negro community is that simultaneously with fantastic progress on the part of many, there is unbelievable retrogression on the part of others."

Mr. Kisburg contended that the 30 per cent unemployment rate for Negro youths was an outgrowth of broken families and unsound welfare programs. The report showed unemployment among whites aged 16 to 19 years had also risen in the central cities — from 9.8 per cent in 1960 to 12.3 last year.

Current policies, Mr. Kisburg contended, could create "a lumpen proletariat—completely declassed people with no loyalty to a community, to a family or to themselves," including "whites who think they can be Lenins and Trotskys, Hitlers and Mussolinis for the black, declassed youths."

Greater Urban Populations

The census study, prepared by Arno I. Winard, of the Poverty Statistics Section, Population Division, said there were 128 million people living in metropolitan areas last year, up 14 per cent from 1960.

Of these, 58.2 million were living in the central cities, for a 1 per cent increase, and 69.9 million were living in the suburbs, a 28 per cent rise. More than half the metropolitan residents were suburbanites.

In the central cities, 45.5 million were whites, a 5 per cent decline, and 11.9 million Negroes, up 25 per cent. Negroes rose from 16 to 20 per cent of central cities' population, remaining at only 5 per cent in the suburbs.

The total population is becoming more youthful. Most of the 2.4 million increase among Negroes in central cities involved people under 25 years of age — 1.8 million. The median age of whites — half being older, half younger—stayed about the same, 32.3 years, but the Negro median age dropped from 25.6 to 21.7.

"The increase in the number of families headed by a woman indicates that more children are growing up in broken homes," the Census Bureau reported.

The study fount that 85 per cent of central-city white families had a husband and wife last year, down one point from 1960, but Negro husband-wife families shrank from 73 per cent to 66.

Thirty per cent of the Negro families had women as their heads, an increase from 23 per cent in 1960. White families headed by women rose from 10 per cent to 12.

For central-city Negro families, separation or divorce accounted for 55 per cent of the absences of a male head, and death of a husband for 25 per cent. Among white families headed by a woman, 47 per cent involved widowhood and 37 per cent separation or divorce.

While 88 per cent of white children under 18 in central cities were living with both parents, a three-point decline from 1960, the proportion of Negro children living with both parents slid from 71 per cent to 61 per cent.

The difference in schooling between whites and Negroes was described as having "narrowed substantially between 1960 and 1968."

Central-city Negroes 25 to 29 years old had completed a median 11.4 years of school in 1960, and increased this to 12.2 years last year. White educational attainment remained virtually unchanged at 12.6 years.

Sixty-one per cent of Negroes of these ages had had four years of high school by last year, as against 43 per cent in 1960. The white percentage rose from 66 to 77.

Unemployment dropped from 5.8 per cent in 1960 to 4.3 per cent last year for central-city residents 16 years and older. Negro unemployment was 7.8 per cent, compared with 3.5 per cent for whites.

However, unemployment for youths aged 16 to 19, including both races, increased — from 11.8 per cent to 16.1.

Almost half of the white men employed in central cities — 47 per cent — had white-collar jobs last year, as compared with only 21 per cent of Negro men. There had been little change in occupational distribution in either group.

By contrast, the proportion of Negro women in white-collar jobs rose from 21 per cent to 33. Their former 34 per cent employment as private household workers declined to 20 per cent.

Central-city Negro families' median income rose 28 per cent from $4,397 in 1959 to $5,623 in 1967 — based on dollars of equivalent purchasing power. White families' income, while at a higher base, rose less—16 per cent, from $7,160 to $8,294.

The Negro families' income was 61 per cent of white families' in 1959, climbing to 68 per cent in 1967. By 1967, Negro families with two earners had a total median income of $7,225 — "roughly equivalent," the study noted, to the $7,285 for white families with one earner.

The Census Bureau found "a dramatic increase in the proportion of Negro families with higher incomes." By 1967, a total of 18 per cent in central cities had incomes of $10,000 or more, compared with 7 per cent in 1959. Such incomes were reached by 38 per cent of white families in 1967, compared with 27 per cent in 1959.

One regional oddity showed the Northeast as the only region where the Negro family income declined in comparison to the whites — a one-point decrease to 68 per cent of white income in 1967 — although dollar value rose from $4,790 to $5,385.

Mr. Kisburg, the union economist, noted this indicated a narrowing of the difference between Negro incomes in the Northeast and the South. In 1959, Negro family income in the Northeast was $1,336 above the South; in 1967, the gap was only $370, as Southern Negro family income rose from 52 per cent of Southern white income to 62 per cent.

Central-city Negro men who worked year-round in 1967 had median earnings of $5,179, or 71 per cent of whites —about the same as in 1959. But Negro women raised their proportion from 59 per cent of white women's earnings in 1959 to 73 per cent in 1967, with median earnings of $3,020 —the low total reflecting low pay for domestics.

For 1967 Negro year-round workers' median earnings in central cities, the study gave the following data:

Category	Earnings	Per Cent of White
MEN		
Professional and managerial	$6,208	65
Clerical and sales	5,515	80
Craftsmen and foremen	5,962	79
Operatives	5,414	84
Nonfarm laborers	4,492	84
Service workers, excluding private household	4,159	75
WOMEN		
Professional and managerial	6,209	105
Clerical and sales	4,425	103
Operatives	3,296	92
Private household	1,410	160
All other service	2,905	95

Of the nation's 26.1 million people below the poverty level in 1967, the study reported 8.3 million were in central cities and 4.9 million in suburbs. The national number of poor people had dropped one-third since 1959—38 per cent for whites, 21 per cent for Negroes.

The poor in central cities in 1967 included 4.7 million whites, or 10 per cent of their white population, and 3.5 million Negroes, or 30 per cent of their Negro residents. These represented decreases from 7.1 million whites and 4.1 million Negroes in 1959.

By 1967, 42 per cent of the central-city poor families were Negroes, as against 36 per cent in 1969.

The new study, entitled "Trends in Social and Social and Economic Conditions in Metropolitan Areas," Series P-23, No. 27, is to be available for 70 cents a copy from the Superintendent of Documents, United States Government Printing Office, Washington, D. C. 20402.

Mild Labor Secretary

George Pratt Shultz

By DAVID R. JONES

Special to The New York Times

WASHINGTON, Feb. 28—George P. Shultz was savoring the luxury of a fellowship at the Center for Advanced Study in the Behavorial Sciences last Dec. 3 when a telephone call came from Arthur Burns, the economist, an agent for President-elect Nixon. Before the day was out, Mr. Shultz was on the telephone with Mr. Nixon. Eight days later, whisked from his California academic retreat to the blazing lights of nationwide television, a stunned Mr. Shultz found himself being introduced here as the new Secretary of Labor.

Man in the News

The 48-year-old former labor relations professor now appears to have overcome the shock of that sudden transformation.

But to this day he insists he has "no idea" why Mr. Nixon, whom he had never met, plucked him out for the Labor post.

That selection was not so mystifying to Mr. Shultz's many supporters, who give him high marks as a pragmatist as well as a scholar. "George is a guy who's moderate and open-minded," said a close friend. "George isn't an intellectual. He can operate in an intellectual environment, but he tends to think pragmatically."

Much Like Old Job

Secretary Shultz, who is calling for a drastic change in the administration and funding of the Federal manpower programs to permit greater flexibility and local control, sat before a crackling fire in his paneled conference room here the other day and discussed his new job. A bespectacled man who is mild both in appearance and manner, he spoke slowly, directly, and barely audibly.

The problems of administering the Labor Department, he said, are not notably different from those of running the University of Chicago Graduate School of Business, from which he took leave as dean last year to study in California. "The great difference is the groups that you work with, which demand a major effort for a newcomer to understand," he said.

Mr. Schultz said that "the whole problem of unemployment, or raising emploment," would receive top priority with him. He deplored the "appalling rate" of joblessness in urban slums and expressed hope that it could be cut even though the Nixon Administration will try to slow the economy.

Another big problem, he said, will be how to handle labor strife, now at its high est level in a decade. Although Mr. Nixon has said that his Labor Secretary might be able to mediate some crises before they became major strikes, Mr. Schultz made clear that he favors a hands-off approach. He said the nation must suffer some strikes as the price of preserving free collective bargaining.

Support From Both Ends

Mr. Schultz—a Republican—has yet to face his first major test as Secretary, but he is taking over with support from both ends of the political spectrum.

Businessmen were among his stronger backers for the post. Organized labor, while preferring someone more liberal, is still pleased to get off so well under Mr. Nixon.

The Secretary's only serious gaffe so far has been to beat George Meany, president of the American Federation of Labor and Congress of Industrial Organizations, at golf.

"As an economist, he's a moderate," said a close friend. "He accepts the necessity of government action in some areas, but he doesn't see government as a cure-all." An academic acquaintance said Mr. Shultz was "somewhat more distrustful of big government than many liberals."

George Pratt Schultz was born Dec. 13, 1920, into a prosperous New York family, son of a history Ph.D. who began the New York Stock Exchange investor education program.

Mr. Shultz was reared in New Jersey and was graduated from Princeton University with honors in economics in 1942. After three years as an officer in the Marine Corps, with which he served in the Pacific, he earned a Ph.D. in economics at Massachusetts Institute of Technology in 1949.

He served on the M.I.T. faculty until 1955 as an industrial relations professor and was a senior staff economist for the President's Council of Economic Advisers in 1955 and 1956. He then went to Chicago as a professor in the graduate school, rising to dean in 1962.

He also served as co-chairman on the Armour Automation Fund Committee, an experiment in easing the impact of automation on workers.

'Golf and Tennis Nut'

The new Labor Secretary is no table pounder. A friend characterized him as "a low-key guy" who "controls himself and won't over-react." But he can sometimes be stubborn, a Chicago associate said, and "some faculty members who went in to see Schultz said they are going to get a pipe so they could puff back at him."

A friend said that 6-foot, 190-pound Mr. Schultz is a "golf and tennis nut," covering the links in the summer in the low 80's and playing indoor tennis in the winter. He is partial to martinis on the rocks, an associate said, and "one of his big recreations is his friends."

The new Labor Secretary was married in 1946 to Helena M. O'Brien, a former Army nurse he met in Hawaii. He and "Obie" have five children: Margaret, 21; Kathleen, 19; Peter, 16; Barbara, 11, and Alexander, 9.

Mr. Schultz owns a vacation home at Swift River, Mass., and for a while he was saddled with two other houses as well: the one he was renting in California and his permanent home in Chicago. But now those two have been replaced by a big red brick house in suburban Arlington, Va.—where the brown winter grass has been sprayed green by his real estate agent.

BALTIMORE SUN MAR 1

Stymied By Civil Service, OEO Fails On Vow To Poor

By ARNOLD R. ISAACS

[Washington Bureau of The Sun]

Washington, Feb. 28—The Office of Economic Opportunity has been unable to make good on its promise to the leaders of last spring's Poor People's Crusade to let down hiring barriers so that "several hundred disadvantaged poor" could join the agency's staff.

Officials of the anti-poverty agency confirmed today that an adverse opinion from the Civil Service Commission staff has blocked efforts to eliminate normal testing procedures for "hard-core" poor recruits. "We have to reassess," one official said.

December 31 Opinion

The unfavorable opinion was submitted December 31, but was not publicly announced. The Poor People's Crusade organizers who were given the original promise apparently were not informed. An OEO spokesman explained: "They haven't returned even to ask about it."

Mrs. Marian Edelman, who is serving as Washington liaison agent for the Southern Christian Leadership Conference, said in a telephone interveiw:

"The last correspondence we had from them (the OEO) was in July, 1968, and we assumed the commitment still stood."

The Atlanta-based group, headed by the Rev. Ralph David Abernathy, played a leading role in organizing the Poor People's Crusade.

Brief OEO Statement

Bertrand M. Harding, the acting OEO director, issued a brief statement in response to an inquiry. "We will continue to press forward with this effort to bring poor people into government service," he said. "I am confident means can be found to accomplish this goal."

The OEO was asking authority to waive civil service examination requirements for jobs in the national headquarters in Washington and in its seven regional offices. Local anti-poverty agency workers are not federal employees and would not have been affected.

The request arose from a pledge Mr. Harding gave Mr. Abernathy last June, after the Poor People's Crusade leaders had presented a list of demands.

Harding's Promise

"We will work toward a goal of several hundred OEO positions to be filled by persons in this category," Mr. Harding wrote the SCLC leader. The agreement contemplated hiring poor people who show potential talent for anti-poverty work but do not meet regular civil service standards.

The Civil Service Commission never formally decided on the test waiver, but on the basis of staff consideration, O. Glenn Stahl, then the director of the commission's bureau of policies and standards, sent a reply which ended:

"It would take presidenttial action to provide these authorities and we do not believe we could justify asking the President to provide such favored treatment for this group."

Sympathy Expressed

Mr. Stahl has now left the commission. Stanley Berg, the chief of the bureau's merit-system section, said the commission was sympathetic, but had suggested working within the normal civil service system to bring poor people into the agency.

Mr. Berg said that the regular merit system is flexible enough, and should not be used "on a handout basis."

2,900 Employees Covered

But Glenn Johnson, deputy personnel director at the OEO, said elimination of the testing requirement "was critical to us. This was how we'd get people in." The agency's plan was to furnish special training for those hired under the special authority.

The OEO has approximately 2,900 employees who fall under federal civil service.

LABOR SUPPLY DIP FORESEEN

Nation's Manpower May Not Meet Needs Of 1970's

By RODNEY CROWTHER
[*Washington Bureau of The Sun*]

Washington, March 2—There will not be enough workers in the country to fulfill the objectives of the generally accepted national policy goals set for the 1970's, the National Planning Association said today.

The association's Center for Priority Analysis has concluded that to encompass virtually all aspects of the private and public sectors of the economy would require employment of 101 million workers—about 10 million more than are expected to be in the civilian labor force in 1975.

New Goals

The consequence, according to the association, will be that "the nation must establish priorities to determine how much of the available manpower should be devoted to each present goal, as well as to any new goals that may be added by our society in the early 1970's."

The findings were published by Dr. Leonard A. Lecht, director of NPA's Center for Priority Analysis, in a new book "Manpower Needs for National Goals in 1970." The study was made for the Labor Department's Office of Manpower Research.

Far from facing shrinking labor demand and consequent unemployment due to automation, the National Planning Association study found that to meet national goals will require more, not less, employment.

Some of the major roadblocks to achieving national goals, Dr. Lecht found, may be occupational deficiencies such as the lack of doctors, dentists and nurses in the field of health. The country is going to need 18,000 more doctors annually, but medical schools expect to graduate only about 8,750 a year.

Need Dentists

An annual increase of 5,000 dentists a year is needed, but only about 3,200 a year were graduated in the 1960's.

Fulfilling the social welfare goal calls for about 20,000 social workers compared with a yearly than have been produced in recent past.

In the field of housing and urban development, far more skilled craftsmen will be needed than have beenproduced in recent years.

The national goals were first set forth early in the 1960's by the President's Commission on National Goals.

WASHINGTON POST MAR 3

Report Says Manpower Shortage Will Threaten Economy by 1975

A new study of the Nation's manpower needs suggests that bottlenecks in key sectors could plague the Nation's progress in the next decade.

It focuses attention on health, education and urban development as areas where personnel shortages may be particularly critical. The present shortage of physicians is likely to persist, the report says, and large new investment in urban development projects—more schools, hospitals and housing—could be frustrated by manpower deficiencies in important crafts such as carpentry and electrical work.

The report, released yesterday, was prepared by the National Planning Association, a private nonprofit research group, and was partially financed with funds from the Labor Department.

Without thoroughly investigating the Vietnam War's impact on the economy, the study does conclude that a sharp decline in war-related expenditures would probably increase unemployment, at least in the short run.

Money spent in nondefense industries would create more jobs than the same amount of money spent for defense orders, according to the report. It questions, however, whether this spending would be great enough to create sufficient employment to absorb all the men leaving the armed forces and the growing numbers of young men who would be looking for jobs, rather than going into the services.

There would also be a problem, the report says, because the mix of skills required for the defense industries differs from the skills needed in the non-defense sector. This situation could be eased, the report advises, by siphoning more men into appropriate training programs, but it emphasizes that the best hedge against joblessness is a "dynamic economy."

The report concentrates on predicting manpower needs to fulfill national goals in 16 areas, ranging from agriculture to urban development. It says that the available manpower pool in 1975 will not be large enough to achieve objectives in all these areas—thus, it predicts an overall manpower shortage.

At the same time, it concludes that limiting the extent of the shortage depends on the compatability of education and job training for the supply of workers with the expected demand for new skills. Manpower shortages and unemployment can exist side by side, the report says.

Called Manpower Needs for National Goals in the 1970's, the full report has been published commercially by Frederick A. Praeger.

NEW YORK TIMES MAR 3

POPULATION TREND REVERSED IN SOUTH

WASHINGTON — Migration into some southern States during the 1960's has resulted in a reversal for the South, as a whole, of its traditional position as a region of population out-migration, the United States Department of Commerce's Bureau of the Census finds. Simultaneously, the bureau reports, losses because of migration from the North Central States have increased.

During the first 7¼ years of the present decade, the South has gained a million people by in-migration, while the North-Central states have lost nearly a million through net out-migration, according to estimates, by the bureau. The South's net gain in the 1960's is a dramatic reversal of the 1950-60 pattern, when it lost more than a million people by out-migration. During the first half of the 1950's, when the net loss was 1.7 million, during 1955-60, the South registered a small net gain.

On the other hand, the North-Central states began to show a net loss because of out-migration during the second half of the 1950's, and the pattern has continued into the 1960's.

Over all, the population of the North-Central states has continued to climb during the 1960's. The 1960-67 increase was estimated to be 3.6 million people, a total that resulted from 8.2 million births, 3.8 million deaths, and the previously mentioned loss of nearly a million because to net out-migration.

JOB AID REVISIONS SOUGHT BY SHULTZ

He Wants Financing of All Plans Under a Lump Sum

By JOHN HERBERS
Special to The New York Times

WASHINGTON, Feb. 28 — Secretary of Labor George P. Shultz plans to submit legislation to Congress to change drastically the Administration and funding of the Federal manpower training programs to achieve greater flexibility and local control.

There are now about a dozen manpower programs costing $2.5-billion a year, funded separately by Congress and administered by various agencies.

Under Mr. Schultz's plan all of the programs would be funded together. States and local governments would be given a lump sum of money for manpower training, and they would then be able to use the programs in whatever combination needed to achieve the desired result.

This is in line with the new Administration's intention to decentralize Federal services and improve the "delivery system."

Nixon Seeks Coordination

In his message to Congress last week regarding reorganization of the Office of Economic Opportunity, President Nixon said:

"One of the priority aims of the new Administration is the development by the Department of Labor of a comprehensive manpower program, designed to make centrally available to the unemployed and the underemployed a full range of Federal job training and placement services. Toward this end, it is essential that Federal manpower programs be integrated and coordinated."

Secretary Schultz disclosed some details of his plan last night in an address before the National Governors Conference.

"Fixed sums would not be specified for the Neighborhood Youth Corps. Operation Mainstream, New Careers, Work Incentive Program, or programs under the Manpower Development and Training Act." he said. "Rather, a lump sum conceivably could be made available which would be deployed flexibly to meet the most urgent local needs for service rather than to meet nationally conceived program goals."

Included under the package would be the human development programs outside the Labor Department such as vocational rehabilitation, vocational education, adult basic education and Indian training.

Bigger Local Role

Mr. Nixon has made it clear that the Labor Department will be responsible for overseeing the administration of the programs. And Mr. Shultz told the Governors that the role of local and state officials must be strengthened in the manpower training area.

A Labor Department spokesman said that no date had been set for submission of the legislation, and various officials are being consulted regarding the form it will take.

Mr. Shultz's plan is in line with the recommendations of the National Manpower Policy Task Force, composed of manpower economists from universities and of which Mr. Schultz was formerly a member.

The task force said in a recent report that the present programs had been created "piecemeal" to meet a separate need but should now be coordinated "to allow states and communities to plan and implement their programs according to their own needs."

At least eight Federal agencies are involved, and the programs vary widely in size and purpose. Vocational education, for example, is administered by the Office of Education and has an annual appropriation of $296 million. New Careers is administered by the Labor Department. trains disadvantaged adults and has an appropriation of $36-million.

In his message to Congress last week, President Nixon directed that the Job Corps, which runs work camps for disadvantaged youths and is budgeted at $285-million, be transferred from the Office of Economic Opportunity to the Labor Department effective July 1.

WASHINGTON POST MAR 2

SS Disability Easing Sought

Sens. Birch Bayh (D-Ind.) and Lee Metcalf (D-Mont.) called yesterday for a looser definition of disability under the Social Security laws.

In a joint statement, Bayh and Metcalf said they had introduced a bill to make a person eligible for Social Security disability benefits if he cannot find a job because of chronic poor health or injury. The old definition, they said, makes a disabled person ineligible for benefits if he could perform any job "which exists anywhere in the national economy."

WASHINGTON EVENING STAR MAR 2

John Boone

Ex-Cons Hail Group's Aims

By PHILIP SHANDLER
Star Staff Writer

The group calls itself PAAC — Positive Action Against Crime. It is an amalgam of middle-class business, professional and neigborhood groups, organized to work with, and for, ex-convicts.

Yesterday, about 20 of its members listened intently to several former prisoners as well to as District officials on a panel at All Souls' Unitarian Church, 15th and Harvard Streets NW.

They responded with applause and assurances of aid in rehabilitation.

The officials included John Staggers, a special assistant to Mayor Walter E. Washington; Allan B. Avery, newly appointed director of the Lorton Reformatory; his assistant for training, Samuel Rosser, and M. Brent Oldham, executive director of the Reconstruction and Development Corporation, which is coordinating the rebuilding of riot-town areas of the city.

The discussion was moderated by Metropolitan Police Sgt. Booker Kent, a veteran Robbery Squad officer who was praised by one of the ex-cons as the rare kind of person to whom a man leaving prison could turn to for counsel and help.

The PAAC members clearly were aware that a big need in combating crime — according to several recent studies — lies in helping to reduce recidivism, crime by repeaters.

In the District, the recidivism rate has been estimated at as high as 50 percent.

So they knew what ex-con George Hart was talking about when he described how he "made it" after a term in Lorton "only because I had a friend" in Sgt. Kent.

The group's members also gave a big hand to Virgil Keel, who was released from prison last year, when he declared:

"The President may think a few more judges can lick crime, but he hasn't talked to me yet."

Incarceration only "puts off the problem" if it doesn't include meaningful rehabilitation efforts, he said.

"Serving time doesn't help a man who went in with a weakness, Keel said.

Praising the reform effort that has followed violence and disclosures of weak administration at the city's reformatory, Keel said, "I wasn't being led to anything better (than crime) in Lorton."

Keel, who wore T-shirt, sneakers and sweat jacket, told his coat-and-tie audience of several recent social experiments.

He criticized, for example, the kind of thinking that led to the use of scrip instead of cash as an answer to the problem of busholdups.

All this did, Keel asserted, was to "drive the robbers to banks."

"Maybe the next step is to convert the U.S. monetary system to scrip," he commented.

Lorton Director Avery said that he, too, was glad that a spotlight finally was being focused on his institution. He cited the problems of overcrowding and few facilities for skills training.

Mrs. Geneva Valentine said PAAC is concentrating on establishing a center to coordinate citizen efforts at rehabilitation and job referral.

Staggers said this could be helpful—the District is developing a program for a one-to-one relationship between ex-convicts and citizen volunteers, similar to a project in Denver, Colo., he said.

But both he and Keel emphasized that several programs are underway here to which a citizen could lend assistance immediately. They cited Bonabond and EFFEC—Efforts From Former Convicts—with which Keel is working.

Keel mentioned that EFFEC, trying to help more than 300 ex-convicts, meets every Thursday night on the second floor of 3308 14th Street NW.

A question about seeking help from trade unions triggered a blast from Oldham, and a warning of not to expect too much from them. He said District officials have found the unions "rigid" on the involvement of neighborhood residents in the reconstruction of the riot-ravaged sections.

Staggers echoed the attack, declaring: "We have to be honest, we have to quit playing games. The trade unions haven't done a doggone thing in a long time."

Mrs. Valentine said another meeting would be held shortly to plan the next steps.

(US Labor Dept News) Manpower - Training (Job Corps)

Week of March 3, 1969

NIXON DELEGATES JOB CORPS
TO LABOR DEPARTMENT

WASHINGTON -- President Nixon has announced that the Job Corps will be delegated to the Department of Labor effective July 1.

The President called the move "a first step" toward better antipoverty program management.

Integration and coordination of Federal manpower programs are "essential", he said, if the Labor Department is to develop a comprehensive manpower program designed to make a full range of Federal job placement and service centrally available to the underemployed and unemployed.

President Nixon called the development of such a program "one of the priority aims of the new Administration."

The President said that the move will "add another important manpower service component" to the Department and will "make available additional training and service opportunities" to Job Corpsmen.

The step "also makes it possible to coordinate the Job Corps with other manpower services, especially vocational education, at the point of delivery," he said.

In addition, the President said he expects that "important economies" will result from the delegation of the program to the Cabinet agency.

The Labor Department already refers enrollees to the Job Corps, provides it with job market information, and helps locate Job Corpsmen in the areas of greatest opportunity.

The Departments of Interior and Agriculture will continue to have operating responsibility for Job Corps centers concerned primarily with conservation, according to the announcement.

JOB TRAINING OF BLUE-COLLAR WORKERS: IMPLICATIONS FOR VOCATIONAL GUIDANCE*

Howard Rosen
Director
Office of Manpower Research
Manpower Administration
U. S. Department of Labor

Although many of the 27.5 million blue-collar workers in our society play crucial roles in our economic development and survival, it is surprising how little is known about how many of these workers--who account for a third of the work force--get their training. 1/ This paper is primarily concerned with how many of the 10 million craftsmen among the blue-collar workers get their training and the kind of vocational guidance needed to alert our young people to the employment opportunities available among the skilled trades.

The craftsmen we will concentrate on are the carpenters and bricklayers who build our homes, the tool and die makers who make the jigs and fixtures in factories so that automobile, refrigerator, and radio parts can be mass produced cheaply and quickly, the mechanics who repair our automobiles, and the

---

1/ Blue-collar workers include craftsmen and foremen; operatives (semi-skilled workers); and nonfarm laborers.

*Presented at the American Personnel and Guidance Association Meeting, April 2, 1969, at Las Vegas, Nevada.

many other skilled workers who perform the other jobs needed to keep our complex, dynamic economy functioning.

Most of us recognize the importance of these workers--especially when they're not around when we need them the most--but we are not too familiar with their training. Part of this oversight exists because of our excessive interest in the rapidly growing professional and technical field of employment. As parents, educators, and counselors we have been concentrating on the glamour jobs and have not devoted enough of our time to the bread and butter jobs which may lack dramatic appeal but do provide satisfying employment at decent wages to millions of our fellow citizens. One observer of the educational process has explained our lack of interest in the vocationally-oriented student by noting that, "American education is designed for one basic purpose--to prepare the student for subsequent schooling....anyone who drops out of the educational stream prior to graduate school is regarded as a failure." 2/

2/ The Transition from School to Work, A report based on the Princeton Manpower Symposium, May 9-10, 1968, organized by the U.S. Department of Labor; U.S. Department of Health, Education and Welfare; National Manpower Policy Task Force; and The Woodrow Wilson School and the Industrial Relations Section, Princeton University, Princeton, N. J.

A. The Training of Craftsmen

Recent research findings about the training of craftsmen have contributed significant information which should be brought to the attention of those who provide counseling to American youths. I am specifically referring to some of the research projects sponsored by the Manpower Administration of the U.S. Department of Labor which is charged with the responsibility of developing information about the adequacy of the supply of the American labor force. 3/

Let us look at the first nationwide effort to learn about how some of our workers learn their skills. The Office of Manpower Research in the Manpower Administration asked the Bureau of Labor Statistics to conduct, in 1963, a survey of the vocational training background of workers between the ages of 22 and 64 who had completed less than 3 years of college. The purpose of this study was to establish base line information about the training of the nonprofessional segment of our labor force. 4/

3/ Manpower Development and Training Act of 1962, as amended through October 24, 1968 (42 U.S.C. et seq.) Sec. 102 (3) "The Secretary of Labor...shall appraise the adequacy of the Nation's manpower development efforts to meet foreseeable manpower needs and recommend needed adjustment...."

4/ Formal Occupational Training of Adult Workers (Washington: U.S. Department of Labor, Manpower Administration, December 1964), Manpower/Automation Research Monograph No. 2.

Only about 40 percent of the craftsmen said they had learned their current jobs through formal training, including apprenticeship. The extent of formal training varied considerably by occupation. Thus, almost 3 out of 4 compositors and typesetters and electricians had learned their trade formally. Only about a fourth of the painters and a third of the carpenters had received formal training.

If so many of the craftsmen had not learned their trade through formal training, then how did they acquire their skills? According to this study, most of them had "just picked up" the necessary skills through informal on-the-job training and by exposure to a variety of work experience.

In a more recent study being conducted for the Department of Labor of the labor market experience of young men, the author reports that only 12 percent of the young white men 14-17 years of age were enrolled in vocational and commercial curricula and 15 percent of the Negroes were in these curricula.5/ Of the 4.4 million white men 14-24 years of age with 12 or fewer years of education who were not enrolled in school in 1966, some 2.4 million had no vocational training outside regular school.

5/ Herbert S. Parnes, Robert C. Miljus, Ruth S. Spitz and Associates, Career Thresholds: A Longitudinal Study of the Educational and Labor Market Experience of Male Youth 14-24 Years of Age (Columbus, Ohio: Ohio State University, Center for Human Resources Research, Spring 1969, for the U.S. Department of Labor, Manpower Administration, Office of Manpower Research).

Of the 890,000 Negro youths in this category, about 680,000 had no vocational preparation outside regular school.

Two scholars at Northeastern University have been taking a detailed look at how tool and die makers learn their trade. 6/ This occupation was selected for close examination because these craftsmen are a relatively small but crucial group of skilled workers in our economy. The researchers first tried to discover how a selected sample of superior workers learned their trade.

No particular training path produced the most competent workers. The kind of person attracted to a program was more significant than the training paths selected. Apprenticeship is considered by many to be the traditional and best training for craftsmen; yet less than 30 percent of the men had served apprenticeships either as machinists or as tool and die makers.

6/ Morris A. Horowitz and Irwin L. Herrnstadt, "An Evaluation of the Training of Tool and Die Makers" (Boston: Northeastern University, Department of Economics, for the U.S. Department of Labor, Manpower Administration, Office of Manpower Research, in process).

Six training paths were identified as those which were followed by tool and die makers in learning their trade. They were:

Training Paths	Percent
On-the-Job Training	22.5
Vocational High School	22.3
Picked-up-the-Trade	15.5
Apprenticeship	14.3
Vocational High School Plus On-the-Job Training	11.3
Vocational High School Plus Apprenticeship	9.8
Miscellaneous	4.3

Two points should be stressed about the training of these skilled workers. First, the diversity of the training paths should be noted. No one or two paths dominated. Second, this exacting and complex trade is not picked up casually. More than 80 percent of the men had some formal training, either in school or at work. Many workers either studied or acquired on-the-job, various subjects of direct use in their work.

The three shortest paths in terms of training were:

1) Vocational high school (an average of 2.7 years)

2) On-the-job training (2.9 years)

3) Apprenticeship (3.4 years)

Only one training path, vocational high school combined with apprenticeship, scored high on most measures of effectiveness. The more systematic types of training seemed to require fewer years of working experience to become an all round tool and die maker. The "pick-up" method was, by far, the most time consuming path to become a journeyman. Informal types of training, on the other hand, seemed to accelerate the classification as a tool and die maker.

Men with apprentice training appeared to have been upgraded faster than other men. This upward mobility may have been due more to the kind of individual selected for apprentice programs, and to company promotion policies rather than to the training received.

The 400 tool and die makers in the Northeastern study emphasized that working experience was extremely important. A substantial minority of the tool and die makers had been school dropouts who managed to become expert craftsmen through various training paths.

In another study of the shortage of skilled and technical workers in Chicago and St. Louis, conducted for the Manpower Administration in mid-1965, the authors concluded that, "In none of the four industrial occupations studied is there a

single well identified route to entry." 7/ Apprenticeship and combinations of junior college, technical and vocational school training, individual courses, company training programs, and informal on-the-job training were the routes through which people entered the occupations.

The researchers studying shortage occupations reported that many employers selected workers for training from among their lesser skilled employees. Thus, the internal labor market was an important port of entry for some skilled workers. Men who were already working in the plant as semi-skilled machine tool operators were often selected by employers for training as tool and die makers. Aptitude for the work, interest, and motivation were considered by some employers as more important criteria for success than the usual requirement of a high school diploma. Employers were more inclined to lower their criteria for admittance to training for their own employees than for nonemployees.

7/ Walter Franke and Irvin Sobel, The Shortage of Skilled and Technical Workers (Urbana, Ill.: University of Illinois, Institute of Labor and Industrial Relations, June 1968, for the U.S. Department of Labor, Manpower Administration, Office of Manpower Research).

Some of the tool and die makers and employers indicated that the reputation of a training institution was important. Graduates of some schools found it very difficult to find jobs while graduates of schools with good reputations were sought out by employers and generally found it easier to secure employment.

Before turning to what we have learned about vocational guidance, or the lack of it, from these or other studies, we should get some perspective about how many young men could have profited by some good vocational guidance and training. Let us use the year 1966 as an example. In that year some 560,000 young men entered the labor force as high school graduates who were not going on to college, or dropouts who failed to complete their education.

Some of these young men had a pretty good idea where they were going. The 130,000 who had graduated from Agricultural, Technical, and Trades and Industry Courses who were "available for placement" and the 54,000 more mature young men who had completed registered and nonregistered apprenticeship training were on a directed path to employment.8/ Most of the balance of the young men entered the labor force without special training or knowledge about the world of work.

8/ Vocational Education: The Bridge Between Man and His Work, General Report of the Advisory Council on Vocational Education (Washington: U.S. Department of Health, Education, and Welfare, Office of Education, 1968).

If we take into account the graduates of technical institutes and junior colleges we probably let well over 300,000 young men pour into our labor force in 1966 with little training for employment and badly in need of vocational guidance. This explains why the unemployment rate in 1966 for young men 18 and 19 years of age was 10.2 percent while the rate for all males was 3.2 percent.

We wring our hands about the high unemployment rates of teenagers knowing full well that our institutional arrangements in regular high schools and vocational schools are not set up to prepare a large percentage of the new entrants to the labor force for the world of work. We are aware that many of our vocational schools are " dumping grounds" for the youths who cannot be educated by the regular schools.

This means that many vocational schools that are trying to do a professional job are facing an insurmountable task in trying to serve two masters at once. The time has come for us to recognize that the good vocational schools are capable of making an important contribution in developing the supply of our skilled workers. However, the only way they can really carry out this function is to separate out those students who need special treatment by developing a new institutional arrangement so that they can be taught in different schools. The time has come for school authorities

to acknowledge that some of the youngsters they are expected to teach need remedial education if they are to benefit from training at all and many of these students should only be given limited training. Those students who cannot absorb the full range of training should be provided with basic skills that will make them employable and be given the kind of orientation that will enable them to respond to the discipline required in an industrial society.

B. The Need for Vocational Guidance

Our researchers, students, workers in the trades, employers, and vocational advisory councils looking at the work experience of our youngsters all agree that we do not do an adequate job in providing professional, expert guidance for most of the vocationally-oriented youngsters. Let us document this statement.

The Northeastern University study of the training of the tool and die makers pointed out students with vocational inclinations were given little or no occupational guidance when they had to make important decisions on educational programs. The researchers stated, "...there was a strong tendency of

counselors in school to denigrate vocational education." 9/ Considerable time was wasted while youngsters floundered in school and in the labor market because of lack of sufficient occupational guidance and counseling.

The Northeastern University researchers stressed that better guidance should be provided at the junior high school level by counselors knowledgeable about the labor market and sympathetic to youngsters without high academic aspirations if our youths are to be trained for occupations where good employment opportunities exist. The tool and die makers commented that, as youngsters, the schools failed to tell them that tool and die making was a rapidly expanding trade with high wages and interesting work.

The youngsters who were interviewed in the Northeastern study indicated they received little or no counseling. Whatever counseling that was received was sporadic, passive and directed toward immediate problems. Counseling was job oriented not career oriented. The longrun was never discussed and students were not exposed to a full exploration of a variety of job possibilities, career ladders and the advantages and

---

9/ Horowitz and Herrnstadt, op.cit.

disadvantages of these jobs. They did not learn about earnings or working conditions from the counselors.

Even though some schools provided placement services, most students sought jobs on their own. The school facilities were used as a last resort. The authors concluded, "There apparently was no systematic administrative arrangement, except in the cooperative schools, by which the school kept itself informed of the employment status of its student." 10/

The examination of the shortage of skilled workers showed that, "...almost 60 percent of the tool and die makers participating in the study in Chicago and St. Louis had received no counseling." 11/ The tool and die makers had obtained information on their own initiative or had, by accident, found out about the trade. Very few of the school officials interviewed in these two cities felt that high school counseling was adequate. They complained that counselors were poorly qualified, knew little about the skilled occupations and placed too much emphasis on college careers.

10/ Ibid.

11/ Franke and Sobel, op.cit.

In looking at what workers, educators, and counselors knew about employment opportunities in shortage occupations, it became apparent there is a great need for the development of more adequate occupational information at the local level. The researchers stressed that this information must be disseminated more effectively to decisionmakers in the local labor market such as employers, workers, the unemployed, students, and vocational and other educational planners. Youngsters who are going through the process of occupational choice are in particular need of information in making curricula choices.

The Advisory Council on Vocational Education reported that only about 50 percent of the American high schools provide any form of vocational guidance. The Council called for some form of vocational guidance during a large part of a person's educational career. Work experience was identified as extremely important to vocationally-oriented youths.

The Council stated, "There is too much guidance of a clerical type, an information giving and receiving process with little concern or knowledge of the demands of occupations and the world of work." 12/

In a recent study of the potentials of vocational education, Professors Kaufman and Lewis of the Pennsylvania State University found two major weaknesses of vocational guidance and counseling in the vocational schools they studied. 13/ First, the counselors were poorly prepared in vocational areas and second, ratios of students to counselors were too high. The counselors were well prepared in guidance and guidance techniques but did not have the special preparation and knowledge of the nature of blue-collar jobs necessary for vocational counseling.

12/ Advisory Council on Vocational Education, op.cit.,p.8.

13/ Jacob J. Kaufman and Morgan V. Lewis, The Potential of Vocational Education: Observations and Conclusions based on a Study of Three Selected Cities in Pennsylvania (University Park, Pa.: Pennsylvania State University, The Institute for Research on Human Resources, May 1968).

Although most of the vocational education graduates in the Kaufman-Lewis study who recalled receiving counseling, appeared to be satisfied with the guidance they received, about one-half of the vocational graduates reported they had no discussions about course choices with a counselor and more than three-fourths of the graduates indicated they never discussed their job plans.

The Penn State researchers believe that youngsters with disadvantaged backgrounds are entering our schools without basic orientations toward work that have been assumed to be there in the past. Thus, the schools are being asked to give those students the training in vocational values and work habits that have been previously provided by the home. Unless the schools develop new techniques and methods they will not be able to carry out this assignment. The researchers recommended that a more comprehensive concept of guidance is necessary. They called for vocational development that begins in elementary school and provides occupational knowledge, training in decisionmaking with the opportunity to explore many job possibilities while keeping open options for future choice.

The problem of counseling rural youth is compounded because so many of them are trained in one environment which they eventually leave when they move to the cities. Some researchers have pointed out that noncollege bound youngsters being counseled in rural schools, "...do not receive much in the way of counseling services." 14/ Many of the rural youths who move to the cities do not know about the full placement services provided by the Employment Service offices.

What implications for vocational guidance flow from these recent research studies?

C. Implications and Recommendations for Vocational Guidance

1. Those concerned with providing vocational guidance for noncollege bound youngsters should be aware of the employment opportunities available in the skilled trades. This means that they should learn about the number of job opportunities in the skilled occupations, the wages received, working conditions, and above all, the variety of training paths available for entering the craft jobs.

2. The counselor must be able to convey to the vocationally-oriented student not only the variety of paths, but must get the student to realize that these are options that can be followed even if he may have failed in school, dropped out of school,

14/ Guy H. Miles, Phase I - Optimizing the Benefits of Neighborhood Youth Corps Projects for Rural Youth (Minneapolis: North Star Research and Development Institute, 1968, for the U. S. Department of Labor, Manpower Administration, Office of Manpower Research).

or even been blocked from entering formal training paths by discrimination or unrealistic hiring standards. School dropouts have been able to learn the requirements of some of the most skilled jobs. They have been able to acquire the mathematical knowledge and have demonstrated their ability to conceptualize and think logically in performing their jobs. We know that some employers are now willing to forget about credentials if the job applicant demonstrates aptitude and desire to learn a trade. Although combinations of formal training paths may be the most efficient way to learn a trade, the "pick-up" method has been used effectively by a significant proportion of the skilled labor force.

3. Counselors should become aware of the reputation of both public and private vocational schools. They should advise students, wherever possible, to check the reputations of schools with employers or workers already in the occupation.

4. Vocationally-oriented youngsters need the same kind of career counseling as the college bound person. Emphasis on job placement alone, rather than consideration of the career can result in floundering and detours which may affect earnings and eventual success. This calls for a thorough knowledge by counselors of career patterns in craft jobs.

5. Better local, as well as national labor market information must be provided in a systematic fashion to students, employers, educators, and parents. Better ways of disseminating this information must be devised if it is to help those who are making decisions about careers and educational planning.

6. Vocational guidance should be introduced early in the school curriculum for the vocationally-oriented youngsters. This should be offered on a continuing basis throughout the educational process.

7. More work-study opportunities should be provided for vocationally-oriented young men. They should be exposed to a variety of work experiences and be permitted to explore a wide range of occupations.

8. Counselors must not concentrate on the college bound youngsters nor denigrate the blue-collar jobs in our society. Our society cannot remain democratic if it fails to recognize and respect the importance and contribution of all of its workers.

At GM training center, instructor Frank Matthews (third from right) explains the mechanics of a truck engine to GIs.

LABOR

M — Training

How GM helps itself by helping the GIs

GM dealers need mechanics, men due to leave the services need job skills. Result is training program Pentagon hopes will become a model for more companies

A General Motors project to train servicemen in a civilian skill—and to help GM auto and appliance dealers get the mechanics they desperately want—is helping to provide a model for U.S. industry. The nation, says the Pentagon, must have a broad-gauge program of corporate-sponsored, pre-separation training for the growing stream of Vietnam veterans heading for civilian jobs.

Project Transition, begun by the Defense Dept. in 1967 and conducted by a list of blue-chip companies that includes Ford, Sears, Montgomery Ward, Standard Oil of New Jersey, Mobil Oil, Dictaphone, and others, aims directly at the soon-to-be-released serviceman. Its primary target is the less skilled and less educated man who, unless he gets vocational training, runs a serious risk of joining the hard-core unemployed. Under Project Transition, the company trains him in a skill he can use in civilian life while the Defense Dept. is still paying his salary, board, and lodging.

As it works out for GM—which trained 1,000 servicemen last year and expects to train 1,200 this year—the program is a functional combination of patriotism and corporate self-help.

Shortage. According to the National Automobile Dealers Assn., franchised dealers of all auto manufacturers now have 200,000 mechanics—and need just double that number to provide adequate service to car owners. Independent garages, used car dealers, and service stations need another 620,000 (again, the number they have now), NADA estimates. That adds up to 820,000 jobs that need filling.

Of the 1,000 servicemen trained by GM last year without charge, about half wound up actually working as mechanics, most of them at GM dealers—a good enough record to justify this year's increase in trainees, the company figures.

Nothing in the Project Transition contract requires GM to offer a trainee a job or requires the trainee to accept it. But, with mechanics as scarce as they are, GM is prepared to offer any successful graduate a job in just about any city he fancies.

"I've never seen a better group of students," says Paul E. McDonald, who manages GM's 30 training centers. "They are mature and know what they want to do. They are so highly disciplined in contrast to the 18-year-olds just out of school that it's unbelievable. They absorb everything quickly."

Signing up. Three-quarters of the trainees are Army men, the rest Air Force, Navy, or Marines. All must be within six months of separation and have no plans to reenlist. The latter is a sticky point. Some base commanders reportedly offer less than wholehearted cooperation because they feel Project Transition cuts down reenlistments; a man may have no plans to reenlist, but change his mind if there's no job in sight.

Military staff personnel administer the required aptitude tests. The successful candidate, says GM's McDonald, usually has "good motivation and mechanical adaptability," although prior experience is not needed.

The serviceman's base also provides

..Now the very same pushbutton reservation system is available to every business office.

It's called Telemax.

The entire travel industry is being revolutionized—thanks to the pushbutton reservation system called Telemax. In a matter of seconds, a reservation is made and a written confirmation produced. And all you do is push a button. The button is located on a desk-top Telemax unit that any secretary can use. The unit is linked to two Telemax computers in New Jersey. To make a reservation, you simply feed in the name of the traveller, name of the motor hotel, type of accommodations, date of arrival. (Of course, Telemax does the same for hotels, airlines, car rental agencies, travel agents and commercial firms.) Push the button and you have a printed confirmation. It's quick, exact, computerized and goof-proof. Saves time, money and headaches. Gives you corporate control over travel expenses. And costs only $92 a month. If you'd like to tie-in to the nationwide Telemax travel reservation network, call our President, Kenneth F. Wright, (212) 247-3680. Call collect.

transportation to the nearby GM training center, where company personnel take over as instructors. The 240-hour course is usually sliced up into six weeks of eight-hour days and five-day weeks, or sometimes 12 weeks of half-days. The decision is the base commander's, and he may insist that the serviceman spend at least half his day on military duty. GM won't accept less than a half-day trainee. "There is too much inertia involved," McDonald says.

Eager dealers. GM finds a potential employer in the trainee's area of choice right at the start, so that the serviceman knows the specific job that's waiting for him long before he's equipped to fill it. If the dealer is located near the training center, the trainee may meet him personally—a procedure GM regards as ideal, since it reduces the chance of a switch to a competing employer. Every such switch costs GM $1,000, the expense of training a serviceman.

GI student gets individual explanation of Cadillac engine component.

Training consists mainly of "hands on practice" in work areas that resemble dealers' service areas; only 20% of the course is classwork.

The company prefers to recruit trainees as close to the end of their military duty as possible, to shrink the gap between the learning process and experience on the job. McDonald describes the typical graduate as an advanced trainee, although a few do well enough to qualify as auto mechanics. Generally, it takes a year longer to turn an advanced trainee into a full-fledged mechanic. During that time he will take additional classes at one of GM's 30 training centers; only 15 are used in Project Transition because the

others are too far from military bases.

The dealer will be grateful even for an advanced trainee, McDonald says. "If he can do 25 or 30 relatively simple operations, he frees the dealer's regular mechanic for more serious tasks," he notes. Simple operations would include seeking out short circuits in a car's complex wiring system or repairing small motors such as the one that operates windshield wipers.

The graduate starts work at $1.75 to $2.25 an hour, with prospects of increases that may lift his income to as much as $15,000 a year.

Recruiting. GM expects Project Transition plus other training programs to produce 3,700 new mechanics for its dealers this year. Ford also plans to expand its participation; in addition to training mechanics, it will also train potential auto salesmen and is considering training non-commissioned officers to become foremen at assembly plants.

McDonald—and others connected with the program—concede that there are problems. For one, the Army apparently has decided to restrict eligibility for duty-time training to the disabled and those with no civilian skills. This knocks out motor pools as sources of applicants. For another, some of the most populous bases are too far from GM centers to make training feasible.

The Defense Dept., too, feels there is room for improvement. Project Transition trained 45,000 men last year, far less than the 150,000 originally envisioned. The department's own failure to reach potential trainees was a major reason; only 280,000 of the 800,000 released from service last year were told about the transition program. The Pentagon recently hired a consultant to improve the counseling situation, especially outside metropolitan areas. It also expects to increase the number of participating bases from the current total of 250.

Hard core. The Defense Dept. also worries that the program hasn't always reached its primary target, the uneducated, unskilled man. In the first Project Transition program at Fort Knox, where men were trained as service station dealers by Humble Oil & Refining Co., all of the trainees were high school graduates. This has been the pattern more often than the Pentagon likes.

Officials say that industry's natural desire to recruit the best-qualified trainee possible is only part of the reason. Industry is showing "an ever improving attitude" on the need to waive traditional requirements in order to attract uneducated recruits, but "some of these guys are leery," says a Pentagon man. "They don't believe that industry really wants to help them." **End**

Labor's knottiest talks

Price gyrations in West Coast lumber and plywood produce the industry's most complex contract fight in years. Stiff union demands raise threat of strike by 140,000 workers

The zigzag market for West Coast plywood and lumber has made negotiations for a new three-year contract to cover the industry's 140,000 workers the most complicated and strike-prone in years.

Last year was a solidly profitable one for the industry; taken together with the first quarter of 1969, it was dizzyingly peculiar. The index grade of sanded plywood climbed from a moneymaking $76 per 1,000 sq. ft. last June to a sensational $144 in February, then started a fall that plunged it below $70 this week. This is way below the break-even point at today's soaring log and timber prices. Lumber prices followed a similar zigzag, though not as sharply.

As a result, company and union representatives came to the bargaining tables this week with two separate sets of background facts and two sets of expectations. Bargaining is getting under way on contracts due to expire June 1.

Arguments. The unions have a battery of arguments: 1968's profits; the wage lag of their members behind auto, steel, and even the pulp and paper workers employed by the same companies that employ them; and the contract pattern established earlier this month for 21,000 pulp and paper workers—75¢ over two years, or close to 9% each year, including fringe benefits. They say they want better than that in order to catch up, and they want it now.

The companies tell it another way: the money-losing days of 1967; their present tight spot; and their fears that plywood and lumber prices will drop further if tight money cuts into residential building. Management spokesmen say the companies don't deny their 1968 profits, but regard them as a windfall; they can't afford to commit themselves to lavish increases on the assumption that there will be more where those came from.

They also point to contrasts with the pulp and paper industry, which has had an unspectacular but increasingly firm market last year and this. Presumably, this stability accounts for the substantial settlements that followed strikes at 10 mills earlier this month.

Now, a plywood company executive says: "The lower the market for plywood, the harder the fight over the contract, and the more I look for a strike."

Teamwork. The two unions involved are working in harness this year as they did three years ago. They are the Lumber & Sawmill Workers, affiliated with the United Brotherhood of Carpenters, a former AFL union, and the International Woodworkers of America, a former CIO union.

Their cooperation in the 1966 negotiations—after years of warfare that weakened the bargaining positions of both—produced a 55¢ increase over three years. It was a record gain then but is now overshadowed by contracts negotiated in other industries during the intervening three years.

Their present demands call for wage boosts of 50¢ an hour the first year and 8% for each of the next two; increases in health and welfare benefits, vacations, and shift differentials; and higher job rates for certain skilled and semiskilled jobs. The unions have put no money figure on the total package, but some company spokesmen estimate its cost at 15% for each year of the three-year contract.

Travel time is also an issue, as it has been in almost every previous negotiation since loggers stopped living in bunk houses in the woods. The companies have resisted the demand for extra pay for the time spent reaching logging country—usually by private car and company bus—but their attitude is reported to be changing as logging areas grow more distant and loggers grow harder to recruit.

Table talk. The unions opened negotiations last week with the Timber Operators Council, which represents 200 independent companies, and the lumber industry's Big Four: Weyerhaeuser, Crown Zellerbach, Rayonier, and International Paper. Negotiations were due to begin this week with Simpson Timber Co., U. S. Plywood-Champion Papers, and Georgia-Pacific.

Plywood and lumber workers currently average an estimated $3.25 an hour. Fringe benefits add another 25¢ to the bill. **End**

A- Training

Sun., May 18, 1969 ST. LOUIS POST-DISPATCH

New Training Program Assures Jobs at End of Instruction

By ROBERT ADAMS
Of the Post-Dispatch Staff

For some who need jobs, going through an off-the-job training center may feel a little like rolling dice: There is no guarantee that the gamble will pay off with a paycheck.

But 10 young men who finished a course at the Employment Training Center at 4300 Goodfellow Boulevard last week avoided that gamble. Under an informal arrangement that the center had never tried before, Western Electric Co. had agreed before they began training five weeks ago to hire the 10 as telephone equipment installers.

Tomorrow they start their jobs. Whether the experiment is a success will depend on how well they do.

But the results have been so encouraging to poverty war officials than another class of 10 has been started.

Contract Trainer

"We think it's worked well for everybody," commented William F. Seymour, manager of the Northern Systems Co. operation in St. Louis. The firm runs the Goodfellow center under contract with the Human Development Corporation.

"The trainee has a job waiting for him. He doesn't have to sit home even one day. And the company benefits. They know who they're getting and they know their new employes want to work for them."

Those involved in the program note that the idea of getting a commitment for a job is not new. Under federal manpower programs, a company can sign a contract to hire a certain number of the hard-core unemployed.

Then the company trains them and is reimbursed for expenses.

But such programs, antipoverty officials contend, are not always popular with employers. Northern Systems is attempting to combine the best features of all the programs.

"We've found that some companies aren't anxious to put their names on a dotted line even if reimbursed," a spokesman for HDC said. "They may be hesitant about hooking up with the Government. Or they think we're trying to beat them into something.

"The commitment here was essentially a moral commitment. Nobody waved any papers in their faces. It seems to be an arrangement in which all sides can feel uncomfortable."

No Uncertainty

And although Northern now claims a placement rate approaching 100 per cent, the arrangement removes uncertainty and any waiting after training is done.

It also ensures that basic training is done off the job, which many feel is less threatening than an on-the-job situation.

"We hired 10 hard-core unemployed in an on-the-job training program earlier this year," noted John A. Weiss, personnel investigator for Western Electric.

"We kept only four of the 10. That's a 60 per cent dropout rate. We felt we'd better try something else."

What Western did was agree in advance to hire 10 hard-core trainees from the center. The agreement was worked out between Western Electric, Northern Systems, and Work Opportunities Unlimited, the job-placement arm of the local poverty program.

Fifteen applicants were sent to Western and tested. Ten were picked. The rest were offered the regular training program.

Visits by Executives

The 10 then began a five-week program at 4300 Goodfellow. Throughout the period, Western Electric officers, with no reimbursement, dropped by to answer questions and talk.

The 10 — there were no dropouts — were graduated Friday. Tomorrow they begin at Western with a two-week training session geared to their jobs.

And if enthusiasm is any indication, they should do well.

"We have our jobs already," said Michael Williams, 18 years old. "We won't have to go hunting for one. I think this is a great idea."

"We won't be strangers when we get there," said Curtis Boyd, 24. "We still have a lot to learn about Western. But we know a lot, too. We aren't going in blindfolded."

What Northern is doing has not been without its detractors. An official in a vocational education program in St. Louis believes that the idea may be impractical because few employers are likely to go along with the arrangement.

But another official in vocational education says he has used such a system for years and wonders why the Goodfellow center was so slow in trying it.

Seymour is optimistic.

"Everybody talks these days about voluntary co-operation between government and business," he says. "Well, that's what we're doing. We have 70 or 80 people training here at any given time. I hope eventually we can do this for all of them."

BRACE YOURSELF
(continued)

ultimately less restraint on inflation—than past recessions.

Further, the spread of service-type jobs suggests to many analysts that labor costs, which kept climbing briskly in most past recessions, will climb more briskly than ever in future economic setbacks.

Wage rates move in only one direction—up. The last yearly decline in hourly wages in production occurred in 1933, at the pit of the Depression. However, the rise of production wages in the past has been largely offset by the installation of labor-saving machinery that increases the hourly output, or productivity, of individual workers.

In service-type jobs, however, such labor-saving measures are much more difficult. You cannot—yet—automate a haircut. Indeed, many new services seem to require more rather than less human effort. New types of surgery often require large operating teams. (On the other hand, it's true that the trend to self-service has helped hold down labor costs in such service industries as retailing.)

Growing unionization in service occupations also will add to inflationary pressure in any future downturn, many analysts predict. Production workers traditionally have used union power to win big wage boosts. But now such service workers as teachers, nurses, sanitation men and even policemen are turning to union-stye militancy to win big pay increases—whose cost cannot readily be offset by automation.

There is at least one bright aspect to the postwar price record, some economists say. Although prices continue to climb in recessions, the early periods of most subsequent expansions are relatively inflation-free. When economic activity started to pick up after the 1957-58 slump, consumer prices remained flatter than in the recession. The same thing happened after the 1960-61 slowdown.

Economists say one reason for this pattern is that the trend of retail prices of such durable goods as appliances and furniture tends to lag behind the trend of prices at factory level. Factory prices usually decline in recessions, but many months elapse before the declines are reflected at the retail level. By then, economic recovery has frequently been under way. The growing role of services, however, leads some analysts to downgrade the significance of this price pattern in future recessions and recovery periods.

Thus many economists claim that the U.S. now faces an extra long period of sluggish business if inflation is to be licked. "A lot of people seem to think we can have a little slowdown and then the unpleasant matter of inflation will be set straight," says Bernstein-Macaulay's Mr. Bernstein. "But the record indicates that it will take a prolonged period of slow growth—maybe even of recession—to do the job."

How long? Perhaps as much as four years, Mr. Bernstein suggests.

But political observers say no Administration would ever allow such a long stretch of economic sluggishness. They admit, though, that there is but one alternative: More inflation.

Sun., May 18, 1969
ST. LOUIS POST-DISPATCH

Senator Urges Tougher Child Labor Laws

ATLANTIC CITY, N.J., May 17 (UPI)—Senator Harrison A. Williams Jr. (Dem.), New Jersey, said this week that the nation must strengthen its child labor laws to protect 228,000 children of migrant farm laborers.

In a speech at the national convention of state directors of migrant education programs, Williams said, "existing child labor laws make it difficult — and in some cases, impossible —to do a thorough job of educating migrant children."

"Most state laws are still inadequate and federal protection goes only to children under 16 during school hours," he said.

"Children who belong in school should not be allowed to drift out of the classroom and into the brutalizing life of harsh, exhausting labor — often only moments after school lessons."

Williams spoke before some 200 specialists in the education of children of migrant workers. They represent all states except Alaska, Hawaii and Rhode Island.

Williams recently introduced a bill in the Senate to prohibit the hiring of children on farms unless the child is 14 or older and has parental consent to work on a farm no more than 25 miles from home.

Washington Post Chart by Joseph P. Mastrangelo

Solid line represents average weekly pay of a private, non-farm employe in terms of 1957-59 dollars and after deductions for income taxes and Social Security. It shows purchasing power rose steadily until 1965, then flattened out into a plateau unbroken since then except for a short-lived rise last year. The other two lines give the reason why. The accelerating rise in the Consumer Price index (as well as taxes, which are not shown) gradually offset the increase in gross weekly earnings. Prices have been rising faster than wages so that purchasing power has steadily dropped.

Cost of Living Continues to Rise; Inflation Fighters Are Disheartened

PRICES, From A1

Assistant Commissioner of Labor Statistics Arnold Chase listed a number of areas where prices have held relatively steady in the past 12 months. Floor coverings rose only 1.6 per cent in the period; gas and electric rates, 1.6; appliances, 1.4; soaps and detergents, 1.9; new cars, 1.6, and drugs and prescriptions, 0.8 per cent. Fruits and vegetables as well as radio and TV sets were even down a bit.

"In those areas where there seems to be strong competition, prices have been held in check," Chase said.

Larger than average increases from a year ago include 5.8 per cent for restaurant meals; 6.6 for housing 10.6 for home ownership; 6.1 for clothing and upkeep; 7.5 for public transportation and 8.4 per cent for medical services.

Ironically, the biggest single inflationary increase—24 per cent in home mortgage costs—stems directly from the Government's own battle against inflation. Monetary policy has continued to force up interest rates.

For April alone, large increases appeared in services (0.8 per cent); medical care (0.7); food in general (0.7); meats, poultry and fish in particular (1.6); clothing (0.6); and gas and electricity (0.5).

U.S. HELPS STUDENTS TO WORK FOR TUITION

WASHINGTON—The Federal Government will make more than $78.8-million available during the last six months of this year to help 221,000 students work their way through college.

Divided into two awards, the money will be used in the July-December period to provide part-time employment for students under the College Work-Study program.

The first award, grants funds totaling $75,744,315 to 1,842 colleges and universities planning to continue their participation in the program. These institutions are situated in all 50 States, the District of Columbia, Guam, Puerto Rico and the Virgin Islands, and will provide jobs for 211,000 students.

The second award involves grants of more than $3-million to 300 colleges and universities taking part in the program for the first time

The Federal Government pays 80 per cent of the salaries of College Work-Study students, many of whom are from low-income families. Employment may be on campus in libraries, laboratories, college business offices, cafeterias, or in maintenance work—any job that advances the purposes of the college—or off campus with public or private nonprofit agencies in such areas as health, welfare, education, and recreation.

Two-Year Program Of Nurse Training

The DePaul Hospital School of Nursing will begin a two-year nurses' training program next fall. Students currently train for three years before receiving degrees.

The new program is designed to help meet a severe shortage of nurses.

Sister Marie Doerr, director of the school, said new teaching methods would be used to provide an accelerated program without sacrificing quality.

Survey Finds Consumers More Hopeful Than in '68

By a WALL STREET JOURNAL *Staff Reporter*

NEW YORK—Consumers are cheerier than a year ago about prospects of boosting their income and for a better business climate over the next six months, a survey of the National Industrial Conference Board shows.

According to the survey taken in March and April, 34% expect higher incomes within the next half year, up from 29% with such hopes in the spring of 1968. Also, 41% look for "good" business conditions within the next six months, up from 39% with similar expectations a year earlier.

The survey of 10,000 families in more than 200 major U.S. cities was made for the board by National Family Opinion Inc., a Toledo, Ohio, market research firm.

Specifically, it shows that 10% of the households interviewed plan to buy an automobile in the next six months, up from 9% with the same plans a year ago. Those with home-buying plans rose to 3.3% from 2.7% in the spring of 1968. And about 40% of the households plan to purchase a major appliance, up from 35% a year earlier, the survey shows.

Some Inmates in Chicago Go Out to Work Each Day

CHICAGO (AP)—Some inmates of the Bridewell, the Chicago city jail, are put on a work-release program that allows them to keep their jobs while serving sentences.

The men are housed in a cell block separate from other inmates and come and go by a separate entrance. They are not required to wear prison clothing.

They are required to sign papers releasing their salaries to their wives or families and must pay $3.50 a day to the Bridewell for room and board.

parents. Like for insist [sic], last Christmas I had enough money to buy my mother a coat which she was much in need of."

Carlotta wrote: "When you are out in the world working you feel more grown up. You feel like you are somebody. Making the money, you don't have to ask anyone to give you anything. You really have become a young lady."

Unsigned: "It's really a great opportunity. Ever since I've been in co-op I've made quite a change, not only in making money but in appearance and really in manners. You learn to speak in a different way with business people."

Not everybody was as enthusiastic as the majority. Inez wasn't. Asked, "What do you like about the job?" she answered, "What I like about the job is not much. My job is okay, but I'm sure I can get paid more for wat [sic] I'm doing."

Another girl found she didn't enjoy office work and was glad the experience had shown her what it was like. She'll find herself another career, she wrote. But the great majority expressed strong approval of the program.

Even where the program succeeds, however, it raises problems. A major one is finding jobs that not only pay wages but which are of real educational value. Business naturally wants production from its employees. The school agrees it should get value for the wages it pays, but it is concerned also that the student gets a broad education while he produces.

"We've battled and battled for educational jobs," said N. T. Whiteman, principal of Patterson Cooperative High School in Dayton. He has had considerable success in his struggle.

Some employers, on the other hand, complain that school people are so eager to find jobs for their students that they are not selective enough.

Another problem is union relations. Federal labor laws determine minimum wages for children over 16 years of age on the same scale as that used for adults. The law also states that a student worker must not displace a regular full-time employee.

Unions are vigilant to see that these provisions are observed.

Perhaps the greatest problem is to reach the children most in need of high-school co-op experience. Even in New York City, with its open-enrollment policies, a small proportion of those eligible participate in the program. Mrs. Sherline estimates that in a typical high school of 4,000 enrollment only about 150 students would be "co-ops."

Coordinators see prestige reasons

Why so few? Coordinators I met in New York say it is mainly because of the poor image of vocational education. Parents want their children enrolled in college-preparatory courses for prestige reasons, whether they expect them to enter college or not. Educators think a way must be found to change prevailing attitudes toward work-experience. Co-op rarely bears a stigma when offered in colleges, and it should not in high-school circles.

Another problem exists in rural areas where jobs in business and industry are few. Children in the Southern mountains and in areas of poor farmland and abandoned mines greatly need the opportunities offered by cooperative education. But 81 percent of the opportunities for co-op school jobs are in the inner cities, reports Dr. Trudy Banta of the University of Tennessee. "Children in small towns need this experience just as much as city kids, if not more," she points out.

It is to be hoped that when funds begin to flow to the states in July, according to terms of the Vocational Amendments Act of 1968, those states which have the problem of educating disadvantaged children for useful careers will give particular attention to areas which are too poor to carry on cooperative education without government aid.

Rare Success

A Job Program That Works

By Dick Meister
Labor Correspondent

It's there in the face of a black youngster playing happily in a little playground that just yesterday was a useless vacant lot . . .

In the brisk, eager movements of a young Latin-American, just out of his teens, learning to work for the first time in his life . . .

In the surprise on the face of a tough-talking employer when he tells you, "They're making it—by God, they're making it" . . .

And, most especially, in the overwhelming enthusiasm of the white union labor leader, Bud Johnson, and the black community leader, Orville Luster.

PROGRAM

These are the signs of success: Happiness, surprise and enthusiasm over a job program for deprived minority people that actually seems to be working the way all of the thousands of job programs are supposed to work, but rarely do.

Luster, the man who runs Youth for Service and who should know, says there is nothing quite like it, anywhere.

"I mean it," he insists, waving one of those big cigars that seem as much a part of Luster as the long, thick fingers that grip them. "They're coming from all over the country to take a look."

GOAL

This is something called the Adult Work Training Program.

It started in March of last year with about $160,000 in Federal anti-poverty funds and the rarely realized goal of finding permanent jobs for those family men in the city's minority community—and there are thousands who usually draw unemployment and welfare checks, rather than pay checks.

In the first seven months, 119 men were enrolled and 81 found permanent jobs. Fifty-six are still on the job, in construction work and city government, at airlines and aboard ships, in hospitals and restaurants and in sales and office work, and none at less than $2.25 an hour.

The Government was impressed enough to put $252,000 more into the program for another year's operation. Today, half way through the second year, 60 more men have been found jobs, about 75 are enrolled in the program and spots for 125 more are being readied.

DIFFERENCE

Program sponsors attribute this success to the fact that their effort is different from so many other such programs. They are aimed mainly at providing training that, hopefully, will lead to jobs. But this program stresses jobs above everything.

"We're not a training program at all," explained Paul Schmidt, who directs the program out of a cluttered office at Youth for Service's McAllister street headquarters.

"Our function is to find jobs. We don't guarantee anything, but we do give a guy a chance to show he can do the work thing."

The men, that is, are not being taught a specific job skill as they are in many other programs. They are being given the chance, through coaching, to exhibit the ability to hold down one of the permanent jobs that are found by program sponsors and, while on that job, to learn the skills that go with it.

LABORERS

It's not easy. But if a man can make it through the program, said Johnson, "he's pretty sure of getting a real job. We have plenty of employers who are eager to hire a man who's willing to learn what they want him to learn."

Johnson's big Laborers Union local—at 6000 members one of the city's largest—has a lot do with the program's impressive record. Among other things, three dozen of the men who were found jobs are working out of the Laborers' hiring hall here at pay of $4.40 to $8.93 an hour.

Continued on Page 6

BEST COPY AVAILABLE

JOB PROGRAM (Continued)

The men in the program are recruited through the Adult Opportunity Centers in the city's poverty areas, referred to Youth for Service for counseling and given two weeks of orientation by the State Employment Service.

Then they are sent to city agencies or to such facilities as the University of California Hospital to work at temporary jobs for $2 an hour for 10 to 12-week periods.

TRIAL

Somethime they are sent directly to the employers who program sponsors hope will give them permanent jobs eventually. These employers need only agree to hire the men for trial periods of four to eight weeks, during which their salaries are paid through the program, then decide whether to hire them permanently.

The men attend classes in basic education eight hours a week at Youth for Service and work 32 hours on their temporary jobs as hospital aides, maintenance men, clerks and as laborers at unique construction sites that are being developed for the City's "mini-park" program.

These work sites are an important part of the program—like that vacant lot transformed into a playground for the black child in the Bayview District, and others like it in other neighborhoods where they don't have many playgrounds.

It is here and at other work sites—cleaning up public housing projects or building the impressive Centro Social Obrero in the Mission District—that the men practice the basic work habits they need desperately to find permanent jobs:

"Reporting to work on time, working well with other employees, doing work willingly and with a minimum of direction."

What if a man reports to work late? "We tell him to go home and come back tomorrow," declared Joe Vargas, the Youth for Service supervisor in charge of the Bayview District playground.

"That's the only way they're going to learn how a man earns his living," he explained the other morning as he stood closely watching two young men sprucing up the playground at Palou avenue and Phelps street.

The land is leased to the program for $1 a year by the Southern Pacific Railroad, and the old telephone poles, railroad ties and other equipment that went into the imaginative play structures were donated by S.P. and other firms.

Vargas is certain that at least half of the enrollees eventually will be sent to permanent jobs, once their basic training at the work sites is concluded.

There is more to it than just the work sites, however. Many of the men have legal problems to unsnarl—arrest records to explain, traffic tickets to pay—and perhaps health problems or the need for lunch money and transportation.

The program takes care of these things, too. "When we deliver a guy," said Johnson, "everything's behind him; the hangups are gone. We can guarantee that he's ready, willing and able—and the employers will take him."

Jobs Pledged For Youths

Permanent jobs for 3883 disadvantaged high school youths and summer jobs for 1927 others have been pledged in the National Alliance of Businessmen campaign here.

John Fox, chairman of the NAB in the metropolitan area, said employment pledges from business firms were being received at an encouraging rate. However the NAB goal is to place 4000 hard-core unemployed persons in regular jobs in the next 12 months. The summer job goal is 2200.

"The actual placement of 4000 hard-core unemployed in jobs will require more than 4000 pledges to compensate for fluctuations in business conditions and other variables," Fox said. The solicitation of job pledges will end June 30.

Fox said, "One of the most notable developments in the 1969 NAB campaign is the increase of about 50 per cent over last year in the number of pledges for jobs which will be implemented under Government contracts reimbursing employers for extraordinary costs incurred in training, counseling and other supportive services."

Fox, who is board chairman at Mercantile Trust Co., urged employers who could provide summer jobs for ghetto youths to call the NAB office at 231-3500, Station 841.

HOUSTON CHRONICLE

English Help Slated For Latin Tots

Austin (AP) — The Texas Educaton Agency announced Monday three programs designed to help educate children of migrant farm workers, as well as other Spanish-speaking youngsters.

More than 15,000 Texas children who have grown to early school age speaking only Spanish will be introduced to basic English this summer in 129 schools.

The preschool program is designed to give each youngster a working knowledge of the basic words he will need to begin the first grade in September.

Teachers assigned to the classes will have fluent command of English and experience in teaching children whose first language is not English.

Each child will receive at least two hours of insturction each day and 120 hours during the program.

This plan, authorized by the legislature in 1961, is financed by the minimum foundation program. All non - English-speaking children who will reach age six by Sept. 1 and who will enter the first grade are eligible.

Ten summer institutes designed to update the teaching of migrant children will be sponsored by the TEA in three universities and one education service center.

About 625 public school administrators, teachers and teacher aides will attend sessions at the University of Texas at Austin, Texas Tech in Lubbock, Texas A&I University in Kingsville and Region I Education Service Center in Edinburg.

The special summer program, which began in 1966 with two institutes for teachers only, is supported by federal funds.

JOBS GRANT BOOSTED

U. S. Awards $128,443 More for Summer Youth Program

An additional grant of $128,443 for summer jobs for disadvantaged high school age youth has been allocated to Kansas City, George P. Shultz, secretary of labor, announced yesterday.

This brings to $458,843 the total allocated to Kansas City for the Neighborhood Youth corps summer program. The latest grant will permit adding 321 new job opportunities.

A total of 336,000 jobs will be available nationally for disadvantaged high school youth this summer through the N. Y. C. programs, Shultz said.

The N. Y. C. program is part of the Comprehensive Summer Youth program co-ordinated by the President's Council on Youth, whose chairman is Vice-President Spiro T. Agnew.

The Dallas Morning News Tuesday, May 27, 1969

Schooling OK'd For Prisoners

AUSTIN—Any prison inmates without a high school diploma may attend prison schools entirely at state expense under a bill passed recently by the Legislature, Atty. Gen. Crawford Martin ruled Monday.

Education Commissioner J. W. Edgar requested the opinion on whether the State Public School Fund, which pays 80 per cent of public school costs, must be used to send inmates to prison schools.

"We answer your question in the affirmative," Martin replied. Any prison inmates, regardless of age, may attend state-supported prison schools if he is not a high school graduate, according to the new law.

Research Summaries

Monitoring manpower programs

GERALD G. SOMERS

DATA NEEDS for the monitoring and evaluation of manpower programs are qualitative as well as quantitative, and the greatest deficiencies now lie in the former rather than the latter. Quality can be improved not only through improvements in the availability and utilization of existing data, but through the acquisition of new data by means of interview surveys and experimental evaluation-research projects, as described below.

Improvements in existing operating data and in their utilization. The direct approach to the elimination of data gaps in operating forms is through the education of operating personnel. They should be instructed concerning the importance of asking the right questions.

Since it is unlikely that a program of education can be successfully applied in all manpower programs across the country, a more realistic approach might be the insistence on excellence for a carefully selected probability sample. Special efforts could be made, through instruction and surveillance, to insure that the forms were properly completed. This sample could provide benchmark data by which the reporting forms of all other programs could be evaluated. Such a compromise between the unobtainable goal of full and accurate data in all operating programs and the alternative of a continuance of present difficulties should be feasible without undue cost.

Improvements in the operating data produced by the programs themselves should be supplemented by better utilization of social security data on earnings and employment of enrollees and of selected control groups. Although we are all aware of the limitations of social security data, especially with regard to the cutoff in reported earnings, these data, when appropriately adjusted, are far superior to the earnings data now acquired through the short term and haphazard followup of manpower programs by operating personnel.

Plans are now underway to utilize social security earnings data in the ongoing evaluation of MDTA training. This is a significant departure, and it should be watched carefully with an eye to its extension to other manpower programs.

Special sample interview surveys. Federal funds must be used in connection with those from foundations and university sources to extend interview surveys among enrollees in manpower programs and appropriate control groups. Such surveys, giving careful attention to a lengthier period of followup than is customarily possible in government evaluations, would provide employment and income data for the calculation of opportunity costs as well as for comparison of benefits before and after the program. The interview surveys would also make possible an emphasis on attitudinal questions.

Experimental-research evaluation projects. Since these interview surveys come after the fact, they are still not likely to include a valid control group. The ideal control group is a group of workers identical to the enrollees, with the same outlook, ambition, and attitudes—as well as similar objective characteristics. This group can best be found among those who apply for admission to the manpower program, are accepted by the selection officials, and yet are not included.

It is probable that such an ideal control group can be found only in a deliberately constructed

This excerpt is adapted from "Data Needs for Monitoring and Evaluating Manpower Programs," by Gerald G. Somers, chairman of the Department of Economics, University of Wisconsin, presented at the annual meeting of the Industrial Relations Research Association in Chicago, December 29–30, 1968. The full paper is included in the *Proceedings of the Twenty-First Annual Winter Meeting*, available from the IRRA, Social Science Building, University of Wisconsin, Madison, Wis.

Monthly Labor Review 6-69

Monthly Labor Record

experimental manpower program—one designed wholly for a research evaluation. There is now growing emphasis on such research experiments, and it is hoped that they will spread to the evaluation of manpower policies.

Wages in textile mills

Straight-time earnings of production and related workers in cotton and man-made fiber textile mills averaged $2.06 an hour in September 1968. The mills covered by the BLS survey employed 340,200 workers in their regular textile operations.[1] Nearly all of these workers had earnings between $1.60, the Federal minimum wage for manufacturing, and $3 an hour; earnings of the middle half ranged from $1.80 to $2.28 an hour. Men accounted for nearly three-fifths of the work force and averaged $2.13 an hour. Women, mostly employed as battery hands, spinners, weavers, and yarn winders, averaged $1.96.

The $2.06 wage level was 18 percent above the $1.74 average recorded in similar studies in September 1965.[2] This rise in average earnings was largely the result of general wage increases granted annually during the 3-year period. Regionally, average hourly earnings advanced 13 percent in New England, about 19 percent in the Middle Atlantic and Southeast regions, and 25 percent in the Southwest. Table 1, based on BLS surveys in cotton and man-made fiber textile industries since 1954, indicates that the traditional wage differential between New England and the Southeast has virtually disappeared. Since September 1965, employment was up approximately 8 percent in the Southeast and Southwest regions and down by a similar percentage in both New England and the Middle Atlantic States.

In September 1968, workers in the Southeast accounted for nearly nine-tenths of the employment and averaged $2.06 an hour. Averages in the other regions were $2.07 in New England, $2.11 in the Middle Atlantic, and $1.91 in the Southwest. Earnings levels also varied by size of community, size of mill, scope of mill operation (i.e., spinning, weaving, or both operations), and type of product manufactured. Although these factors contributed to the regional variations noted above, others, including general differences in pay levels among regions, were also important.

Table 1. Wage differential between New England and Southeast regions, 1954–68

Date	Average hourly earnings in New England as a percent of Southeast averages
November 1954	112.7
August 1960	109.7
May 1963	109.9
September 1965	106.4
September 1968	100.5

Table 2. Average hourly earnings by occupation, September 1968

Occupation	Number of workers	Average hourly earnings
Battery hands	12,193	$1.84
Doffers, spinning frame	12,771	2.17
Drawing frame tenders	4,658	2.00
Inspectors, cloth machine	9,053	1.92
Loom fixers	16,252	2.72
Spinners, ring frame	24,370	2.00
Truckers, hand	10,526	1.78
Weavers	29,064	2.37
Winders, yarn	33,104	1.93

Cotton textile mills employed 201,220 production workers and manmade fiber textile mills, 138,980. Earnings of both groups averaged $2.06 an hour. In New England and the Southeast, the only regions permitting comparisons between the averages of the two groups, differences amounted to 1 cent an hour. Nationally, earnings in both sectors advanced 18 percent since the September 1965 surveys; employment, on the other hand, declined 8 percent in cotton mills compared with an increase of 38 percent in manmade fiber textile mills. Mills were classified according to the principal type of fiber used in manufacturing at the time of the survey. Modern textile machinery facilitates shifting from one fiber to another, and part of the employment changes noted between the 1965 and 1968 surveys undoubtedly reflects this versatility.

The occupations surveyed separately were selected to represent the wage levels and the types of skills and manufacturing operations in regular textile departments. Nationwide averages for a few of the occupations studied are shown in table 2.

Seven-tenths of the production workers were paid time rates, usually under formal systems providing a single rate for a given occupation. Incentive wage systems, nearly always based on individual piecework, applied to the remaining production workers. Numerically important occupations usually paid under incentive wage systems

From Monthly Labor Review June, 1969
(Bureau of Labor Statistics, U.S. Dept of Labor)

included spinning frame doffers, slubber tenders, weavers, and yarn winders.

One-sixth of the production workers covered by the survey were employed in mills with labor-management contracts covering a majority of their production workers. This is considerably below the extent of unionization in all manufacturing industries combined. Regionally, the proportions of workers in mills with labor-management contracts were: Nearly three-fifths in New England, about one-half in the Middle Atlantic, one-eighth in the Southeast, and less than one-tenth in the Southwest.

Work schedules of 48 hours a week were in effect in mills employing nearly three-fifths of the work force in the Southeast. In the other three regions, 40-hour schedules were predominant, applying to about seven-eighths of the workers in New England, seven-tenths in the Middle Atlantic region, and nearly three-fifths in the Southwest.

Slightly more than one-half of the workers were employed on late shifts. From 25 to 30 percent of the workers in each region were employed on second shifts and generally did not receive shift differential pay. The proportions of workers on third shifts ranged from about 16 percent in the Middle Atlantic region to nearly 25 percent in the Southeast. Third-shift workers usually received 5 cents an hour above day rates in the Southeast and Southwest and 7 cents an hour in New England; in the Middle Atlantic region, the most common single provision was 10 percent above day rates.

Paid holidays and paid vacations were provided to a large majority of the workers. Paid holidays, granted to nearly seven-eighths of the work force, usually amounted to 6 days or more annually in New England and the Middle Atlantic region and 4 days or less in the Southeast and Southwest. Typical plans on paid vacations, usually based on percentages of annual earnings (for this study, percentage payments were converted to an equivalent time basis) provided 1 week's pay after 1 year of service and 2 weeks' after 5 years. Provisions for 3 weeks after 15 years of service applied to less than one-tenth of the workers.

Life, hospitalization, and surgical insurance benefits, for which employers paid at least part of the cost, were available to nearly all of the workers. Other types of insurance, such as sickness and accident, basic medical, and catastrophe, covered between one-half and two-thirds of the work force.

Retirement pension plans, other than Federal social security, covered two-thirds of the workers; regionally, the approximate proportions were one-seventh in New England, one-third in the Middle Atlantic, two-thirds in the Southwest, and seven-tenths in the Southeast. Pension benefits were usually predetermined and not based on profits. Plans providing lump-sum payments at retirement applied to slightly more than one-tenth of the work force. Such plans covered one-half of the workers in New England, compared with one-eighth or less in the other regions.

The survey covered establishments employing 20 workers or more and primarily engaged in manufacturing yarn (or thread) and broadwoven fabrics (12 inches or more in width) of cotton, man-made fibers, or silk. Earnings information developed by the survey excludes premium pay for overtime and for work on weekends, holidays, and late shifts, and is not comparable with gross average hourly earnings published in the Bureau's monthly hours and earnings series. A comprehensive report on the survey is expected to be issued late this summer. An advance tabulation of national and regional data and separate releases for some States and areas are available upon request to the Bureau or any of its regional offices. □

FOOTNOTES

[1] Earnings data for an estimated 26,157 workers employed in bleaching, cloth dyeing and finishing, and fabricating departments are excluded from earnings information in this article. These workers, however, were included in developing the proportions of production workers in mills providing selected supplementary benefits.

[2] See Charles M. O'Connor, "Earnings in Synthetic Textile Mills, September 1965," and George L. Stelluto, "Earnings in Cotton Textile Mills, September 1965," *Monthly Labor Review*, July 1966, pp. 762–768.

MANPOWER

DIGEST

RICH SQUARE, N. C.: Forty-nine Families Train, Learn In Experimental-Community Setting

The sign reads "RCA-CADA Family Training Project." Behind the sign, deployed in a bleak field outside Rich Square, North Carolina, are the prefabs in which an experiment in training is being conducted. Further back, flanked by pines, are more prefabs in which the subjects of the experiment live.

Can you move entire families of poor, black people—the principle disadvantaged of Eastern North Carolina—into a prefabricated community setting and make of them social units that will function successfully when they move back into the labor market? That is the basic question the Radio Corporation of America and the Choanoke Area Development Association are attempting to answer.

The project has been fully operative only since October of last year. It operates on two levels. On the first level are basic education centers in Windsor, Enfield, Jackson, and Ahoskie. Qualified residents of the four-county CADA area (Bertie, Halifax, Hertford, and Northampton) are given training in these centers and screened either for immediate employment or for intensive training in the family center.

The family center can handle a maximum of 49 families. Families stay an average of three to six months, until they and project officials are satisfied that they are ready to leave. The men are given basic education, counseling, and skill training in either electric welding, auto mechanics, or building trades. The women are trained as homemakers. The pre-school children romp in an onsite nursery. The community is self-contained and the families in it form a neighborhood unit with their own administrative machinery. "We try to teach them not only how to work with others but how to live with each other," says Dr. Charles F. Moffett, project manager.

It is impossible to measure the success of this program with any confidence this early. Heads of household of 21 graduating families are earning an average of $2.30 an hour. But as MDC has discovered, the true test of success in manpower training programs is the

"sticking rate." How many of the RCA-CADA breadwinners will stay on the job and go on up the salary ladder?

The Rich Square program is bucking the usual battery of manpower problems, some of them statewide in nature and others local. There are insufficient jobs in the immediate area for the kinds of skills being taught. Where such skills are in demand, the major external problem suffered by manpower training programs—inadequate housing—remains to be overcome. It is not surprising that nearly half of the 21 graduating families have had to migrate to Tidewater Virginia in order to get adequate jobs and housing.

At a glance, the RCA-CADA program leaves the impression of placing heavy emphasis on traditional skills training. Basic education is of the traditional classroom-oriented kind, too, and this is not so easy to understand with proven programmed learning components readily available. It has taken a while to get sufficient counseling staff to satisfy project officials and while the quality of the staff seems high, no structured motivational training is being offered to the trainees.

Clearly the innovation at Rich Square lies in the family training concept. This holds real promise, if it does not prove prohibitively expensive (a full-time staff of 50 is employed), and if the families can successfully make the transition from the sheltered training concept back to complex and often chaotic community life.

The Rich Square program does merit patient support. It should not be expected to perform miracles. It has gotten off to a good start. Project officials seem willing to tackle problems honestly. Prospects for the future are good.

MDC's Mobility Project is cooperating with RCA-CADA in the Rich Square experiment. RCA-CADA officials asked for and are receiving help in re-locating families to jobs in North Carolina. Some 10 families are scheduled to participate in the Mobility project, which provides counseling, housing, and jobs in job-surplus areas for clients recruited in job-scarce areas.

Two of the twenty-one Rich Square families already on the job were moved by Mobility. "We appreciate the cooperation we've had up and down the line from the Mobility staff," said Fletcher F. Lassiter, counselor-coordinator for the RCA-CADA project. "We'll probably need continued assistance from MDC-Mobility as time goes on."

"sticking rate." How many of the RCA-CADA breadwinners will stay on the job and go on up the salary ladder?

The Rich Square program is bucking the usual battery of manpower problems, some of them statewide in nature and others local. There are insufficient jobs in the immediate area for the kinds of skills being taught. Where such skills are in demand, the major external problem suffered by manpower training programs—inadequate housing—remains to be overcome. It is not surprising that nearly half of the 21 graduating families have had to migrate to Tidewater Virginia in order to get adequate jobs and housing.

At a glance, the RCA-CADA program leaves the impression of placing heavy emphasis on traditional skills training. Basic education is of the traditional classroom-oriented kind, too, and this is not so easy to understand with proven programmed learning components readily available. It has taken a while to get sufficient counseling staff to satisfy project officials and while the quality of the staff seems high, no structured motivational training is being offered to the trainees.

Clearly the innovation at Rich Square lies in the family training concept. This holds real promise, if it does not prove prohibitively expensive (a full-time staff of 50 is employed), and if the families can successfully make the transition from the sheltered training concept back to complex and often chaotic community life.

The Rich Square program does merit patient support. It should not be expected to perform miracles. It has gotten off to a good start. Project officials seem willing to tackle problems honestly. Prospects for the future are good.

Lassiter, counselor-coordinator for the RCA-CADA project. "We'll probably need continued assistance from MDC-Mobility as time goes on."

Trailer-type buildings at family training project house facilities for basic adult education and skills training for men, home management instruction for women.

The RCA-CADA Project: Partnership with the people? Or experiment in a vacuum?

One of the more interesting questions arising from the Rich Square experiment being conducted by RCA-CADA, as described in this issue of the Digest, is the extent to which the program ought to seek links with other agencies and programs in North Carolina.

The Rich Square experiment has national significance. In funding it, the Office of Economic Opportunity wants to find out to what extent the family development concept will work in rural settings like that of Eastern North Carolina. Looked at this way, the project's location in North Carolina is incidental, its need to establish meaningful contacts in the State minimal.

But no experiment in a socio-political vacuum can hope to be fully productive. The linkage between the Radio Corporation of America's staff and the four-county Choanoke Area Development Association anti-poverty agency is essential. The question is whether it is enough. Does the project need to share risks and successes as well with the people of Eastern North Carolina?

One North Carolinian deeply committed to improving the lot of the State's disadvantaged in the East recently commented wryly that it might never occur to the Radio Corporation of America's marketing people that the CADA area would be a logical spot for a parts assembly plant, for instance, simply because a source of trained labor is available there. The fact that RCA itself is training the labor is perhaps not wholly incidental.

If it is unfair to expect a large corporation to think in these terms, it is not unfair to ask what the RCA-CADA project will mean, eventually, for the people of Eastern North Carolina. Viewed from within the narrow confines of the state, it appears to be a family training program with exciting potential that so far has not established itself as a meaningful component of the manpower effort in the State.

The link with MDC's Mobility program is a valuable first step for the project. What the project officers at Rich Square need to do now is to explore other ties with North Carolina agencies and institutions—in the areas of housing and economic development for instance—with a view toward making the program meaningful for Eastern North Carolina as well as the nation.

AMERICAN AIRLINES

For Information: Robert H. Prall
(212) 867-1234

FOR IMMEDIATE RELEASE

Not all of the stewardesses of American Airlines will be spending all of their on-duty time this year on high-flying Astrojets. Some will be teaching the fundamentals of good grooming to girls in schoolrooms, auditoriums, street academies, apartment house basements, church rooms and other neighborhood meeting places in cities across the nation.

American Airlines today announced a broad expansion of a two-year-old program in which teams of specially trained stewardesses conduct courses for teen-age girls on makeup, grooming, charm, poise, attitudes and job preparation.

The youth program, one of many supported by American, is called Operation Grace and Glamour.

It is intended primarily for teen-age girls living in disadvantaged areas in cities throughout the nation. American thinks its stewardesses can be especially helpful in giving confidence to young girls in a variety of ways --by teaching them basic principles of makeup, hair styling, poise, posture, diction. The course also gives tips and suggestions on personal attitudes and how to develop self-confidence and self-respect.

-more-

C626
PRINTED IN U.S.A.

"We believe this is a practical way to encourage and help the youngsters," said C. S. Collins, vice president-public affairs for American. He continued: "The stewardesses who volunteer to work in this program are uniquely equipped by training and personal dedication. They are young enough themselves to relate easily to the teen-agers' interests and to teach them to help themselves. The success of the program in past years prompted us to make it available in many more cities."

Cooperating this year will be Carmen Cosmetics of Detroit, Mich. The firm is headed by Mrs. Carmen Murphy, the first black woman to own a major cosmetics firm. Carmen Cosmetics will be used exclusively in the grace, glamour and grooming sessions which will start Aug. 14.

Engaged in the program will be five multi-racial teams of three stewardesses each -- two based in New York, and one each in Chicago, Dallas, and Los Angeles. American Airlines coordinators in principal cities will cooperate with local organizations such as youth agencies, the Urban League, community anti-poverty groups, churches, schools and the YWCA in setting up the Grace and Glamour sessions. Each session will involve two to three hours of training for groups of 20 to 25 teen-agers.

Already highly trained in grooming and proper social graces at the American Airlines Stewardess College in Fort Worth, Tex., the stewardesses received additional training last month at Carmen Cosmetics to prepare them for teaching makeup, skin care, posture and self-help.

Mr. Collins says the advice stewardesses give is sometimes personal and spontaneous. He cited the example of a black stewardess who told her teen-age group: "Realize that you are 'somebody.' Don't use your color as a crutch, if that's the way it is. Set standards and goals for yourself and work to reach them. Stand tall. To gain confidence and success, you need to

look better and feel better about yourself. As never before, the world is an open door. Open it."

American Airlines has long been identified with youth programs. In 1966, the airline introduced the Youth Fare Plan, providing half-fare transportation on a standby basis for the 12 to 22 age group. Thousands of young people have taken advantage of the discount, traveling between home and college, and taking vacation trips.

In another program, American for four years has sponsored the American Youth Performs concerts, a nationwide series featuring youth orchestras accompanied by professional soloists. The program is climaxed each spring with a concert in Carnegie Hall in which 250 outstanding young musicians from all sections of the U.S. perform in a symphony orchestra and a chorus.

In other youth activities, American sponsors:

1. The American College Theatre Festival program, a nationwide effort which this year involved 166 colleges. The program is designed to provide a transition from the undergraduate stage to the professional stage in the field of the performing arts.

2. A Street Academy in a South Bronx (N.Y.) ghetto area intended to encourage high school dropouts to get back in to the school system and work toward a college education.

3. An Air Education program in conjunction with the Cessna Aircraft Corp. of Wichita, Kans. This program provides elementary classroom teachers with materials to develop student interest in modern day aviation.

PLANNING FOR TOTAL NEEDS: The Case of Vocational Rehabilitation in Virginia

By LEWIS BOWMAN

Viewed in short perspective, planning to meet total needs for any public policy is probably illusory if not completely utopian. In long-range perspective, however, it is the opposite approach — ad hoc and piecemeal planning — which is illusory and utopian. The reasons for this are obvious. The latter approach creates false expectations, utilizes resources haphazardly and wastefully, and offers no possibility of objectively evaluating progress or deterioration in the particular policy area.

For all its advantages, however, planning for total needs on a long-range basis is often avoided because it creates both research and planning problems. For example, in planning for total needs one is faced with the problem of establishing priorities based on objective and clearly delineated assumptions. Also, planners utilizing this approach must bring a much wider array of information to bear at every stage of the planning process. The greatest burden in using this approach, however, is the necessity of projecting trend lines and making predictive estimates. The latter burden is one planners are reluctant to incorporate in their work with any specificity. This reluctance derives, of course, from the fact that it lays them open to later criticisms and second guessing should unforeseen circumstances or assumptions based on inadequate information thwart their best efforts at estimating future total needs.

This reluctance is ill-founded. Those who exhibit this reluctance fail to appreciate, or perhaps understand, that planning is a dynamic process. Even if less than accurate estimations are made of total needs, the planner who develops such a plan has created a body of systematic information for a baseline which can then be reassessed in view of any new situation. These considerations encouraged the Governor's Study Commission on Vocational Rehabilitation to evaluate current programs and plan future programs in terms of total needs rather than in piecemeal fashion.

Objectives of the Study

The Governor's Study Commission on Vocational Rehabilitation was established in February 1967 to determine Virginia's need for vocational rehabilitation services to 1975, and to develop a comprehensive Statewide plan to meet those needs.[1] To carry out that mandate the Commission utilized surveys, testimony of experts, past caseload experience, and population projections to estimate the number of currently disabled and the number of disabled by category expected for each year through 1975. In addition, the Commission evaluated the current vocational rehabilitation programs in Virginia to identify barriers which might be blocking or delaying services. By comparing the current programs to future needs the Commission determined the additional resources which will be necessary to meet all vocational rehabilitation needs during the next six years. To encourage and to facilitate the allocation of adequate resources to meet these needs, the Commission developed a written plan in the form of recommendations. This comprehensive Statewide plan specifies the coordination and funding necessary to produce enough professional personnel, facilities, and services to fulfill the State's vocational rehabilitation goals.

Planning for Total Needs

In collecting the necessary information to plan for meeting total needs the Commission did not concentrate on any single aspect of the vocational rehabilitation programs. For example, it did not emphasize scrutiny of the administrative structures of the vocational rehabilitation agencies while neglecting the many other aspects of the total programs. Rather, the Commission contracted for surveys of a cross section of several Virginia communities, for surveys of (1) professional vocational rehabilitation personnel, (2) a cross section of vocational rehabilitation clients, and (3) of professional personnel in related programs.[2] This approach spread the information net widely enough to identify barriers and problems in the State's entire vocational rehabilitation system.

Also, by emphasizing planning for total needs, the study avoided ignoring the interrelationships of the many problems confronting all health, education, and welfare programs. The easy route, of course, would have been to investigate a few of the easily identifiable but less significant short-run problems. This does not mean that problem areas in the current programs were ignored. It means that the research suggested recommendations both for eradicating identifiable

current problems and for preventing anticipated problems.

DEVELOPING PRACTICAL PRIORITIES

In making recommendations designed to produce a vocational rehabilitation program to meet the estimated total needs, the Commission was aware that all its recommendations could not be implemented immediately as public policy. It recognized that total needs could not be met immediately on an annual basis. To structure the total plan on a practical basis, the Commission adopted a priority system for suggesting the most feasible order for implementing its recommendations. These priority categories are "action," "immediate," "soon," "interim," and "long-range" (see Table 1).

After its meeting in December 1967, the Commission issued an "Interim Report" which included recommendations to help alleviate problems in the current vocational rehabilitation programs. These are included in the final recommendations also because some of the same problems continue. Among the total recommendations these proposals from the "Interim Report" are designated in Table 1 under "action."

Among the new recommendations, those proposals which can be implemented during the first half of Fiscal Year 1969 with little additional funding or manpower are in the "immediate" priority category. Those additional recommendations which require little additional funding or manpower but may take a year or more to implement are designated by the priority category "soon."

The remaining recommendations require considerable additional funds, professional manpower, and rehabilitation facilities. This means they cannot be dealt with before the 1970 session of the Virginia General Assembly. These recommendations have been designated "interim" or "long-range" depending upon whether they can be implemented in Fiscal Years 1971 and 1972 or in Fiscal Years 1973, 1974, and 1975.

Arranging the recommendations into these priority categories produces a practical plan for phasing in enough funds, manpower, and facilities to meet the total needs for vocational rehabilitation services by 1975.

KEY PROBLEMS IDENTIFIED

The Governor's Study Commission's recommendations emphasize solving five key problems of Virginia's vocational rehabilitation programs.[3]

INADEQUATE FUNDS

The first problem is one of inadequate funds for a vocational rehabilitation program of total services. This is an obvious problem, and one not unique to this policy area. Its solution turns not on recommendations of this Commission but on the public's decisions on the amounts of services it wants and is able to provide.

COORDINATION OF SERVICES

The second problem is one of coordinating the many services available to vocational rehabilitation clients. The Commission's recommendations are designed to encourage and make effective intra-agency and interagency coordination and cooperation. To be efficient and effective the vocational rehabilitation agencies must serve as organizers of a variety of services from numerous sources for their clients.

PUBLIC INFORMATION

The third problem is the public's pervasive lack of understanding of the vocational rehabilitation programs.[4] Unfortu-

3. For a detailed listing of the individual recommendations, see *Planning for Vocational Rehabilitation in Virginia, 1968-1975*, Volume I, Final Report of the Governor's Study Commission on Vocational Rehabilitation (Richmond: Virginia Department of Vocational Rehabilitation, January 1969).

4. For information about public views of the vocational rehabilitation programs and their generalized support for the programs, see Lewis Bowman, "Views of Government and Private Involvement in Training the Handicapped in Virginia," 44 *The University of Virginia News Letter* 29-32 (April 15, 1968). Also, see Dennis Ippolito, William Donaldson, and Lewis Bowman, "Political Orientations Among Negroes and Whites," 49 *Social Science Quarterly* 548-56 (December 1968).

TABLE 1

Dimensions Considered In Establishing the Categories of Priorities

Priority Category	Time	Type of Required Change	Finances Involved	Manpower Involved
Action	In progress or completed	All types	All types	All types
Immediate (to correct current operating problems)	Within next six months (first half of FY 1969)	Administrative, within agencies organizational or procedural	Little or none (generally a change in use only)	Reassignment of duties only; no additional manpower
Soon (to set stage for program expansion)	Within one year (FY 1969)	1. Administrative, within agencies organizational or procedural	1. Only that possible within current operating budget of VR	1. Reassignment of duties mainly
		2. Administrative, outside of VR agencies	2. Other State agencies	2. Additional personnel only as permissible under operating budget
		3. Governor's Office	3. Other local agencies	
Interim (to expand in preparation for meeting all VR needs)	One to four years (FY 1969-1972)	1. Administrative, within agencies 2. Administrative, outside of VR agencies 3. Governor's Office 4. State legislation 5. Federal legislation 6. RSA changes	1. More than possible within current operating budget 2. State increase 3. Larger portion of available Federal money	1. Reassignment of duties 2. Additional personnel
Long range (to meet all VR needs)	Four to seven years (FY 1972-1975)	1. Administrative, within agencies 2. Administrative, outside of VR agencies 3. Governor's Office 4. State legislation 5. Federal legislation 6. RSA changes	1. Large amounts of additional funds 2. State 3. Federal 4. Local 5. Private	1. Reassignment of duties 2. Additional personnel 3. Establishment of sources for training large numbers of VR professional personnel

nately, this problem is not confined to the general public. It exists among personnel manning potential job placement and client referral sources as well, and inhibits client placement and casefinding.

Shortages of Manpower and Facilities

The fourth problem is one of inadequate vocational rehabilitation manpower and facilities. If amply adequate financing were available immediately for the vocational rehabilitation programs, a total program would not be possible. Many of the recommendations in this report seek to create long-range solutions to shortages in manpower and facilities.

More Help for the Severely Disabled

The fifth problem is the practice of serving the more feasible cases rather than the more severely disabled cases. Shortages of finances, manpower, and rehabilitation facilities dictated this policy in the past. As the vocational rehabilitation agencies receive substantial increases in resources, the more severely disabled will benefit correspondingly.

During the course of the study the general public, both in the public hearings and in the community surveys, continuously expressed a desire for the vocational rehabilitation program to expand its services to the severely disabled. Professional vocational rehabilitation personnel, professional personnel in related programs, and members of the Governor's Study Commission also voiced support for this program goal. The latter group has expressed a desire for funds to be provided *preferentially* for aiding the catastrophically disabled if limited allocations do not allow a program which will meet total needs.

Of course increased emphasis on helping the severely disabled will raise the risk of rehabilitation failures in individual cases. And, it will increase the demand and need for comprehensive rehabilitation facilities and for noncompetitive work situations for many of the most severe cases.

Reaching this program goal successfully will require a decided increase in funding for the vocational rehabilitation programs over the next six years. At first glance the total resources required may appear excessive. However, in the Study Commission's judgment the total costs are neither excessive nor impractical. A number of studies have shown that public money invested in rehabilitating persons vocationally reaps real and direct profits to the general public in augmented taxes, increased productivity, and removal of these rehabilitants from public welfare rolls. Of course, these direct material returns to the general public will not increase proportionately as the most severely disabled are accepted in large numbers into the client caseloads of the vocational rehabilitation agencies. But, private support is not adequate for these potential clients who are in the greatest need of vocational rehabilitation services.

TABLE 2

Estimated Additional Manpower Needs, 1968-75*

a Includes administrative, medical
b Includes aides and attendants

The Commission feels the time is ripe for the State to recognize the many nonmaterial benefits which will derive from providing services for all in need of them. It views providing an opportunity for a meaningful vocational life for all its citizens as a social obligation on the conscience of all Virginians. The Commission decided the material and nonmaterial rewards to a society adopting this total approach to vocational rehabilitation are too great to resist.

Costs of a Practical Plan

The recommendations of the Governor's Study Commission are viewed as a practical plan for meeting the needs of the vocational rehabilitation program by 1975. To implement the recommendations it is estimated that over 600 additional professional persons will have to be recruited and trained (Table 2). Also, over 700 additional aides, attendants, and service personnel will have to be added to the current vocational staffs.

The estimated funding requirements for this plan are shown in Table 3. In addition to ongoing vocational rehabilitation funding, an estimated $137,000,000 will be required. Under the current funding ratios, the State will have to provide over $40,000,000 of the $137,000,000 as its share of the necessary additional funding. For practical reasons, ongoing programs will have to be continued, and new programs will have to be phased in, hence a total of over $200,000,000 from Federal, State, and other sources probably will be necessary.

The heavy increase in the demand for rehabilitation services will prevent even the most practical and well-funded plans from solving all the State's vocational rehabilitation problems by 1975. As neat as composite plans for providing funds to implement the Commission's recommendations may appear, all will not go so regularly or well on a year-to-year basis. Difficulties in securing appropriations, in meeting the construction schedule for the needed facilities, and in providing for the additional trained personnel by the colleges and universities will probably be encountered. Crash programs to meet specific funding, facilities, and manpower shortages will be necessary. As these shortages are overcome, the added resources can be translated into services for clients. If all goes well with the implementation, the State will be in a position to start meeting all of its vocational rehabilitation needs in 1975.

A Common Problem

Vocational rehabilitation is not the only program in the State suffering from

TABLE 3

Estimated Additional Costs, 1968-75*

Year	Federal	State	Total
1968	$ 15,000	$ 180,000	$ 195,000
1969	2,151,087	1,067,884	3,218,971
1970	3,689,295	1,536,658	5,225,953
1971	17,035,327	12,202,425	29,237,752

	$93,764,125	$43,635,356	$137,399,481

* This tabulation relates to the funding requirements of the recommendations of the Governor's Study Commission only.

a lack of comprehensive planning. The absence of such planning is a common problem in many policy areas. Annual or biennial planning is the usual procedure. Of necessity, adjustments in programs must be made at relatively short intervals, but short-range planning is no substitute for comprehensive planning and is a luxury which Virginians can ill afford in any program.

For all the arguments of those who advocate "just muddling through" on an ad hoc and piecemeal basis, such an approach is no longer the answer. As the example of vocational rehabilitation in Virginia illustrates, ad hoc planning is not the type which can meet adequately the total requirements of any area of services for which Virginians have great need. Neither is it the approach calculated to reduce total costs. Visiting the problems of one generation on another can reduce, or hold in line, expenditures of the moment. In the long run, however, this approach is demonstrably more expensive in monetary and human terms. Only through systematic and comprehensive planning for all programs, and only through sincere and sacrificial efforts to implement those plans, can this generation provide an inhabitable, perhaps viable, State and Nation for coming generations.

Job Training: A Need for Seriousness

* * *

By KENNETH B. CLARK

For several years I have argued that American business is the last hope for any serious, realistic, hard-nosed attempt to change the predicament of life in American slums. I do not come to this conclusion in the conviction that the business community is more empathetic to the day-to-day problems of the slum, nor because I believe businessmen are more idealistic or morally or ethically sensitive than others.

I took this position rather because businessmen are clear about their goals. They are not bemused with moral self righteousness. They are usually unsentimental about their concern for profits and productivity. Even racial discrimination may fall victim to their single-minded search for efficiency and economic viability. Or so I believe may be possible.

If business is serious about developing training programs that are not tokens or gestures, however, it must prove by the nature of its programs and by their initial formulation and presentation, that its intent is genuine; the nature of the training must be shown to be an integral part of the jobs which allegedly exist and will be offered. Otherwise, pre-job training is not likely to be considered serious by slum youth, who are suspicious and hypersensitive and who expect that promises will not be honored.

Training that is an integral part of the job, training in which the training and the job and the remuneration are all part of the same package, can be a concrete and serious demonstration that the promise and the performance are one.

Also, the training must be real. Real training is not just job-skill training. These young people know better than anyone else that they are basically deficient in reading, arithmetic, and communication skills. Industry will not be taken seriously if it pretends that it is training a man for a job that has mobility without simultaneously addressing itself to his fundamental deficiencies. These youngsters will exploit the alleged training program as long as it is beneficial for them—and then they will get out.

Business and industry must build into industrially structured training programs remedial compensations for the inefficiency of the public schools—reading, arithmetic, oral and written communication, the major defaults of the American public schools. Academic training, job training, and jobs must be part of the total package.

Once industry accepts its responsibility to train and employ the educationally and economically deprived, it must exercise it in an emphatic, understanding way. It cannot be done sentimentally. It cannot say, "You poor disadvantaged youth, I will accept any kind of production from you. I will accept any kind of performance." Any sentimentalism will be exploited and seriousness will be eroded and rejected. Specifically, the importance of time, production standards, structured standards of performance—standards that have been found to be important in general industrial efficiency—must be clearly understood and clearly articulated and demanded.

The author, a psychologist, is president of the Metropolitan Applied Research Center Inc. A longer version of this article appeared recently in the monthly Labor Review, a publication of the U.S. Labor Department.

Industry must demonstrate its seriousness by not accepting from the Negro youngsters any lower level of academic performance than is expected from white youngsters, at the same time that it takes into account the fact that the public education of Negro youngsters has made them inferior in certain academic areas, a deficit which business can make up for by its on-the-job training.

It must demonstrate its seriousness by requiring and obtaining from the Negro youngsters precisely the same standards of manner, style, dress, punctuality, that it requires from others of whatever level of job. Seemingly compassionate programs of employment of Negroes which permit special standards for the Negro lower than those for whites are a perpetuation of racism—such double standards are interpreted by Negroes as condescension and will be exploited by them.

Those who have been neglected and deprived must understand that they are being taken seriously as human beings. They must not be regarded as peculiar human beings who cannot meet the demands more privileged human beings can meet. This is an important but subtle point.

I suspect that the significant breakdown in the efficiency of American public education came not primarily from flagrant racial bigotry and the deliberate desire to create casualties, but from good intentions, namely, the sloppy sentimentalistic good intentions of educators to reduce standards in the education of low income and minority group youngsters, to leave them in a state of amorphousness and, thereby—on the grounds that teachers should not demand of these children what they demand of suburban children—make it possible for noneducation to be alibied.

I urgently warn businesses not to follow this pattern of sentimentalism under the guise of doing good, under the guise of compensating for guilt and past injustices . . . for they will fail the slum youth's test of seriousness.

Such youngsters will accept only evidence of respect for their humanity, their capacity as human beings, their ability to learn the way people learn, their ability to perform with the same standards by which other people's performances are evaluated. And in respecting these, business will be giving not verbal, but genuine acceptance of them as human beings.

They must be provided also with realistic rewards and incentives for meeting single standards of performance and achievement. They cannot be rewarded, and believe that they are being taken seriously, for inferior standards of achievement. They will accept the same gold medal for clearly inferior work, but they will know that it is a Jim Crow medal whites would not award to whites for the same level of performance.

They must be provided with the opportunity to move upwards, but as far as I see and understand these youngsters beneath their words, they do not want to be relegated to another track. . . . Deep down, these youngsters want the opportunity and the equipment to determine the extent to which they can compete with other human beings without special gimmicks or crutches, however necessary aids may be at an interim stage.

The goals of a serious program to bring ghetto youth into business and industry cannot be attained without understanding, patience, guidance, clarity as to human requirements for genuine dignity. Whatever these are, they are not likely to be qualified by the color of skin; they are the same for all human beings. All human beings share a basic sense of their worthiness or unworthiness, a basic problem that will be settled only by constructive achievement, not by pretense.

Nature was not democratic. Human abilities were distributed along normal distribution curves. We need to accept the normal distribution curve principle with the same freedom from guilt in regard to Negroes as it now appears to operate among whites.

The ultimate test of success will come when whites and Negroes observe the range of individual differences among Negroes with the same degree of acceptance that they grant to individual differences among whites; when we will be able to note that an individual Negro is inferior in intelligence, or has questionable character, without being required to wonder, with a sense of guilt, whether his inferiority or questionable character is the result of racial oppression or is the reflection of the "fact" that all Negroes are inferior.

TENNESSEE TRAINING PROJECT MOVES UNSKILLES INTO SKILLED JOBS

WASHINGTON -- Unskilled, jobless disadvantaged persons can become skilled industrial workers in less than a year.

This is being proven in a demonstration project in Tennessee financed jointly by the U. S. Department of Labor and the Atomic Energy Commission over the last three years.

At the Oak Ridge atomic installation, nearly 1,000 unskilled persons -- jobless, underemployed, and otherwise disadvantaged -- from the surrounding community have been trained and placed in highly skilled jobs.

Training was conducted within the gates of the AEC's Y-12 plant, an industrial complex devoted to the most advanced chemical and metallurgical technology.

The trainees included a high percentage of Negroes.

Data collected on the first 700 shows that they averaged three offers of employment each, and some received as many as seven job offers.

More than 99 percent of the graduates were placed in jobs.

Their annual earnings increased by an average of almost $4,000, from poverty levels to more than $6,000 a year.

It has been estimated that the increase in Federal income taxes paid by the graduates will return their training and subsistence allowance costs to the Government in five years.

(More)

All those selected for training were persons who lacked any specialized skill which would qualify them for jobs in skilled or technical areas.

Recruitment was a function of the Tennessee Department of Employment Security. The public employment service, along with the Tennessee Division of Vocational-Technical Education, also helped with coordination and review of the program.

The program has demonstrated that:

. . . there are methods of upgrading underutilized persons in less than one year to enter skilled industrial jobs;

. . . skilled and technical workers are in critical demand by industry;

. . . there exists a new capacity for advanced skill and technical training within industry; and

. . . there are industrial, educational, and other training resources that can be more fully utilized for manpower development.

The Labor Department's participation in the project is through the Manpower Administration.

SENSE ABOUT SENSITIVITY TRAINING

School systems now infatuated with training will have to learn, as industry has, that not all sorts of training are functional for all personnel.

by MAX BIRNBAUM

During the 1960s, public education discovered the emotions. Cognitive learning and skill training, the traditional components of education, no longer satisfied the needs of a generation that had experienced the civil rights revolt, the widening generation gap, and the increasing confusion of teachers, administrators, and school board members about ends and means in education. The result was a growing interest in various approaches to affective learning that assigns to the emotional factor in education a role as important as—or, perhaps, more important than—the traditional substantive content and skills. Among these approaches the most enthusiastically embraced has been the so-called sensitivity training.

The term is used loosely to include a wide range of laboratory training approaches in human relations, group dynamics, organizational development (or, as I prefer, applied human relations training), as well as a number of verbal and non-verbal experiences that seek to increase awareness and release human potential. It is an unfortunate term because of its vagueness, but it appears that its very impreciseness and beguiling simplicity are the qualities that have helped it gain wide currency.

By whatever name it is known, however, human relations training is capable, if properly employed, of producing substantial educational change. It holds tremendous potential for improving education by dealing with its affective components, reducing the unnecessary friction between generations, and creating a revolution in instruction by helping teachers to learn how to use the classroom group for learning purposes.

The pity is that this promising innovation may be killed before its unique properties have a fair chance to demonstrate their worth. The opposition to its serious exploration is strong and is apt to grow. But it is not those who oppose sensitivity training because it smacks of therapy, which to a very small degree it does, nor even the members of the renascent John Birch Society, who would equate it with brainwashing, who pose the major challenge. Rather, the most serious threat to sensitivity training comes first from its enthusiastic but frequently unsophisticated school supporters, and second from a host of newly hatched trainers, long on enthusiasm or entrepreneurial expertise, but short on professional experience, skill, and wisdom.

What is needed today is a clearer sense of how sensitivity training developed, the varied forms it may take, and the results that can be anticipated in any given situation. Unfortunately, not all of the "experts" agree on the many issues raised by this kind of training, and there will be those who disagree strongly with many of the judgments presented here. But clearer definition of the issues, wider discussion, and more careful analysis of results should help schoolmen toward more effective use of training for fundamental improvement in the schools.

Contrary to the impression given by some recent popular writing on the subject, it was neither the author of *Joy* nor the devoted creators of Esalen who were responsible for the development of human relations training. Rather, it was Leland Bradford, then director of the Adult Education Division of the National Education Association, together with his old friends and collaborators Ronald Lippitt, now of the University of Michigan, and Kenneth Benne, now of the Boston University Human Relations Center, who were primarily responsible. Drawing on the work of the great social psychologist Kurt Lewin, they established the first training center more than two decades ago at Bethel, Maine, and founded the National Training Laboratories (NTL). And it was Bradford's tough and dogged fight against strong opposition within education that finally won sanction and support for human relations training, first from industry, then from the social and behavioral scientists, and finally from the education hierachy itself. Now, as he is about to retire as director of NTL, Lee Bradford has the satisfaction of seeing human relations training widely embraced by the education world.

As the field developed, the T-group (Training group) became the heart of any laboratory or workshop that is devoted to the study of group dynamics or human relations. The traditional T-group consists of a small group of people—ideally ten to sixteen—who meet in a residential setting (the laboratory) for approximately two weeks. Although

MAX BIRNBAUM is associate professor of human relations and director of Boston University Human Relations Laboratory.

only one part of this educational experience (theory, interpretation, and skill development are also included), the T-group is, because of its intense emotional impact, by far the most significant aspect of any human relations lab. The objectives of the T-group are to help individual participants become aware of why both they and others behave as they do in groups—or, in the jargon of the professional, become aware of the underlying behavior dynamics of the group. This is accomplished, with the help of a trainer, by creating an atmosphere in which the motivations for typical human behavior, of which individuals are often unaware, are brought to the surface in an exaggerated form. Once they are made clear and explicit, they can be discussed and analyzed. Thus, the individual participant can observe both his own behavior and that of others in the group, discover sources of different kinds of behavior, and identify the effect they have upon the functioning of the group. The effort to stimulate exaggerated behavior in order to get at the motivation behind it more explicitly is an uncomfortable experience for many people, but the feeling is usually transitory. The emotional component of the experience makes it appear to verge on therapy, but there is a significant difference between therapy that is focused on the problems of emotionally disturbed people and training that aims at the improvement of human relations skills of normal people.

In the early years of the movement, the T-group emphasis was primarily on the sociology of groups rather than on their psychology—that is, on the roles and functions of leadership and membership, rather than on the individual personality and personal development. (Bradford, Benne, and Lippitt came from adult education, philosophy, and social psychology.) The trend toward a psychological emphasis appeared in the early 1950s when the movement began to attract a larger number of people trained in clinical psychology or psychiatry. And it was at that point the T-group emerged as a new social invention that bears some rough resemblance to a combination of seminar and therapy group, but it actually is neither.

Recognition of the power of the T-group, as well as its limitations, has led to wide experimentation with other applications. Laboratory sessions of varying length and widely differing objectives have been developed, ranging from a single day or weekend to two or three weeks, and having as their purpose varying kinds of individual and organizational change. Much of the confusion in the field stems from the lack of clearly defined purposes, and guidelines that indicate the kind of training session most effective in achieving a particular objective. Most specifically, confusion results from the failure to differentiate between those training experiences that are designed to improve an individual's capacity to work effectively as a manager or member of a group for educational or re-educational purposes, and those that are designed to stimulate the individual's personal growth and so are clearly in a domain that might be labeled paratherapy, in the sense that it is parallel to therapy, rather than therapy itself. Therefore, it is necessary to look at the varying kinds of training that are becoming popular today to see what purposes each is best designed to serve.

Organizational development is a general term that includes a variety of approaches that combine affective and intellectual components in the use of small groups as a medium for consultation, problem solving, and re-education of individuals in both public and private organizations. It developed primarily out of the earlier, sociologically oriented focus of the T-group that emphasized organizational change rather than personal development. My experience with school systems and other organizations with a process that I term applied human relations training probably falls within this definition. (See Thomas Cottle's "Strategy for Change" [*SR*, Sept. 20] for a description of one application of this process to the resolution of intergroup problems in a single school system.)

Encounter groups, confrontation sessions, and *marathon labs* are usually short term—most often twenty-four-hour or weekend—experiences where the emphasis is on the direct exposure of beliefs and feelings that usually are not put on public display by individuals. The term "encounter group" derives from the phrase "basic encounter group" that Carl Rogers, the noted exponent of non-directive counseling, coined to differentiate a new kind of experience from the traditional T-group. Trainers in these sessions usually encourage participants to explore in some depth their own feelings and motivations, as well as those of other group members. The objective is to stimulate an exchange that is inhibited by a minimum of reserve and defensiveness in order to achieve a maximum of openness and honesty. Marathons differ from encounter groups primarily in the unremitting intensity of the experience that seeks to achieve a significant break-through in normal defenses and so attain what many practitioners believe is a new level of open behavior. Confrontation sessions are usually contrived racial encounters in which militant blacks literally "confront" members of the white community (teachers, police, industrial management, etc.) with their angry reaction to white racism, discrimination, and prejudice. The theoretical basis for this type of experience is that the social conditions requiring this form of learning demand a maximum dose of aggression and hostility in order to convince the targets—the whites—of the seriousness of the personal situation. (Because most confrontation sessions of this kind are not part of a plan for organizational change, they usually end as paratherapeutic experiences rather than training.)

Non-verbal exercises have invaded the training field with a vengeance in recent years. The techniques employed are numerous and range from simple exercises with a minimum of body contact to physically intimate and emotionally revealing designs of the kind most often associated with Esalen and its derivatives. (It should be noted that the explorations of Esalen, on the West Coast, are making major contributions to the field of therapy, but it is less clear how the techniques developed there can contribute to education.) Non-verbal techniques derive their theoretical justification from theories of personality that stress the possibility of achieving greater honesty and authenticity through bodily expression that can become uninhibited more quickly than can verbal communication. Thus, participants can reach deeper levels of consciousness more quickly.

Each of these varied approaches to sensitivity training is designed to serve specific purposes. Undoubtedly each can be immensely beneficial to certain individuals—and provide little help, or have negative results, for others. What

(*Continued on page* 96)

"The devilish seductivity of human relations training stems from the fact that it can reduce individual resistance to change more effectively than any other known means."

lighter side of the record

Sensitivity Anyone?

By JANE GOODSELL

Back in the days when I was a college freshman, a sadomasochistic rite often took place about 11 p.m. in the girls' dormitory. The name of the game was Truth Session. Any number could play, and anyone who refused to was relentlessly branded a poor sport (that's what cop-outs were called in those days). The rules were simple. Each girl wrote her name on a large piece of paper which was passed to the other players to write one complimentary and one critical comment about her. The objective of the game was self-improvement; by learning what other people thought of us, we could identify our faults, correct them, and re-make ourselves into better people.

My recall of these late-evening torture programs is, thank heaven, far from total. The human mind sensibly and mercifully represses memories too excruciating to remember. But I haven't forgotten how depressed I felt afterwards, once I was back in my room where I could bury my head in my pillow. I don't know which made me feel worse—the mean things I'd said about other people or the appalling things they'd said about me. We were supposed to limit ourselves to *constructive* criticism, but I'm darned if I can figure out what a person who has been chided for having too toothy a smile or not enough poise is supposed to do about it. The compliments were almost never consoling enough to balance the hurt of the criticism. "You're a real nice girl except that you're a hypocrite" was a typical example.

My roommate received the most scathing put-downs of anyone. She was a stunning blond who dated the president of the student body, so naturally all her friends considered her conceited. Actually, she was a shy, sensitive girl and so unsophisticated that she didn't even know what she'd been accused of until she looked up "nymphomaniac" in the dictionary.

These remembrances of things past came rushing back to me the other day when I happened on a newspaper article describing a new group of parlor games called "Sensitivity," "Group Therapy" and "Insight." New schmoo. Those games are just nasty old Truth Sessions fancied up with psychological trimmings, and made into marketable products by the addition of little printed cards much like those used in Uncle Wiggly type games. But these cards don't say "Forfeit one turn" or "Go back three spaces." They say things like: "Do something you normally do only in private;" or "Act out one of your anxieties." After whoever is "It" has fulfilled the instructions on his card, the other players analyze his performance for honesty, sensitivity and self-knowledge.

'Record' drawing by Marjorie Glaubach

The stated aim of these games is to help people gain insight into their emotional problems by communicating openly and honestly with others. In short, the objective is self-improvement just as it was in Truth Session.

Now don't get the idea that I'm against self improvement. Far from it. Human nature is a long way from perfect, and all of us have our faults, foibles and limitations. It's just that I don't think it's possible to effect quick psychological cures by means of gimmicky techniques and social pressure. I seriously doubt that a bunch of untrained enthusiasts can iron out each other's personality kinks in a few hours that would otherwise be devoted to a couple of rubbers of bridge.

Telling people what's wrong with them doesn't cure their problems which, in most cases, stem from deeply-buried emotions beyond their conscious control. Human character can't be manipulated from the outside, like cookie dough, to re-shape it into more acceptable form. Psychotherapy is a long and complicated process of emotional re-education which should be administered by professionals with care, caution and a trained eye for sensitive reactions. It is not an alternative to poker as after-dinner entertainment.

The only form of therapy we non-experts are qualified to give each other is the simple assurance of goodwill and friendship. When we start messing around with each other's psyches, we are playing Russian roulette with human beings.

Labor Letter

A Special News Report on People And Their Jobs in Offices, Fields and Factories

MINE WORKERS' WOES could mean trouble for the entire labor movement.

The bitter election for the UMW presidency and the murder of challenger Joseph Yablonski tend to give all unions a black eye, labor men concede. The UMW turmoil alone isn't enough to bring new laws curbing union power. But combined with widespread, lengthy strikes in the year ahead, it could create an atmosphere conducive to antiunion legislation if the GOP gains control of Congress.

Within the mine union itself, the loss of Yablonski hurts the reform movement. Lacking a widely known leader, many reformers rally around Dr. Hawey Wells, a West Virginia physician who has crusaded for improved mine health and safety. Still, a Yablonski aide says communication among reform elements has "broken down." Anonymous telephone threats to two Yablonski supporters stir uneasiness.

AFL-CIO President Meany anticipates a Congressional probe of the Yablonski slaying, with the real purpose of seeing "if there isn't a good excuse to put some new screws to labor."

* * *

LABOR LOBBYISTS face tough battles in state legislatures.

The New York State AFL-CIO braces for a grueling fight to preserve a law helping to sustain GE strikers; it allows them to collect unemployment insurance after seven weeks on the picket line. In Pennsylvania, AFL-CIO officials map resistance to any attempts to solve the state's fiscal problems by boosting the sales tax. Michigan labor men will tangle with Republican Gov. Milliken over his plans to reform the financing of public education.

Labor will take the offensive on many issues. Massachusetts union officials plan a push for legislation making workers at nonprofit institutions eligible for unemployment compensation. In New Jersey, the AFL-CIO wants a law requiring full-fledged public hearings before auto and health insurance groups can boost rates. Rhode Island labor lobbyists will seek the right to strike for public employes.

Over 30 state legislatures are slated to convene this year, though some sessions will be devoted solely to fiscal matters.

* * *

Wall St Jnl Newspaper - Tue

YOUTH CORPS gets a new look, angering anti-poverty officials.

The Labor Department reshapes the Neighborhood Youth Corps' program for high-school dropouts. Starting Feb. 1, the NYC will place greater emphasis on getting youths to return to school or take job training, less on actual work experience. Future enrollment will be limited to 16 and 17-year-olds; older youths will enter other manpower programs.

The National Association for Community Development, spokesman for hundreds of local poverty-fighting organizations, urges Labor Secretary Shultz to rescind the changes. It calls the ban on 18 to 21-year-olds "extremely unwise," contending that alternative "adult programs" don't exist in many communities. The NACD also protests the switch away from work experience in view of the "irrelevance" of school for many Youth Corpsmen.

About 31,000 youths currently participate in the NYC out-of-school program.

* * *

MACHINISTS STEP UP organizing efforts. The union creates a new organizing department under Paul Burnsky, former aide to retired Machinists boss Roy Siemiller. The department's primary task: Organizing newly built plants and "runaway" plants where local union representatives can't handle the job.

* * *

FIGHTING INFLATION: A Communications Workers of America local in Cincinnati co-sponsors with nearby Thomas More College an evening course entitled, "Getting the Most From Inflation Dollars." The union urges its stewards and their wives to attend.

* * *

DEMAND FOR ECONOMISTS slumps, according to many attending the recent New York gathering of the American Economics Association. Some economists blame the profession's poor forecasting record lately. But the Federal budget squeeze, which has slowed government hiring of young economists, is rated a more important factor.

* * *

MUSICIANS UNION starts a special program to attract young members. Aimed at the growing ranks of musicians under 21, it features lower initiation fees, special wage scales for teen dances and record hops and instruction in such matters as booking agents, managers, radio-TV appearances.

* * *

REAL ESTATE JOBS suffer from the housing slump in some areas.

The tightness of mortgage money, rapidly rising prices of homes and the slowdown in construction take their toll. "Our staff is at the lowest ebb in 25 years," says the general manager of Cleveland's R. A. Gall Realty Co.; its employment is down to about 100 from 180 a year ago. A Los Angeles realty board official reports many real estate men in the city's lower-priced housing areas are "getting part-time jobs to help out during this housing crunch."

Yet in many cities there's little evidence real estate brokers are hurting. In Atlanta, veteran salesmen at several firms count on bigger incomes in 1970. "There's so much money coming in from the North," explains one. The head of the Long Island, N.Y., Board of Realtors says brokers continue to do well, though they may have to work a bit harder now.

Some salesmen hurt by the slump find jobs in the related fields of real estate appraisal and mortgage banking.

Fragmented Effort in Federal Job Training Program Rapped

BY JACK JONES
Times Staff Writer

There was general agreement before a U.S. Senate subcommittee here Wednesday that fragmented and uncoordinated federal programs have failed to make an impressive dent in local unemployment levels.

And there were mixed feelings over whether the Nixon Administration's proposed comprehensive Manpower Training Act turning more control over to state governments is the answer.

Sens. Walter F. Mondale (D-Minn.) and Alan Cranston (D-Calif.) were the only members of the Senate subcommittee on employment, manpower and poverty who were present as two days of hearings opened in the County Patriotic Hall, 1816 S. Figueroa St.

Mondale, chairing the local hearing, made it clear he is concerned over whether the Administration bill might eliminate the voice of the poor and community action agencies in administering future state-designed manpower programs.

In some states, he commented, "governors get elected by proving they are against black people and the poor."

He indicated he also fears the proposed plan fails to provide guaranteed job opportunities after training and that there will be conflicts between governors and city mayors or local groups over control of programs.

When Gilbert L. Sheffield, director of the new California Department of Human Resources Development, supported the Administration concept and described this state's effort to coordinate training programs at the state level.

"Suppose we were in Georgia and there was a manpower problem (involving the selection of local training agencies), do you think Lester (Gov. Lester Maddox) ought to handle that?" Mondale asked.

Sheffield agreed that might be a dilemma, but he insisted that "the state has a responsibility in planning . . . although we do need to push control down to a low level."

Sheffield stressed that the current system is hampered by "detailed rules and regulations and red tape" and noted that the manuals specifying how federally funded manpower programs will be carried out "measure 19 inches in thickness with printing on both sides of each page."

This amount of federal direction, he complained, "serves to inhibit, discourage and stifle initiative and creativity in solving human problems at a local level."

But Cranston asked whether bringing the state into manpower administration between the federal government and local agencies wouldn't be "adding another level of red tape."

Contract Power

The state, countered Sheffield, "need not become a bureaucratic level." It should have power to contract for training and employment services at all levels, he said.

Mondale, openly viewing Sheffield's testimony as state reluctance to stress local control, observed that a key recommendation of the (Nixon) Administration "is for a rather dramatic deemphasis of community involvement."

Sigmund Arywitz, executive secretary of the County Federation of Labor AFL-CIO, called the Administration proposal "another case of seeming to do one thing while doing another," and he said it would add up to "gutting the manpower program."

He said labor forces are disturbed over the "paradox" in which "the federal government is seeking to increase the number of people in the job market while its economic policies are leading to more unemployment."

He observed, "We're going to have people unemployed at a higher level of skill."

The only answer, he said, is to continue expansion of the economy. He agreed with Mondale's implication that there should be a vast increase in the number of public service jobs in government.

Ernest Sprinkles, interim executive director of the Economic and Youth Opportunities Agency, criticized the lessening of community involvement and called the pending legislation "pernicious."

"Its basic thrust," he said, "is to deny the lessons learned in the war on poverty, to put us back where we were five years ago, to take away the small bit of influence that has been gained by poor people and to put it back in the hands of reactionary bureaucrats."

Spokesmen for the City and County of Los Angeles described their frustrations because of insufficient federal funds for New Careers, Neighborhood Youth Corps and other programs aimed at moving the poor and unskilled off welfare rolls.

Effort Splintered

"The current federal manpower effort," said Gordon T. Nesvig, county director of personnel, "is splintered into too many bits and pieces.

"There are so many departments and bureaus involved that very little of the money filters through to the local level. We don't even know where to go to look for it."

He noted that the county allotment of Neighborhood Youth Corps slots was cut from 1,200 in 1965 to only 199 today.

"We don't see where the proposed manpower bill is going to be of much use to us. With the emphasis on training instead of on the development of permanent jobs, we don't see much happening."

The statistics will look good, he added, "because you'll be processing a lot of people, but chances are that the trainees are not going to have jobs waiting when they reach the other end."

County Can't Pay

Herb Kaplan, Nesvig's manpower specialist, pointed out that limitations in federal funds have held down the county's New Careers program, designed to lead nonprofessional poor into professional futures in human services fields with training and formal education.

The county, Kaplan and Nesvig agreed, just can't afford to pick up the bill for all the components needed to make very many New Careerists valuable professionals.

Mayor Sam Yorty's views were presented by Rockwell Ames, executive director of the city's Office of Urban Development.

In essence, Ames said, the mayor generally approves of the proposed manpower act, but he would like to see cities with populations of 2 million or more given authority to deal directly with federal funding sources "without the state acting as an intermediary."

The state's role, said Ames on behalf of Yorty, "should be advisory."

The bill, submitted by Sen. Jacob Javits (R-N.Y.), another member of the subcommittee, calls for step-by-step decentralization of manpower programs as governors and mayors demonstrate and establish administrative capacity.

The subcommittee headed by Sen. Gaylord Nelson (D-Wis.) is holding hearings in various cities.

Speaking for the county were Ernest E. Debs, chairman of the Board of Supervisors, and Supervisor Kenneth Hahn.

Termed Overdue

Debs noted that the county has "consistently participated" in federal programs designed to upgrade the unskilled and said that many of the changes in the new plan "are long overdue."

Hahn added, "What we need to do is just overhaul the whole system." There is so much red tape at all levels "that the poor are just not being taken care of."

He pointed to the drastic growth of welfare caseloads here and said, "I am not ashamed to say I would be for a glorified WPA program for this county" to get able-bodied persons off Welfare.

After hearing from county officials that few jobs have resulted from all the programs Cranston said, "I get the feeling that the dimensions of the effort just don't touch the magnitude of the problem."

"No question about it," agreed Kaplan.

Rep. George Brown (D-Monterey Park) recited the failures of the Special Impact program here and noted that there "has been no community involvement or ownership in any of the Los Angeles plants" for which companies get federal subsidies to hire the hard-core unemployed.

Others testifying Wednesday included Irvin P. Mazzei, chairman of the Economic and Youth Opportunities Agency board; Ted Watkins, director of the Watts Labor Community Action Committee and Lawrence T. Cooper, president of the Management Council and metro director of the National Alliance of Businessmen.

Impact Program Made Few Jobs, Report Finds

Failure to Check Firms' Status Hit in Secret Study

BY RUBEN SALAZAR
Times Staff Writer

A secret Labor Department report shows that the government made little effort to check on the legal and financial status of 22 companies which were pledged $16.8 million to help the poor, it was learned Wednesday.

The report, which the Labor Department repeatedly has refused to make public, documents that although 68% of the $16.8 million federal subsidies have been granted only 1,010 of 6,720 jobs promised the poor have been filled.

Some of the contracts do not expire until next year, however.

The 42-page study, completed Oct. 25 by a Labor Department "special review staff," also states that "some of the firms in Los Angeles from the outset of their (subsidy) contracts were permitted to locate at plant sites not fully accessible by transportation to the (poverty) target areas . . ."

The government survey points out that "the general public had little opportunity to learn of the existence" of the $16.8 million Special Impact poverty program and that "there was apparently no general advertisement" of it.

The report says "contract files show a lack of adequate precontract checks on the suitability of the proposed contractor" on any of the 22 subsidy contracts.

"The contract files fail to include sufficient documentation on the legal and financial status of these contractors, and there is no indication that a pre-award, on-site survey was made on them."

It previously was revealed by The Times that the signers of an $800,000 subsidy contract to help the poor were a convicted felon—convicted of stealing government property—and a company official in trouble with the Securities and Exchange Commission.

Contract Will Be Terminated

The company, Monarch Electronics International, Inc., according to the secret report, has been notified that its subsidy contract to help the poor will be terminated.

The secret report also says that though much money has been spent under the program to help the poor, "there has been no appreciable impact on the lives of the poor in the target poverty areas" funded by the $16.8 million project.

It also says that "experience now seems to show that the Department of Labor contracted with marginal type firms who welcomed the opportunity to get venture capital and to see if an idea would work."

The payment system in Special Impact Program contracts "has created a situation where some SIP contractors have received all their funds but have done very little hiring," the report continues.

"Others have received almost three quarters of their funds and have done little in the way of hiring. These payments were based on acquisition of property and construction of a facility."

The report also shows that though the program was geared to help minority hard-core jobless the money went "to white-owned firms."

"These firms," says the report, "were allocated in either New York (9) or Los Angeles (10). Only in Cleveland and Gary, Ind., were Special Impact funds put into minority entrepreneurship ventures."

The report also shows, as has been reported, that a Los Angeles brokerage house was paid $338,000 to negotiate 12 out of 22 Special Impact programs and that the Labor Department paid a Washington, D.C., consultant firm $122,885 for "technical assistance."

"Eleven of (12) companies filed (a Labor Department statement on Contingent fees)," says the report. "Dempsey-Tegeler (the Los Angeles brokerage firm) did not have to nor did it sign these statements submitted by the companies.

"Nor did it have to file any statement concerning its receipt of commissions paid by the companies."

As for the $122,885 paid to consultants Curber Associates, Inc., of Washington, D.C., the report says that, though Curber has asked for $285,330 more, "the technical assistance contract with Curber (should) not be renewed as its services are an apparent duplication of the functions of the project's officers from the regional staffs."

As for Dempsey-Tegeler's role, through its vice president, Harold Levitt, the secret report says that:

"Because of the apparent unique role played by Dempsey - Tegeler/Levitt in the Special Impact Program and their receipt of significant commissions from Special Impact for work pertaining to the (poverty) contracts, the legality of the payment of these fees should be referred to (the government) for review.

"As an issue exists as to the extent of services provided to the contractors by Dempsey - Tegeler/Levitt, the review is all the more pertinent."

Los Angeles Times 3★ —Thurs., Jan. 8, 1970

JOB FORCE OF 100 MILLION SEEN BY 1980

Exclusive to The Times from the Chicago Daily News

WASHINGTON—The American labor force will expand to 100 million workers by 1980, a Labor Department official predicts.

Asst. Labor Secretary Jerome M. Rosow said those holding and seeking jobs a decade from now would include 36 million women and 12 million non-white persons, mostly all Negroes.

The present labor force, Rosow said, numbers 85 million.

WASHINGTON POST
JAN 16 1970

Aid to 188 Jobless Assured

A Department of Labor project known as JOBS announced this week that it has signed four contracts with Washington area employes, providing training slots for the chronically unemployed.

The employers who will provide the training at a cost to the government of more than $300,000 under the Job Opportunities in the Business Sector (JOBS) program are:

Long's Fence Co., of Hyattsville, Georgetown University, Standard Electric Co., of Kensington, and Fairmicco Inco., of Washington.

This brings to more than 2,400 the training slots arranged in the Washington area since JOBS began in June, 1968.

THE WALL STREET JOURNAL, FRIDAY, JANUARY 9, 1970

What Does a College Degree Mean?

By THOMAS J. BRAY

NEW YORK—Except for the fact that the Talent Corps stands an outside chance of rocking the educational boat, it might be dismissed as just another of the do-good outfits that are swallowed up daily by this city's agonies.

Certainly, the Talent Corps presents a familiar face. The name harks back to the optimism of the New Frontier. It is financed by the Labor Department and the Office of Economic Opportunity. Its immediate aim is to help adults in poverty-stricken areas escape dependence on welfare by training them as paraprofessional workers at schools, hospitals and other community agencies.

And, like many other social welfare organizations, the Talent Corps is staffed by the bright young wives of what ex-mayoral candidate Mario Procaccino—in a rare flash of wit—once called the limousine liberals. The founder and director, Audrey C. Cohen, is married to a prominent tax attorney and lives on Manhattan's fashionable Upper East Side.

Beneath the somewhat predictable surface, however, lies an uncommon amount of audacity. Not content with having devised a successful—if small—social welfare program, the Talent Corps is now seeking a charter as a two-year college empowered to grant the Associate of Arts degree. Even more surprising, a review panel of academic notables commissioned by the state education department to look into the matter—and, presumably, put the well-meaning but misguided do-gooders out of their misery—has recommended serious consideration of the proposal.

That doesn't necessarily mean the Talent Corps will get its charter, of course. State education staffers express grave misgivings about the proposal—even the review panel has some caveats—and the regents haven't always been noted for their willingness to go out on a limb purely in the interests of experimentation. One big question mark: Only about half of the Talent Corps students have even finished high school, much less done academic work that would qualify them for admissions to a more conventional college.

A Practical Plus

The Talent Corps is clinging stubbornly to its proposal, however. The organization's mix of academic work and on-the-job training is similar in many respects to work-study programs cropping up at colleges around the country, Talent Corps officials argue. And what its graduates lack in academic finesse, Mrs. Cohen adds, they more than make up in experience—the students range in age from 21 to 59 years old—and a practical grasp of what makes the world tick.

At the very least, the Talent Corps proposal and the report by the evaluation team seem sure to kick up some debate within the educational establishment. Once raised, the issues run deep. Do today's colleges and universities serve mainly to perpetuate an elite? Is too much emphasis placed on a lock-step system of education that makes everybody progress at the same rate—or not at all? Are the liberal arts relevant in the midst of urban chaos? Indeed, precisely what is the meaning of a college degree?

Says the Talent Corps' Mrs. Cohen: "Higher education in this country, particularly in the urban community colleges, is in danger of losing touch with reality. Everybody is so busy trying to mimic Harvard that they have forgotten about the problems in their own backyards. What we are trying to create is a means of harnessing education to the needs of the community, much as the land-grant schools did for the farmer."

Retorted State Education Commissioner Ewald B. Nyquist in a recent letter to an inquiring state assemblyman: "Our admiration for the corps *as a social enterprise* is unlimited. However, in our role as guardians of academic standards and the integrity of degrees, we are forced to admit that on educational grounds there are no existing instruments to measure the behavioral achievements that Mrs. Cohen claims for her graduates."

The latest crop of Talent Corps students numbers about 150, nearly all of them Negro or Puerto Rican. About half are on welfare and the large majority are women, many of them with large families to support.

Classes are held twice weekly at Talent Corps headquarters in a graying old Federal office building on the fringe of Greenwich Village. The other three days a week, the students are dispersed to a variety of "human service" jobs ranging from teaching assistants at city schools to legal researchers for Community Action agencies. In most cases, Talent Corps officials have had to persuade authorities to establish such paraprofessional job slots; it's hoped that the jobs will come to be viewed as entry-level positions in which students will have a chance for substantial upward mobility.

The academic curriculum, taught by a thrown-together collection of college instructors, graduate students and the Talent Corps' own staff, places heavy emphasis on the social sciences—sociology, political science, psychology, education and economics. During the first academic year (the sessions last 36 weeks) there is also a heavy dose of remedial language and math.

Much of the work is surprisingly sophisticated. Readings in a first-year unit on "Man in Society," for example, range from Rousseau's "The Social Contract" to Orwell's "Animal Farm." A second-year course on the principles of teaching include such ponderous tomes as Chall's "Learning to Read: The Great Debate," and "Revolution in Learning" by Maya Pines.

At all levels, effort is made to relate course material to the student's field work and background (in most cases, the two are linked). Thus, a second-year economics course focuses on the urban slums, including a critical look at various proposals for solving their problems; a psychology course dwells heavily on the pathology of the poor by using case problems from actual working assignments.

The students are reimbursed at the rate of about $2 an hour for school attendance. Together with the earnings from their jobs, this allows most to scrape by, although continued welfare assistance is required in many cases. The dropout rate is low—of 100 entering students a year ago, only 16 failed to complete their freshman year; most were women unable to find adequate day-care for their children. And of the 300 students who have graduated since the inception of the program, 252 are now holding down steady jobs.

The attempts of the Talent Corps to obtain a college charter date back almost two years, but until recently Mrs. Cohen and her staff had always met with a polite rebuff. After all, state officials noted, the Talent Corps failed to meet nearly all the established criteria as a college. Among them: At least $500,000 in assets ("it should be far more," says a state official), an "adequate" library, "reasonable" admissions standards and a faculty whose academic credentials are "consistent" with the rest of higher education.

The State's Position

"In essence the Talent Corps would like to have recognition for a normal academic degree, but it doesn't want to accept the normal criteria for accrediting purposes," says Charles Meinert, an official in the state bureau of college evaluation who has been following the case.

State officials haven't been entirely negative, it should be noted. The education department itself is helping the Talent Corps work out a more formal testing system—one prerequisite for a college is evidence that the "learning process" is taking place—and there is evidence that some of the rules might be bent a little to fit the circumstances.

On the fundamental question of whether Talent Corps students are doing college-level work, however, state officials profess substantial skepticism. And they question whether a college degree should necessarily be the end-product of training in the so-called human services. "Many social services haven't bothered with degrees," notes Mr. Meinert. "Embalming is one example. It's a very useful craft, and it takes lot of training, but it's not really of a collegiate nature. It doesn't require the intellectual rigor and breadth that goes into a college degree."

Talent Corps officials argue, however, that the social service jobs for which it trains its students can hardly be compared to such crafts as embalming. For one thing, it's noted, most social service organizations themselves require an academic degree for employment in "meaningful" jobs. And in any case, Talent Corps officials add, the key to the problem is upward mobility. Without a recognized degree, Talent Corps graduates will be consigned to essentially menial jobs; there would be little incentive to take their studies very seriously.

Night study and adult education courses are plentiful, of course. But Talent Corps officials assert that these don't answer the needs of their students. Most require a high school diploma, and most require students to be away from their families during the critical evening and weekend hours. Perhaps most important, none offer related jobs.

"One of the important things about the Talent Corps," says Louis Menands, an assistant provost at the Massachusetts Institute of Technology who chaired the academic team that looked into the Talent Corps request for a charter, "is that it combines study with work so that the student has a need to learn. We were extremely impressed with the quality of

[illegible] the limousine liberals. The founder and director, Audrey C. Cohen, is married to a prominent tax attorney and lives on Manhattan's fashionable Upper East Side.

Beneath the somewhat predictable surface, however, lies an uncommon amount of audacity. Not content with having devised a successful—if small—social welfare program, the Talent Corps is now seeking a charter as a two-year college empowered to grant the Associate of Arts degree. Even more surprising, a review panel of academic notables commissioned by the state education department to look into the matter—and, presumably, put the well-meaning but misguided do-gooders out of their misery—has recommended serious consideration of the proposal.

That doesn't necessarily mean the Talent Corps will get its charter, of course. State education staffers express grave misgivings about the proposal—even the review panel has some caveats—and the regents haven't always been noted for their willingness to go out on a limb purely in the interests of experimentation. One big question mark: Only about half of the Talent Corps students have even finished high school, much less done academic work that would qualify them for admissions to a more conventional college.

A Practical Plus

The Talent Corps is clinging stubbornly to its proposal, however. The organization's mix of academic work and on-the-job training is similar in many respects to work-study programs cropping up at colleges around the country, Talent Corps officials argue. And what its graduates lack in academic finesse, Mrs. Cohen adds, they more than make up in experience—the students range in age from 21 to 59 years old—and a practical grasp of what makes the world tick.

At the very least, the Talent Corps proposal and the report by the evaluation team seem sure to kick up some debate within the educational establishment. Once raised, the issues run deep. Do today's colleges and universities serve mainly to perpetuate an elite? Is too much emphasis placed on a lock-step system of education that makes everybody progress at the same rate—or not at all? Are the liberal arts relevant in the midst of urban chaos? Indeed, precisely what is the meaning of a college degree?

Says the Talent Corps' Mrs. Cohen: The latest crop of Talent Corps students numbers about 150, nearly all of them Negro or Puerto Rican. About half are on welfare and the large majority are women, many of them with large families to support.

Classes are held twice weekly at Talent Corps headquarters in a graying old Federal office building on the fringe of Greenwich Village. The other three days a week, the students are dispersed to a variety of "human service" jobs ranging from teaching assistants at city schools to legal researchers for Community Action agencies. State officials haven't been entirely negative, it should be noted. The education department itself is helping the Talent Corps work out a more formal testing system—one prerequisite for a college is evidence that the "learning process" is taking place—and there is evidence that some of the rules might be bent a little to fit the circumstances.

On the fundamental question of whether Talent Corps students are doing college-level work, however, state officials profess substantial skepticism. And they question whether a college degree should necessarily be the end-product of training in the so-called human services. "Many social services haven't bothered with degrees," notes Mr. Meinert. "Embalming is one example. It's a very useful craft, and it takes lot of training, but it's not really of a collegiate nature. It doesn't require the intellectual rigor and breadth that goes into a college degree."

Talent Corps officials argue, however, that the social service jobs for which it trains its students can hardly be compared to such crafts as embalming. For one thing, it's noted, most social service organizations themselves require an academic degree for employment in "meaningful" jobs. And in any case, Talent Corps officials add, the key to the problem is upward mobility. Without a recognized degree, Talent Corps graduates will be consigned to essentially menial jobs; there would be little incentive to take their studies very seriously.

Night study and adult education courses are plentiful, of course. But Talent Corps officials assert that these don't answer the needs of their students. Most require a high school diploma, and most require students to be away from their families during the critical evening and weekend hours. Perhaps most important, none offer related jobs.

"One of the important things about the Talent Corps," says Louis Menands, an assistant provost at the Massachusetts Institute of Technology who chaired the academic team that looked into the Talent Corps request for a charter, "is that it combines study with work so that the student has a need to learn. We were extremely impressed with the quality of effort that this helped produce."

Until the Talent Corps produces a standardized testing system, state officials say, it won't be possible to say whether the students are doing college-level work. But Talent Corps officials argue that it's impossible to measure the work of their students against the work of students at conventional colleges. For one thing, little of the work at the Talent Corps is along traditional disciplinary lines; for another, it's difficult to measure the knowledge of Talent Corps students with a testing system designed for middle class youngsters at predominantly white schools.

Terminology and Understanding

"The students here have a college-level understanding of the concepts," says Kalu Kalu, an Indian economics graduate student who was a teaching assistant at the University of California at Berkeley, "but putting it into correct terminology is a problem. When you talk of depression or recession, you don't really get a reaction. But when you talk of unemployment, it clicks. Likewise, they don't understand inflation—at least at the outset of the course—but they understand rising prices."

Should Talent Corps students receive recognition for the knowledge they have built up over the course of their lives? "If that's the argument, then you are redefining college to mean almost anything," says Mr. Meinert of the state education department. "A trip abroad, a tour in the Peace Corps—these are all educational experiences. But it's difficult to equate these things with degrees."

The dilemma the Talent Corps raises is that while Mr. Meinert's argument is persuasive, students and graduates of the Corps raise a counter-argument that's also hard to answer: That if society demands degrees as credentials for the best jobs, then the credentials ought to be available to those who can in fact perform those jobs.

Juanita Blake, a 35-year-old mother of nine who works as a caseworker at a local hospital, puts it this way: "By accident, I'm in a job slot that calls for a master's degree in social work, but I haven't had any problems. It makes you wonder if these degrees aren't a little overrated—except for the purposes of getting a job."

M— Training

MANAGEMENT

T-school for behaviorism

New 'university' will boost controversial sensitivity training

Sensitivity training, the controversial group confrontation device that tries to show an executive or other individual why he acts as he does, is getting a new boost just at the time that it is being critically reevaluated by its long-time friends. National Training Laboratories (NTL), which has zealously shaped the technique for more than 20 years, is launching what it calls "the world's first university devoted entirely to behavioral science."

The group, called the NTL Institute for Applied Behavioral Science, has staked out a 375-acre Virginia site eight miles west of Washington's Dulles Airport. Directors and friends have pledged $1-million toward a $20-million building campaign.

The first building, a conference center for about 500 persons, is expected to open in late 1971. Plans for the complex call for research and diagnostic facilities and a "Center for the Development of Educational Technology."

Curriculum. Leland P. Bradford, 64, who has masterminded NTL activities since its birth in 1947, is slated to become president. As Bradford envisions it, the "University" will be a think tank—a "model that can serve as one way to organize human behavior." NTL will continue its widely known T-group labs (T stands for training) at its summer campus in Bethel, Me., and elsewhere around the world.

In a typical lab, about 20 executives from different companies gather at a secluded retreat for a two-week session. An NTL "trainer" explains that there are no rules and no agenda. It is up to the group to decide how to proceed. In deciding, the individuals soon begin to focus on the basic raw material of a T-troup: member interreaction. By the end of the free-wheeling sessions, many have gained insights into why they act as they do in a group and how others view their actions. Some cannot stand up emotionally to such soul-baring, which has contributed to the controversy.

Bradford says NTL's new program will offer master's degrees in applied behavioral science and in humanistic psychology to those who already hold doctorates or who are taking doctorates at other universities.

The NTL move comes at a time when all sorts of persons are latching onto the T-group idea and its money-making possibilities. NTL and the some 500 psychologists, sociologists, psychiatrists, and educators affiliated with it are concerned by the mushrooming number of academic entrepreneurs and other assorted "consultants" with varying credentials who offer to conduct training labs for companies, government agencies, policemen, teachers, and churches.

Bradford says that NTL, which is associated with the National Education Assn.'s adult education division, hopes to form an organization that would admit only institutions of learning that meet carefully prescribed standards.

Different paths. At the same time, there is a growing polarization in the T-group movement. One faction views groups and their latest offspring (the so-called encounter groups, confrontation sessions, and marathon labs which may run nonstop for 48 hours or longer) as group therapy devices that primarily give individuals insights into their own behavior. San Francisco's Esalin Institute and New York's Aureon Institute have experimented with labs in which all communication is nonverbal, using mostly sight and touch.

In contrast, the approach that companies are buying tries to relate individual behavior to organizational goals—a team approach. The new catch-phrase is "organizational development" rather than "sensitivity training," explains Richard E. Byrd, an NTL member, who heads a small consulting company in Minneapolis.

"Sensitivity training calls attention to small groups of strangers confronting one another in a little room on a personal basis," says Byrd. "We're trying to transfer the value systems in sensitivity training to the organizational structure. We're work-oriented, and work with organizational issues."

Says a spokesman for Metropolitan Denver's Adult Education Council, which has sponsored T-group labs for 20 years; "Sensitivity training in itself is designed to make people more open, more honest, to understand themselves. That's fine for the individual. But unless you translate it into terms of organizational development, it's not really as useful."

This also is the approach taken in managerial grid seminars and some American Management Assn. courses. The Orizon Institute, affiliated with Johns Hopkins University's psychiatry department, plans to expose business "task forces" to hypothetical problems they later encounter as a team.

Leland Bradford envisions the center as a model for future efforts.

Paul R. Mico, president of Boston's Social Dynamics, Inc., thinks sensitivity training can help companies move from autocratic hierarchies to democratic organizations of effective teams. "Managers are consultants, not bosses," he contends. "Motivation now goes beyond money."

In-company techniques. Companies, too, are devising their own programs. TRW, Syntex, Texas Instruments, Polaroid, Federated Department Stores, Hotel Corp. of America, Corning Glass Works, General Foods, and American Airlines have blended various techniques, sometimes devising entirely new tools. Many have created special organizational development departments, known as ODs.

As NTL moves to set up its own university, other behavioral science-oriented organizations also are taking stock. A spokesman for Chicago's Stone-Brandel Center, pet project of insurance executive W. Clement Stone, observes that it has been "totally reorganized this fall." The center is housed in the former St. Luke's Hospital, and funding has been a problem.

Reflecting the pressures of an age where an enterprising entrepreneur can assemble a weekend staff from a nearby university and set up shop for dozens of clients in a motel suite, the spokesman says: "Mr. Stone simply felt he was spending a disproportionate amount of his funds on real estate."

This does not mean the end of the center, he says, but adds sadly: "Like Brigadoon, we're going into that 100-year sleep." ■

Thurs., Jan. 15, 1970 ST. LOUIS POST-DISPATCH

Project Challenge Aids Community

By Connie Rosenbaum
Of the Post-Dispatch Staff

MANY OF THE semiprofessional media technicians at Project Challenge came to their present positions from menial jobs. They worked as bar maids or sewing machine operators or hospital aids. Others had been homemakers and some had never worked at all.

Today, after an intensive training program, these women manage the care and distribution of films and media equipment for the Instructional Media Center at 2901 Bond Avenue, East St. Louis. The center's Project Challenge distributes more than 5000 films and 2000 books to students in the surrounding elementary schools, junior high schools, and high schools. This material, as well as film strips, records and recordings, is handled by a staff of 32 women technicians, one man and six professional supervisors.

Working in a renovated grocery store, the technicians make instructional materials like charts and teaching pictures, booklets and slide sets. They have written, photographed and produced four slide shows on a local department store, the Mississippi River, a farm and local black men of distinction.

THEY HAVE ALSO PROMOTED and organized a film festival for adults that is held one evening a month in different nearby Title One schools. The festival shows films on child care, health care and black history for parents.

"These women have much to share," said Mrs. Katie Wright, director of the four-year-old program. "Now they have an outlet. Project Challenge enables them to reach many students as well as learn new skills themselves."

Mrs. Ida Faulkner, mother of three young children, is an audio-visual technician at Johnson Elementary School, one of the programs surrounding satellite schools. She works with first and second graders, operating the equipment as well as assisting them with their studies.

She had experience with children when she worked as a Girl Scout troop leader and as Sunday school teacher, but she had never managed media equipment until she came to the center for training.

"NOW I REALLY BELIEVE that it is never too late to learn a skill," she said. "The program has taught us to use the machines and it has also made it easier to get along with people. Everyone here has been so encouraging. So have the teachers at my school. I hope to return to college eventually, thanks to their support."

"These women are anxious to learn," said Robert F. Kurrus, director of training. "Many of the trainees are women, so we have a fairly high turnover rate due to marriages and pregnancies. However, many of the women leave our program because they get promoted within the school system to clerk or secretary positions."

Project challenge is funded through Title One of the Elementary and Secondary School Act. Salaries range from $300 to $413 a month. The staff members, from the neighborhood, are chosen by the Board of Education.

IN ADDITION TO THEIR TRAINING for media work, the semi-professional staff learns proper work attitudes, promptness, neatness and tips on office dress and conduct. Mrs. Wright also attempts to help the women develop an understanding of the chain of command which they are likely to encounter while working for a large, highly organized school system.

"The changes in some of these women have been amazing," said Mrs. Wright. "They really appreciate the opportunity and we have had a near perfect record. Besides learning skills, they feel needed and useful. Both teachers and pupils depend on our technicians and they haven't been disappointed."

THE WOMEN ALSO OVERSEE the distribution of the films and books from the center's extensive library. Mrs. Esther Hatcher, film librarian, keeps a close check on the shipping and receiving procedures. She is responsible for getting films to the right schools and making sure they are returned to their proper places on the shelves. Like many of her coworkers, she supervises Neighborhood Youth Corps workers in the office.

"It is a great way to learn," she said. "One of the girls helps me with the filing system and the youngsters are very willing to help with anything that needs attention."

She said that the program had also broadened her social sphere.

"Folks speak to me now who never did before," she said. "I feel good about the job but it is reassuring to know that the commuity appreciates our efforts."

THE ATLANTA CONSTITUTION, Tues., Jan. 20, 1970

Older Citizens Enjoy Jobs

By JEAN THWAITE

Sarah Spier and Sophie Van Cleve have been training to become consumer aides for the Food and Drug Administration since last September.

As aides, they are now lecturing and conducting programs using movies and slides on such subjects as food labeling, hazardous substances, quackery, over the counter drugs, facts that will help the consumer in the marketplace.

The two women are participating in a project in the operation mainstream program of the United States Department of Labor. There are six such pilot projects in the United States run by the National Retired Teachers Association and the American Association of Retired Persons. The Labor Department asked this association to work with them because of its knowledge of the needs and experience of older people. Only persons 55 or older with an annual income of $1,600 for a single person or $2,100 for a couple are eligible for consideration.

Since the trainees or enrollees can be assigned only to organizations and agencies that give community service, the project has been named Community Service Aide Project. According to Octavia Taylor, project leader, only 52 applicants can be accepted, although a total of 108 have been interviewed after referral from the State Employment Service.

Community Service Aide Project is designed to demonstrate that older low-income persons are trainable and employable. Its aims are to provide meaningful permanent jobs; to demonstrate the employability of the older persons so that work projects can be extended to other cities; to give enrollees an opportunity to build their social security benefits and to give employers the benefit of the experience and competence of older persons.

These are the cold hard facts about the program but to Sophie Van Cleeve and Sarah Spier it is a program with a heart.

Both had suffered financial losses and their social security benefits were slim. Sophie admits that the best thing that going back to work has done for her is get her out into the world again with a place that she must go every day.

Sarah also found herself at loose ends after taking care of her brother through his terminal illness.

To their teacher, Mrs. Wilhelmina Lombardy, consumer information specialist for the FDA, they have been a blessing. Both can give many of the talks that she once had to give herself to consumer groups. All three have discovered that members of the audience will ask questions of Sophie and Sarah that they won't approach their boss with — perhaps her title scares them.

While other enrollees do perform direct service to children and the elderly and some work as office aides, teacher aides and housing aides in Model Cities, Sophie and Sarah feel that their job contributes a great deal as they help the homemaker to help herself.

Typical of their talks was one given by Mrs. Lombardy at the Golden Age Club sponsored by the National Council of Jewish Women on Piedmont Avenue. Mrs. Lombardy asked her audience to remember one thing if nothing else — read the label.

Shultz Urges Realism

Secretary Counsels Unions, Employers

By EARL GOLZ

Labor Secretary George P. Shultz warned here Monday that unions and employers may "negotiate themselves to where they are high and dry" if they sign labor contracts in 1970 that are "unrelated" to an expected cooling off in the nation's economy.

Union leaders who are publicly talking about projecting "very large amounts" in contracts this year without heeding an economic slowdown may fall into a "trap," Shultz said at a press conference in the Baker Hotel.

He said he hoped the economy is "cooled off and back on the path of strong and orderly growth." But he also noted he foresees "a lot of tension at many bargaining tables" during 1970 as the economy is "shifting gears."

Employers probably will be "a little stiffer" at the bargaining table this year, he said, because they will be "more worried about profits" than they were in 1969. On the other hand, unions such as the Brotherhood of Teamsters are talking about record wage and fringe increases this year.

"I suppose there may be some increase in strike activity," Shultz said.

He added, however, that he didn't think the Nixon administration would change its policy of encouraging labor and management to negotiate agreements without having "something forced (on them) by the government."

Not many strikes fall within the category of "imperiling the national health and safety," which could permit the federal government to get an injunction under the Taft-Hartley Act, Shultz said.

The "general run" of contract settlements in the construction industry this past year — a pattern of increases of about 15 per cent or more — is "not healthy" for the nation's economy, the labor secretary asserted.

"The definite slowing down of the economy we see as a healthy thing and a basic underlining note (to labor-management negotiations)," Shultz said.

Inflation is curbed, he said, when employers have more of a problem selling their products in the market place.

"We don't think a rise in unemployment curbs inflation," he said. "The administration is anxious to keep unemployment as low as possible."

Shultz noted that unemployment in the nation was 3.4 per cent last month, approximately the same as when President Nixon took office.

The former dean of the University of Chicago Graduate School of Business said it is possible, however, that unemployment might increase as inflation decreases.

Shultz said he has received "a lot of favorable mail from around the country" for his remarks earlier this month critical of Federal Reserve Board for "overdoing" its part in tightening the nation's money supply. The board has kept money supplies too constant for a number of months, he said.

Women Make Strides for Equality in Jobs

By PENNY LERNOUX
Copley News Service

BUENOS AIRES—Argentine women have made some sensational advances in the South American battle of the sexes.

While a working wife or daughter still shocks many men in other South American countries, Argentine males of all classes are accepting and often promoting women's economic independence.

Today, one out of six women has a job. Twenty-two per cent of the 7.5 million working population is female.

As a survey by the women's office of the labor department shows, the chief impetus is economic need although women from wealthy families often take jobs for social or intellectual reasons, particularly if they are single.

While Argentina's Eve can be envied by most of her Latin sisters, she still has a number of battles to fight to achieve equality in wages and position.

ACCORDING TO THE SURVEY, only one per cent of those interviewed held jobs demanding personal responsibility and decision-making.

Although the survey was limited to 60 companies with 70,130 employes in the Buenos Aires area it is considered a reasonable indicator of working women's situation in Argentina.

Signs of the times were the ages and concerns of the majority of the women interviewed.

Half were between 20 and 29 years of age and nearly three-quarters who worked were between 30 and 39 years—ample proof that customs have changed since grandmother's youth. No less than 38 per cent were working wives.

Argentine women reckon that better education is the only way to catch up with the opposite sex both in pay and position. While the educational level of the women interviewed approximated that of the men (primary school education for two-thirds), the majority wanted more technical training and believed specialization is of particular importance for individual progress.

Surprisingly, only 1.2 per cent of those interviewed showed any interest in union work although Argentina's labor movement long has played a major role in national affairs.

Women do hold important union jobs as they run banks, direct movies and judge court cases. But they are a small minority.

"A woman has to be twice as good and work twice as hard as a man to get a well-paying position with responsibility in Argentina," said one female executive.

THE MEN COUNTER this criticism by censuring women's irresponsibility. Nearly half the companies included in the survey said the principal problem with women employes was absenteeism.

If few women are climbing the executive ladder, they have achieved a predominant position in several important Argentine industries, including textiles and food.

And they can take heart in morse or encouraging prediction made by the nation's male-directed newspapers.

"It is true that few women hold important jobs or have ascended to positions of responsibility, but it will not be difficult for them to do so in a more or less short time because the trend of the present is toward the female executives," editorialized the Buenos Aires daily La Nacion.

Willingly or not, Argentine men recognize "it's a losing battle."

Stanford Gets Grant to Train Minority Doctors

Stanford University's Medical Center announced yesterday that it has won a $65,000 grant from the Carnegie Foundation to finance the first stages of an unusual minority training program.

The program is designed to train minority people as doctor's assistants — "paramedical personnel," in medical jargon — and, said Director Thomas A. Gonda of the Stanford University Hospital, it "may well become the prototype for a nationwide effort."

The Carnegie grant will be used to conduct the first part of what is a three-part program and to plan the second part.

In the first stage, trainees will be helped to get high school diplomas, through use of the latest computer techniques.

Stanford still is seeking funds for the second and third stages. In stage two, trainees would learn medical techniques; in stage three, they would be trained to assist doctors.

S. F. Sunday Examiner & Chronicle, January 18, 1970

Management Jobs Sought for Minorities

Graduate schools of management at Berkeley and Stanford have joined a nine-campus national effort to increase the flow of Negroes and other minority persons into significant managerial positions.

The project, announced yesterday by The Alfred P. Sloan Foundation, New York, will be called the Council for Opportunity in Graduate Management Education.

Joining Berkeley and Stanford will be graduate management schools at Columbia, Cornell, Dartmouth, Harvard, Massachusetts Institute of Technology, University of Pennsylvania, and Carnegie-Mellon.

A grant of $1 million will support the program in its first year, the foundation announced.

The council expects participating schools to review recruiting procedures, strengthen job placement services, expand special preparatory programs, provide added counseling to students, and adapt courses of study to career goals of newly recruited minority students.

Job-hunters should shave, survey indicates

By NORMAN KEMPSTER

WASHINGTON, D.C. (UPI)—The nation's businessmen have become increasingly tolerant of beards, mini-skirts and other "now" styles on current employees but they often refuse to hire job applicants sporting the mod look.

A newly published survey on management and the generation gap shows that employers have modified their rules of good taste and grooming but that traditional attire is still the safest for the worker who wants to stay out of trouble with the boss.

The survey, sponsored jointly by the American Society for Personnel Administration and the Bureau of National Affairs Inc., drew responses from more than 150 personnel executives from a cross-section of American business. These were the results:

Almost 80 percent of the employers would prefer not to hire a bearded job applicant, and would take a clean-shaven individual if other things were equal. But 80 percent of the firms either had no objection to a beard on an already-hired employee, or would object only in extreme cases.

Almost 60 percent of the companies said they would be likely to reject a woman applicant who appeared in a mini-skirt but 45 percent of the employers said they have no objection to mini-skirts on employees.

Long sideburns and mustaches have won general acceptance. None of the companies surveyed forbids sideburns or would refuse to hire an individual wearing them. Only about 2 percent would reject an applicant or fire an employee for wearing a mustache.

An Afro hairstyle on a black applicant would be acceptable by 47 percent of the companies for women and 41 percent for men. It would be regarded as a negative factor for both sexes by 42 percent of the companies and 16 percent said they would flatly refuse to hire a man wearing one and 11 percent said they would reject such a woman.

PRICES
CONT.

ence in Orlando, Fla., last week. Costs must be met, he insisted.

Many economists contend that costs will continue going up as long as wages rise; moderation in settlements would lead, they say, to a slowing down of inflationary price increases. Labor's leaders and economists —and a substantial portion of its millions of members—say that prices must be controlled first, and when the rise slows, labor can moderate its demands.

Labor is willing to accept a full-control system "if necessary"— provided that it applies equally to profits, dividends, and other corporate payouts; and to wages and prices. It emphasizes that nothing short of that will win labor's support.

MANAGEMENT

New dean, new era for Harvard B-school

Dean Fouraker can be sure of one thing. He will not be bored

Early next month, 1,400 of the nation's corporate, banking, and brokerage elite will assemble at a blue-ribbon dinner at Manhattan's Americana Hotel. The ostensible occasion: presentation of the Harvard Business School Club of New York's annual business statesman award to retiring B-school dean George P. Baker. But the dinner will also offer most of the audience their first look at Baker's virtually unknown successor, a lanky Texan named Lawrence E. Fouraker, whose prairie background is in vivid contrast to that of the patrician, New England-bred Baker.

When Harvard President Nathan Pusey announced Fouraker as his handpicked choice last November, the man was so little known that many B-school professors gave little speeches about his background and qualifications to their classes. But, at next month's dinner, a 76-place, pyramiding dais will bear ample witness that his new post is not obscure. On that dais will be the likes of Coca-Cola's J. Paul Austin, Atlantic Richfield's Thornton F. Bradshaw, Thomas S. Carroll of Lever Bros., Donald C. Cook of American Electric Power, General Foods' W. C. Cook, G. Keith Funston, and Procter & Gamble's Neil H. McElroy.

Job. Fouraker, 46, a Harvard professor since 1961, is an "experimental economist" who has taught business and government relations and headed the school's international business and research areas, applying theory to practical business problems. Now the Texas A. & M. graduate will have to apply persuasion to bridge the gap between the business and academic communities. He has his job cut out for him:

- Some students are suspicious and cynical about all large organizations, including corporations.
- Courses that stress social problems and environmental controls rather than just profitability are in increasing demand.
- The percentage of women and blacks in B-school programs is rising dramatically.
- Students who opt for business are attracted by small companies or opportunities to set up their own firms.
- An increasingly international outlook is infusing course work, recruiting, faculty and students.
- The high price tag on MBAs is turning off some cost-conscious companies.

New Dean Lawrence E. Fouraker will keep B-school focus on business problems.

Demand. Fouraker takes over at a time when the Harvard Business School's largest and best known product, the MBA, is enjoying unprecedented popularity. Manufacturing firms, consultants, accountants, bankers, brokerage houses, real estate syndicates, government agencies, and colleges sign up a year in advance to recruit on campus and find themselves shelling out $14,000 or more in starting salary. And salaries will be up a bit this year, predicts John E. Steele, Harvard's placement director, despite the fact that some companies are cutting back on the number of MBAs they plan to take.

Many businessmen, such as Tom Morris, manager of college relations for American Airlines, believe that the Harvard MBA "is always among the very best." MBAs coming out of other B-schools are as good, he concedes, but "I guess the big difference is that you can depend on the Harvard MBA."

An auto industry recruiter agrees that Harvard is "at the top of the list." His company has a policy limiting starting salaries, but "we will break the rules substantially to get people from Harvard," he says. Their starting rate: $1,200 to $1,500 a month.

Strengths. Fouraker has another important asset going for him: The Harvard Business School faculty seems uniquely united, even though it features some well-endowed egos. "People do a pretty good job of talking to each other around here, of keeping the channels open," says Paul R. Lawrence, who heads the school's human relations area. Faculty members like to think Harvard's famed give-and-take case method has something to do with this.

Fouraker is taking over an impressively well-heeled establishment from Baker, dean from 1962 until this academic year when he turned 66—Harvard's mandatory retirement age for administrators. Baker has been most successful in shaking the money tree, the No. 1 task of a B-school dean.

Last year, the alumni fund hauled in more than $1-million toward the school's $14.7-million operating budget. The Associates, a select group of more than 400 leading corporations, kicked in another $970,000. Under Baker, the

number of endowed professorships increased from 14 to 35, and the current going rate, once as low as $600, is $1-million a chair.

Meantime, the school is also completing a major program of construction. New facilities for the executive development program, international teacher training, and the *Harvard Business Review*, as well as two new office buildings and an auditorium, are scattered among the gracious neo-Georgian structures on the Boston side of the Charles River.

New age. But to old grads visiting the campus, perhaps the most striking change is the growing number of women and black students. Women were not admitted into the first-year MBA program until 1963. Now there are close to 60 in the two-year program, including one shapely, miniskirted lass recently seen puffing away on her pipe. Another dozen or so are in the doctoral program and some faculty members predict that, by the 1980s, half or more of the students may be female.

Last spring after the faculty hammered through what it calls its "disadvantaged minorities program," the school raised a fellowship kitty of some $450,000, mainly from business, and set out to recruit non-whites. "You've got a pretty sterile program if you're talking about black development programs and there are no black students in class," says Fouraker. And this year, 10% of the entering MBA class of 774 was black, joining more than 20 blacks in the second-year MBA program. Last week, Harvard and eight other leading B-schools launched a program aimed at recruiting more blacks, financed by a $1-million grant from the Alfred P. Sloan Foundation.

The growing ratio of women and blacks startles the old grads

Reaching out. Critics have said that nothing becomes the Business School more than its splendid isolation. The Anderson Bridge, which links Soldiers Field and the Business School on the Boston side with Harvard Square on the Cambridge bank, was once termed "the world's longest bridge" by a B-school professor. The Charles River was a psychological and physical barrier.

But all this may be changing, too. New this year, a joint graduate degree with the Law School permits a student to garner both an MBA and a JD in four years. Maurice D. Kilbridge, the new dean of Harvard's Graduate School of Design, came from the Business School. A growing number of B-school professors are teaching courses across the river.

Ferment. And student attitudes are

B-school's link to businessmen

For thousands of businessmen, the *Harvard Business Review* is the gospel according to Harvard B-school. Every two months, the snow-white Review slides into the in-baskets of more than 100,000 executives. Many of them have never set foot in the B-school's classrooms but they subscribe in order to keep up with current thinking on the school's Soldiers Field campus.

But not all of its subscribers may be getting what they bargained for. In 1969, only 16 of the Review's 76 articles, or about 21% of them, were written by the B-school faculty. Other contributors included general business writers, executives, management consultants, and professors from other schools. Still, in the eyes of Edward Bursk, 62, editor of *HBR* since 1947, the Review provides "a bridge between the academic and research world and the practical, operating businessman's world."

Rejects. One out of four articles in the Review is by a businessman. Sometimes this poses problems for Bursk and his 17-man editorial staff. When such articles are patently self-serving or obviously ghost-written, they "are pretty easy to reject," says Bursk. Once, to the horror of Ford executives, he bounced an article by Henry Ford II on the value of stock options as an executive incentive. Ford polished up the piece and Bursk printed it. "We are damned near as tough on a president of a large corporation as we are on anyone else," he says.

Still, he concedes that "we like to have articles by company presidents." Recent contributors include Eli Goldston, president of Eastern Gas & Fuel Associates, who wrote about his company's program for ghetto housing rehabilitation; J. Erwin Miller of Cummins Engine Co., on business's role in meeting social crises; George Champion of Chase Manhattan Bank, on the same topic; Roger Blough of U. S Steel Corp., on the problem of attracting youth to business; and Willard F. Rockwell, Jr., of Rockwell Mfg. Co., whose subject was how to acquire a company.

Gratifying. The Review's standard honorarium for contributors is only $100. But Bursk is amused at "how childishly pleased the president of a corporation will be to be paid for writing something." And some top men use the Review to bounce ideas into their own organizations.

As a rule, the Review's editorial content is not calculated to stir the blood. Still, at least two of its more controversial articles have drawn indignant mail. One of the articles proposed that 10% of the stock in top companies be turned over to the black community. The other likened business ethics to poker, in which deceit is implicit as part of the game. Vigorous reaction to these articles pleased Bursk. "We are not a house organ," he says.

Operationally, the Review is fairly independent of the B-school. A 15-man faculty board appointed by the dean is responsible for overall editorial policy. "We are left pretty well alone," says Bursk. However, a B-school dean once protested a Review direct-mail piece as insufficiently dignified because it featured the head and shoulders of a pretty girl.

Profits. Though it is no sprightly reading experience, the Review is a money-maker, as befits an arm of the B-school. Founded as a quarterly in 1922, it never had a circulation of more than 5,000 until the early 1940s. But its postwar circulation shot up to 15,000, and the current January-February issue went out to nearly 120,000 paid subscribers, double the figure of a decade ago.

The Review is officially a non-profit organization. But, says Bursk, "our income exceeds our outgo." In 1968, it received close to $1-million in circulation revenue and better than $425,000 in advertising. The charge for one black-and-white, full-page ad is $2,060. Reprints, single-copy, and bound-copy sales added about $450,000 in 1968. For the year, the Review netted close to $400,000.

The Review's new $800,000 home

Its income is routed to the over-all B-school budget, except for funds earmarked for the Review's own operations. And this includes the $800,000 used to build ultra-modern new quarters into which the Review staff moves next month.

changing. Most observers concede readily that many of the students in the MBA program are far different from the popular B-school stereotype of the clean-shaven close-shorn young executive-to-be rushing to class with attaché case in tow. While at least half the male MBAs still religiously appear in the lecture hall in dark suit, white-shirt, and tie, other males may sport collar-level haircuts, fancy sideburns, or beards.

No longer does the profit motive monopolize their thinking. Many are demanding courses about the problems of non-business organizations: community development corporations, governmental agencies, hospitals, museums, educational institutions. They are asking questions about business' social role and responsibilities, and are all worked up about the physical environment in which business operates and the problems of the cities.

"Just count the times 'urban' now appears in the catalog," says C. Roland Christiansen, who teaches business policy. In addition to traditional courses in marketing, finance, banking, production, and control, second-year MBAs may take courses in black power and

'Urban' crops up throughout the school catalog

the business community, organization development in the inner city, urban land development, business and society in black Africa, or a seminar on low-income housing.

"We still have plenty of students who feel they've got to go out, make a fortune, and get rich. Some of the others are more interested in how to straighten out society," says Arthur Schleifer, Jr., who heads the admissions committee. "Even to those who want to make it quick, then worry about society—it's more of a worry than it used to be." As one MBA puts it: "What good is an extra dollar if you can't get to the city to spend it?"

Outward. Student interest in business abroad is reflected by new cases on business problems outside North America. About 10% of the MBAs are from outside the U. S. and the number may increase. This year 20 European companies will be recruiting at the B-school, compared with only one four years ago.

This will not make matters easier for the big U. S. industrial corporations, which already are finding it increasingly difficult to attract MBAs. Such big companies took 45% of the MBAs from Harvard in 1966, and only 33% last year. Ironically, many of these companies are the most enthusiastic supporters of business education.

Today, some MBAs are attracted by

Auto Mechanics:

Time for a Model Change?

By Emil Michael Aun

Two years ago a consumer organization bought and examined an automobile. Among the malfunctioning parts were the choke, the exhaust system, the carburetor float, the accelerator pump and pedal, the carburetor, the rear axle, a front wheel, the headlights, the front seat, a window, the fuel gauge, a rear coil spring, the air-conditioner, and the speedometer.

A used car? No, it was brand new, a 1969 best-selling model, fresh from the dealer. Admittedly it was a lemon. Most new cars have far fewer defects. But this case history does illustrate one reason why the shortage of mechanics is acute today. Cars are so complicated that it is becoming harder and harder to build them properly and keep them in good repair. Today's automobile has more than 15,000 parts.

"We seem to be fighting the losing battle of an increasingly complex vehicle," said Paul F. Lorenz, former marketing vice president for the Ford Motor Company and president of Ford of Europe.

To further aggravate the situation, there are more and more kinds of cars on the road and fewer and fewer are "plain Janes"—trade lingo for standard models with few options. Air-conditioning, a rarity in 1957, was bought by almost 40 percent of Ford's 1968 model customers. Power brakes and power steering installations more than doubled in that period. Complex new safety and emission control devices also were introduced during the sixties.

As a result, "the skills required of a proficient general automotive mechanic today are probably unparalleled in any industry," said Robert Straub, former president of the Independent Garage Owners of America. "He must know hydraulics, pneumatics, electricity, mechanics, and must have a basic grasp of chemistry, physics, and metallurgy."

More mechanics also are needed because of the growing number of States which require periodic motor vehicle inspection. Thirty-two States now have such laws covering 55 percent of the motor vehicles in the U.S.

How many mechanics do we have and how many do we need? Some 825,000 people were employed as motor vehicle mechanics and repairmen in 1968, according to the Bureau of Labor Statistics. This was an increase of 182,000 over 1950. And the net number in the trade is rising at about 16,400 a year.

Most experts think this is not nearly enough. For while repairmen and mechanics increased 28 percent in the 18-year period, the number of motor vehicles on the road more than doubled—from 49.3 million to 101 million. "Five years from now, at the current rate of expansion, the average man or woman . . . will have an easier time getting a reservation for a trip to the moon than . . . getting a reservation to get the car fixed," according to William W. Winpisinger, general vice president of the International Association of Machinists and Aerospace Workers (IAM).

Estimates vary wildly as to how many more repairmen are needed. "If we are to make any real progress toward getting the number of mechanics we should have by 1975, we will have to recruit at least 50,000 a year," said Chrysler President Vergil Boyd in 1965. "There is no real

Mr. Aun is associate editor of MANPOWER.

shortage of mechanics," said American Motors general service manager George Brown in December 1969, "just a shortage of sound service management with resulting inefficient mechanic utilization."

Officials of the Automotive Services Industry Association say from 125,000 to 200,000 additional properly trained mechanics and body repairmen are needed now. MOTOR AGE, a trade magazine, estimated a year ago that 763,000 new repairmen would have to be trained in the next 9 years, plus 20,000 annual replacements for retirements, deaths, and dropouts. "Nobody knows," says the Independent Garage Owners of America, Inc.

Part of the difficulty is in defining what a mechanic is. The Bureau of Labor Statistics uses a list of nearly 200 job titles, ranging from adjuster to windshield man, that fall in the general category of auto repairman. While the DICTIONARY OF OCCUPATIONAL TITLES, published by the U.S. Department of Labor, includes a concise description of an automobile mechanic, there is little agreement in the industry as to the requirements of the work or the qualifications of the workman. Many men call themselves mechanics when in fact they are tune-up men, brake men, or other limited specialists.

Entrance Routes Vary

The Bureau of Apprenticeship and Training specifies a fairly rigid 4-year course of training and study for a journeyman mechanic in either engine or body work, and a 3-year program for automotive painters. The IAM supports and promotes apprenticeship but also considers a man with 4 years of on-the-job experience a qualified craftsman. The Auto Body Association of America estimates that 5 years of training and experience are required to produce a good metal man and 3½ years to make a good painter.

To scramble the picture further, there is no single source for producing auto repairmen, as there is for training doctors, lawyers, and other professionals. Some enter the trade from vocational schools or special training programs funded by the Federal Government. Others go the apprenticeship route. But the usual pathway for a mechanic is "beginning in a service station, moving on to a

Labor Dept. photos by Billy Rose

repair shop, and then going either to a car dealer, a fleet, or a mass merchandiser," according to John P. Kushnerick, editor and publisher of MOTOR AGE. "There is no way to distinguish between a really skilled expert and a half-trained and generally incompetent shade tree mechanic," he said.

The absence of a generally acceptable definition of a mechanic is hampering efforts to overcome manpower shortages, contends Paul McDonald, manager of General Motors Training Centers. "It's the key question and our inability to answer it is causing all the trouble," he said. "Suppose you went to a hospital and everyone who touches you or serves you —including the person who takes your temperature or remakes your bed—was called a doctor. You'd have a hard time deciding on shortages of personnel, or pay scales or training needed. But something like this happens when you enter a garage. The man who fills your battery with water and the most skilled technician in the place are both called mechanics."

As a consequence, auto owners are finding it more and more difficult, and more and more costly, to keep their vehicles in repair. A recent survey in St. Louis of 6,500 repairs done on 2,000 vehicles found that more than a third of all needed work either was not done or was performed unsatisfactorily.

There is considerable disagreement on why more people do not become auto repairmen. The unions blame it on poor working conditions, mediocre pay, and lack of prestige. "Mechanics are probably the lowest paid occupation in relation to the degree of skill required in the entire country," according to IAM's Winpisinger, whose union represents more than 117,000 engine and body craftsmen. He said that in 1967, the average mechanic earned $3.36 an hour (based on Bureau of Labor Statistics for fleet mechanics) compared to $3.59 for factory maintenance machinists and $5.09 for building trades journeymen. (Mechanic earnings are now an estimated $3.59 hourly.) "In most places, particularly in the smaller

cities and towns, it does not pay a young man to take the time and training required to learn the fundamental skills of a qualified mechanic," Winpisinger said.

Furthermore, most mechanics work and are paid on a "flat rate" system, which he calls essentially piece work and "a relic of an earlier age." Flat rate manuals are based on manufacturer time studies. The manuals allow so much time for the mechanic to complete a specific repair job, for example seven-tenths of an hour to adjust the front end alinement of a Buick. The mechanic receives no additional pay for any time spent on a job beyond that allowed by the manual and "it is very easy to bump into unforeseen difficulties," said Winpisinger. Many experienced mechanics like the system because they can beat the book and earn high pay, he admitted. But the slower workers and novices are discouraged. They are in effect training at their own expense, he said. Furthermore, under these conditions, "journeymen are reluctant to take their own time to teach apprentices."

The prestige factor is more subtle but still an effective barrier to new recruits, the union says. Too many people think the trade is beneath their children. "The average parent believes his offspring is infinitely better off making $95 a week with a white shirt on than he would be making $135 a week with coveralls and dirty fingernails," said Winpisinger. "It is a white collar society and a white collar psychology."

Ford Motor Company disagrees about the pay. "The problem of attracting job entrants to the skilled service trades is not related directly to compensation," Lorenz told the Federal Trade Commission on January 10, 1969. "Our surveys show that the average mechanic employed in a metropolitan-area dealership today earns nearly $10,000. Many earn more than $15,000."

He agreed however that the trade suffers from a poor image. "We have created what must be considered an almost cult-like reverence for high-status positions, and high status is not one of the rewards that attach easily to a career as an automobile mechanic . . ."

Whatever the reason, the industry's dropout rate is formidable. In 1966, Ford surveyed 5,000 vocational schools in the United States that offered some form of automotive training. Some 2,700 reported they had a complete automobile training course and that they had graduated 98,000 students in 1966. A followup survey found that only 17,000 had actually entered the automobile service field.

A partial explanation may be the type of student who graduates from vocational high schools. Very often he is not interested in academic work and because he is too young to drop out he switches to vocational school. "As long as he has to stay in school he feels he might as well take something that's fun," said General Motors' McDonald. "He has no intention of going into the trade. He does it as a hobby, so he can learn how to keep his car in trim. We have to graduate 100 to get 15 on the job."

A number of forces are at work that apparently tend to keep mechanic wages down. The IAM links low pay scales to "the general weakness of union influence in the auto repair industry." Less than 20 percent of auto mechanics belong to a union. They are therefore unable to confront their employers with the strength which workers in highly unionized industries bring to the bargaining table. Another factor is the intense competition in the repair business. Maintenance and repair of all motor vehicles is now an estimated $25 billion annual business and scrambling for a share are some 391,000 service outlets. These include more than 33,000 franchised dealers, 72,000 independent shops, 44,000 specialty repair shops, 211,000 gasoline service stations, 11,000 miscellaneous aircraft, marine, and automotive outlets, and nearly 21,000 tire, battery, and accessory dealers.

Dealers' Share Dwindles

Franchised dealers have watched their share of the auto repair market dwindle from 41 percent in 1955 to 32 percent by 1967. Both they and the independent garages are losing out to mass merchandisers led by Sears (with more than 800 auto repair centers), Montgomery Ward, J. C. Penney, and others. Chain operators, who perform only specialty repairs (wheel alinement, brake service) are "creaming the business—doing only the most profit-

able work. Faced with this kind of competition, dealers and independent garages are finding it harder to keep afloat as their earnings dwindle. The typical dealer operation, for example, now earns a profit of under 2 percent of sales, according to the National Automobile Dealers Association. The need to keep down expenses, including labor costs, seems to them imperative.

The claims payment system used by auto insurers also acts to keep down prices, and thus profits and wages. The costs for repairs (not maintenance) for American passenger vehicles is now running to about $8.8 billion annually. Nearly half this cost, more than $4 billion, was met by the insurance industry in 1968 to pay off 20 million auto-related claims. The insurers quite naturally exercise great care to keep repair costs down. The usual device is to require bids from three separate garages before permitting any repair work to be done, with the work awarded to the lowest bidder.

The resulting pressures, observers believe, are eroding the standards of the trade and scaring away possible recruits. "With the factory riding herd on the dealers, with the dealers constantly being squeezed into trying to save a buck, especially on warranty work, some corners inevitably get cut," according to IAM's Winpisinger. "The mechanic in the shop is put under pressure to do less than an adequate job, not because he does not know how to do it better but because it is cheaper and faster—and sometimes more in line with the flat rate manual—to do it inadequately."

Glen F. Kriegel, president of Auto Analysts, Inc., a diagnostic firm, said failure to establish "automotive mechanics as a profession" has made the field unattractive to the younger generation. "No air of pride of accomplishment or professionalism seems to exist," said Kriegel. "The mechanic who does exhibit some of these traits is soon caught up in the press for commission rates on hours and parts and turns his back on maintaining his professional standing and is willing to do substandard work."

As a solution, Kriegel proposes licensing automotive mechanics. Three bills on licensing have been introduced in Congress. Generally, they provide for Federal grants-in-aid to encourage States to license motor vehicle mechanics and set up training programs of 2 or 3 years to prepare candidates to meet specified levels of competence.

"The aircraft mechanic is well-trained, reliable and maintains his professional attitude and standing," said Kriegel. "His attaining of a license and . . . the knowledge that he will be held strictly accountable for his work seems to be the key to his professional attitude and social standing. Here is the route the automotive service industry must follow: Professionally licensing mechanics and structuring salaries sufficiently to eliminate the commission system and attract new men into the profession."

Licensing Effect Debated

IAM does not oppose licensing outright but the union's Annual Automotive Conference in June 1968 laid down several conditions for accepting it. Any legislation that requires mechanics to be licensed should also register and regulate automotive repair dealers, the union believes. Mechanics with 4 years' experience should be licensed automatically. Labor should receive "equal representation" on the licensing authority. Any proposed law should also include:

- "Procedures for insuring that customers receive fair and honest treatment including recourse to the licensing board and, upon proof of charges, compensation for any damages suffered.
- "Guarantees that the trade does not become fragmented through the granting of too many kinds of specialized licenses; that is, brake mechanics, transmission mechanics, tune-up mechanics, or other specialists.
- "Mandatory periodic vehicle inspection by competent licensed mechanics and not by police or other governmental agencies."

Manufacturers and dealers are even less sanguine about the benefits of licensing. "If any more roadblocks are thrown up to acquiring mechanics than we have now, it could have a very detrimental effect," said T. A. Williams, Sr., former president of the National Automobile Dealers Association. General Motors opposed licensing at hearings last October on the automotive repair industry before the Senate Subcommittee on Antitrust and Monopoly. The grounds for opposition were that licensing would "tend to decrease both the number of service outlets and the number of mechanics." American Motors also is opposed. "It would be the wrong solution," said George Brown, general service manager for American Motors, at a Detroit press conference in December. "I think the shop operator should have to certify that the work is done right."

The industry is now seeking a workable middle way that would yield the benefits of licensing (encouraging the creation of reliable servicemen) without the apparent drawbacks (blocking entry to the trade of those who pick it up along the way).

Three trade groups have concluded that certification is the answer and have created the National Automotive Technician Certification Board (NATCB) to carry out the scheme on a national scale. The plan is strictly voluntary and any mechanic who meets the requirements will be certified as a qualified service technician. Board members represent the three sponsoring trade associations, the Independent Garage Owners of America (IGOA), the National Congress of Petroleum Retailers, and the Automotive Service Industry Association. Operations are scheduled to begin this month.

Candidates may qualify for certification in one or more of 15 specialties: Engine overhaul, electrical systems, carburetion, cooling systems, braking systems, automatic transmission, front end, air-conditioning, power train and standard transmission, standard and power steering, body and fender, paint, glass, truck repairman, and frame. Any mechanic who successfully passes examinations in 8 of the first 10 categories will be awarded a Master Technicians Certificate. Proponents of the plan feel it will go a long way toward easing the effects of the manpower shortage in the trade.

"It will increase the production of the people able to be certified," said Barry McNulty, executive vice president of the Independent Garage Owners of America. "They will be in a position to make more money. This is an upgrading process and will add stature to the trade. Over the long run it will increase our ability to recruit qualified people, because it offers mechanics increased prestige and income, and it will give the public more confidence in the men to whom they entrust their cars for repairs."

The plan grew out of a 4-year test run by IGOA affiliates in Arizona and several

other States. The Arizona plan proved the most practical and has now become the national plan. All certificates awarded in the test States will be honored by the National Automotive Technician Certification Board. To be certified, all candidates, regardless of length of experience, must pass the examination and must be reexamined and recertified every 3 years. To take the examination a mechanic must have 2 years experience in the specialty in which he wishes to qualify. The cost is $6. Test and study materials will be provided to the candidates. Examiners are now being named in each State and a schedule of examining locations is being established.

The National Auto Dealers Association (NADA) also is working on a certification program but it is not nearly as far advanced. Members of NADA are frankly divided over the advisability of establishing a separate program. Many of them would prefer to join forces with the other three trade groups and give full support to the NATCB. This would create in support of certification a combination of groups representing perhaps 80 percent of the repair industry.

One of the main effects of either licensing or certification would be to derive through upgrading better production and service from existing automotive repair manpower. Automobile manufacturers are trying to arrive at the same end by another route. They want to stretch available manpower by upgrading management and reorganizing garage work schedules. Backed by the representatives of the auto companies, the Automobile Manufacturers Association introduced in December a suggested new 2-year course in auto service management for community college students. The association hopes to have community colleges throughout the country adopt it as a part of their regular curriculum. Associate of Arts degrees would be awarded to graduates. Suggested subjects range from "Engine Diagnosis and Tune Up" to "Accounting and Business Organization."

Mismanagement is the underlying reason for service problems, according to Magnus von Braun, director of product and customer service for Chrysler, in support of the degree program. "I am convinced that if mechanics are put to work in accordance with their skill levels, most of the alleged shortages would vanish." American Motors' George Brown agrees: "We analyzed service operations at 50 of our dealerships and found that a 40-hour-a-week mechanic actually was working an average of only 28 hours. It's not his fault. It's the way dealerships are scheduling service."

Service directors for the auto companies say that due to poor planning dealership repair facilities tend to be jammed on Mondays and Tuesdays and almost out of work on Fridays. And often skilled mechanics waste their time on such routine tasks as removing hub caps and installing batteries.

Different Skill Levels Set

A recent experiment conducted by the NADA and Chrysler indicates the manufacturers may be on the right track. The 1-year pilot operation was carried out in four dealerships handling Chrysler products and demonstrated that shops can be reorganized to use the skills of mechanics and managers more effectively.

Mechanics in the pilot shops were divided into four grades, based on ability. Cars brought in for repair were rated as to the skills needed for service and then assigned to the appropriate serviceman. These ratings also determined pricing to the customers; they paid less for lesser skills. The mechanics were taken off commission and paid a guaranteed hourly salary keyed directly to their demonstrated earning levels. As a man's output increased, he earned a bonus based on his higher productivity. As he improved his skills rating, he moved up the ladder to the next higher pay grade.

"We've almost eliminated complaints," said John S. Hinckley, owner of a Dodge dealership in Ogden, Utah, one of the experimental shops. "The job goes to the man with the greatest skills, assuring much greater quality of work, which means fewer complaints and need for comebacks." He added a comment that may presage the opening of a wide doorway into the trade for the disadvantaged: "With this plan we can use a lot more people with few skills for jobs that do not require an expert."

Regardless of the changes in shop management, or the development of licensing and certification procedures, a steady supply of manpower must continue to flow into the automotive repair industry, as it must in nearly every trade. Whose primary responsibility is it to train these men? Some experts point to the manufacturers. The manufacturers say the dealers. As a practical matter, however, most dealers and independent garages are too small to support a training program of any size or length. Consequently much of the burden has fallen upon the manufacturers, the schools, and the Federal Government.

Ford, for example, operates full-time tuition-free training schools in 39 major cities for dealer mechanics. During the 1968 model year alone, the company gave more than 600,000 hours of technical service training to 29,000 mechanics.

General Motors began a training center program in 1953 and now has 30 such centers throughout the United States. From inception to the beginning of 1969, these centers provided 32 million man hours of instruction for servicemen and the current cost to the company is $7.5 million a year. Chrysler and American Motors have similar programs. In addition, the auto companies have funded a number of experimental efforts to improve service, upgrade vocational schools, and entice new talent into the trade.

For the past 9 years Ford has provided after-hours vocational training in public

schools for high school seniors, and job entry training is given to new recruits to the trade in each Ford service training center. The company has donated over $8 million worth of engines and other assemblies to schools for use in vocational training.

Chrysler and Ford have mechanic training programs for the hard-core unemployed. And Ford and General Motors work with Project Transition, a Federal program to give servicemen about to be discharged several months of job training in auto repair. In the first 10 months of 1969, GM enrolled 1,377 Project Transition trainees in its 6-week, 240-hour Advanced Vocational Training Program along with 1,219 young men graduating from vocational schools. During the same period, GM's 4-year-old Dealer Cooperative Work Training Program enrolled 2,084 underemployed dealer or service station employees. The combined classroom and on-the-job course lasts 16 weeks and makes young men with mechanical aptitudes "employable service technicians," according to GM's Paul McDonald.

The U.S. Department of Labor's contribution to training has been substantial. Job Corps has trained about 5,000 youngsters in automotive repair courses lasting 12 weeks to 2 years. The Manpower Development and Training Act from its inception in 1962 through fiscal year 1969 had enrolled nearly 78,000 people in automotive training programs. And through June 1969, employers participating in the Job Opportunities in the Business Sector (JOBS) Program had signed contracts with the Labor Department to receive Federal funds to hire and train 1,300 disadvantaged hard-core unemployed persons for automotive repair work. The industry generally welcomes government help, but experts are sharply divided over the current effort of the Labor Department to move the hard-core unemployed into repair shops.

Dr. William N. Leonard, professor of economics at Hofstra University, is very much in favor of it. "A crash program is needed in ghetto areas to get . . . youth off the streets into educational and training programs which will make them into skilled mechanics," he said. He added that boys 18 and 19, among whom unemployment is particularly high, have "a strong interest in automobiles; instead of stealing cars they could be fixing them."

Athell Yon, speaking on behalf of the Independent Garage Owners of America, of which he is former president, believes this scheme unworkable. "The people we need must possess real skills," he said. "For example they must read blueprints, follow complicated diagrams, work in tolerances of one-ten-thousandths of an inch. To take a severely disadvantaged person off the street and train him to this degree of accuracy and usefulness is almost impossible." Representatives of General Motors and the Automotive Services Industry Association agree with this view.

More Upgrading Sought

The Independent Garage Owners does have an alternative. As Yon explained it, the group would like a program that permits repair shops to use half the allocated Government funds to hire a severely disadvantaged person and half to upgrade a person already employed in the garage—say a greaser or gas pumper. The old employee would be trained as a mechanic and the new employee would replace him. IAM's Winpisinger said this plan made sense to him "both in terms of manpower requirements and in terms of cost to the employer." Since the suggestion was made more than a year ago, the Department of Labor has moved in that direction. The new JOBS contracts permit an employer to upgrade 30 people for every 100 disadvantaged workers he hires.

The Department of Labor recognizes that training the hard-core unemployed for highly skilled jobs is a slow process, but based on experience believes it can be done. "Apprenticeable crafts, particularly the building trades, are successfully training the disadvantaged in ever-increasing numbers," said Manpower Administrator Malcolm Lovell. "And other manpower programs have demonstrated that in relatively short periods of time the disadvantaged can be trained for certain specialty work and for entry-level jobs in several hundred skills and trades, including automotive repair. It may take a little extra time and the trainees may need extra counseling and remedial education, but it can and is being done successfully.

"The auto repair industry's own research shows that people of varying skills, from beginner to master technician, can make a significant contribution to the profitable operation of a repair facility. Our programs are sufficiently varied to train men of different abilities to fill these jobs and help supply the industry's manpower needs." □

Viola Severance reacts during class discussion at Lenoir Community College.

For Viola Severance it's Goodbye to second-class jobs.

When Viola Severance dropped out of school in the ninth grade, her prospects for a good job dropped as well.

She didn't exactly resign herself to second-class jobs, but she knew she had a handicap. She worked nights at a shirt label factory, as a waitress, and as an employee of a religious charity.

When Lenoir Community College announced its joint manpower program with MDC, Miss Severance was one of those most interested in participating.

She hadn't had enough education, but she was bright. "Viola did particularly well in adult basic education," said her instructor, Dot Reeves. "And she's highly motivated now, you'd be safe to say that."

She dropped out of the Lenoir-MDC program, just as she had dropped out of high school—but this time with the advice and support of her instructors. At the end of the sixth week of the eight-week course, she joined a New Careers program. Now she is continuing her education at Lenoir Community College in the afternoons and working mornings in a New Careers program in La Grange. She's making the $1.60 federal hourly minimum now and will go to $1.80 in three months.

What is she doing? "Exactly what I wanted to do," she says. "I'm working with children who have reading problems."

Working with children, and working toward further educational advancement to help her in this field—that's nice work for a high school dropout.

EVOLUTION OF A NEW IDEA

The MDC-Lenoir Community College Manpower Program and How it Grew

August 14, 1967: The North Carolina Manpower Development Corporation was chartered by the State of North Carolina as a private, nonprofit corporation operating under grants from federal sources and private foundations to develop a manpower model for the State. It was hoped that this model of a statewide manpower program would be useful nationally. Studies of how the manpower process worked in North Carolina—and of where it broke down—were authorized.

January 22, 1968: The studies having shown a lack of training leading to jobs for the disadvantaged population of the State, MDC opened an experimental manpower training center in Greensboro. The center was staffed with specialists in finding, counseling, training, and getting employment for the disadvantaged. Policy was set by an advisory committee consisting of prominent Greensboro industrialists. The purpose was to discover if a blend of programmed adult basic education and motivational training geared to let the trainees proceed at their own pace could help make them employable.

April 18, 1969: MDC closed the Greensboro center after four cycles, having demonstrated that this type of training is valid for disadvantaged individuals, even including some functional illiterates with no previous history of job stability. Average increases of two tested grade levels were recorded by the trainees. Of the 258 graduates of the center located for follow-up purposes 18 months after the first cycle began, 189 were gainfully employed at salaries averaging well above the federal minimum wage.

July 15, 1969: Based on the experience in Greensboro, the Department of Labor and the Department of Health, Education, and Welfare funded MDC for two more training centers—one in Craven County and one in Asheville. Purpose of this $400,000 program is to test the effectiveness of MDC's training away from the industrialized Piedmont, in a small urban and a rural setting, and to see whether the capability to continue this type of training can be left with a community.

September 22, 1969: MDC's board chairman, Luther H. Hodges, and executive director, George B. Autry, presented Governor Robert W. Scott with a plan for adding the corporation's manpower capabilities to the work being done by the community college system. Mr. Hodges explained that MDC had developed its system with the idea that it would eventually be useful to the community colleges and that, consequently, no services were duplicated. The two MDC officials proposed that the Governor choose one community college for a one-year pilot program to be funded by MDC and the State of North Carolina.

October 3, 1969: Governor Scott called a press conference to announce that Lenoir Community College in Kinston had been chosen for the suggested pilot program. He said that the State would fund the salaries of four manpower specialists to be attached to the college, after training by MDC, and he offered an additional $10,000 to assist in the pilot program. MDC agreed to work with Lenoir toward training and finding jobs for approximately 100 disadvantaged individuals during 1970. At the same time, MDC and the Department of Community Colleges agreed to work together jointly to prepare a plan for spreading this new training throughout the college system in the future.

Lenoir Community College President Dr. Ben Fountain welcomes pilot program as new way to serve needs of more people in the college's area.

"I'm Pleased To Be Here On The Frontier of Tomorrow's Education"

Following is a digest of remarks Governor Robert Scott made during his recent visit to the Lenoir Community College-MDC pilot training program.

Luther Hodges, Jr., came to me last Fall with an idea . . . He said that his organization, the North Carolina Manpower Development Corporation, could help make our excellent community college system even better. MDC had been working with the unemployed and the unsuitably employed locating them, motivating them, finding them jobs with a future.

He wanted North Carolina to choose one community college for a pilot program. I left that choice to Dr. I. E. Ready, the director of the Community College System, who is also a member of MDC's board of directors . . . He chose Lenoir Community College in Kinston.

You know, North Carolina's community college system has a lot to be proud of. In the brief, seven years of the system's life, enrollment has grown from 8,000 to 240,000—that's an increase of 2,911 per cent.

Yet I will be the first to say the job isn't done. The community college system has not fully reached today's disadvantaged individual. The school dropout. The urban job hopper. The displaced farm worker. Men and women, white and black, these individuals need help —and North Carolina needs their productivity.

The Manpower Development Corporation has learned how to reach these individuals—to motivate them to work, to orient them to success, and finally to get them good jobs and help them keep those jobs.

If this new program works as I hope it will work . . . I plan to go to the General Assembly in 1971 with a means of spreading it in an orderly fashion throughout the Community College system. In this way we can make a positive attack on the problem of low per capita income which has plagued North Carolina as long as I can remember.

Understanding laboratory education: an overview

Encounter groups, T groups, and Tavistock —a review article comparing three types of laboratory education, the state of research in the field, and the ethical issues involved

CLAYTON P. ALDERFER

LABORATORY EDUCATION—learning about human behavior through experiences in group activities—is simultaneously an evolving educational technology, a loosely defined philosophy, and a social movement. Most of its practitioners believe that human interactions can be better understood and more effectively carried out, and, as a consequence, more gratifying to the participants. Thus, laboratory education offers the promise of radically changing the way we understand and act in human relationships. Much of this promise has been realized.

But not all of the aspirations have been fully achieved. The failures, the incompleteness, and the sense of even greater possibilities have led many persons to be critical of laboratory education. Some of these criticisms are based on carefully collected data which has been subjected to thorough analysis. Other evaluations have been severely biased and often sensationalistic, whether the conclusions were positive or negative. This article reviews the current status of laboratory education, with an emphasis on identifying major areas of conflict and explaining why the disagreements take the form that they do.

Common processes of learning

The term "laboratory education" refers to a set of assumptions and practices. The various forms of laboratory education include a number of common elements such as acceptance of experience-based learning technology, recognition of the role of emotions in human relationships, and utilization of the small group (10 to 12 persons) as a central component in training designs.

Clayton P. Alderfer is associate professor of organizational behavior, Department of Administrative Sciences, Yale University, and an associate of the National Training Laboratories Institute of Applied Behavioral Science.

The learning laboratory usually takes place on a "cultural island." Participants are taken away from their normal day-to-day activities to a setting where the learning experiences occur. Frequently this new setting is naturally beautiful, but at the very least it is different and thereby provides the participant with both safety from former distractions and a setting that does not necessarily reinforce his usual ways of behaving. A second component of the laboratory involves the use of unstructured or semistructured learning tools. The staff usually attempts to design a set of experiences that serve to heighten certain aspects of human behavior and emotions. Participants learn by becoming actively involved in these activities and by developing skills which allow them to observe both themselves and others during these experiences. A person is asked to engage himself in the unfolding events and later to step back and try to see the patterns in his own and others' behavior. Much of the sense of excitement and high level of emotionality comes from the participant's becoming involved. Experiential learning is based on the assumption that experience precedes intellectual understanding. A continuing challenge in designing laboratories is to achieve that optimal degree of involvement which allows a person to flavor the richness of human interaction but is not so compelling that he loses all sense of what is happening.

A key element in almost all laboratory designs is the small group, typically quite unstructured and serving as a primary group for most participants during the varied laboratory program. One or two staff members meet regularly with the small group to aid participants' learning.

VARIATIONS IN LABORATORY METHODS. Differences among various laboratory methods tend to emerge around the nature of the small group activities.

Three frequently used names for the small groups are encounter groups, T groups, and self study groups. The professional organizations most closely identified with these group labels are, respectively, Esalen Institute, National Training Laboratories Institute for Applied Behavioral Science, and Tavistock Institute of Human Relations. The varied names for the group provide clues about the different nature of the learning experiences offered and of the whole laboratories which utilize the particular type of group. Differences (which tend to be of degree only) include relative focus on intrapsychic, interpersonal, intragroup, or intergroup phenomena; emphasize the personal in comparison to the professional qualities of the staff; and explicitly include the place of thinking in laboratory activities.

Reliable data on the extent of laboratory training are difficult to come by. Table 1 gives estimates, provided by leaders in the three areas, on the number of participants. In actual practice there are many more laboratories than those covered by these estimates. Warner Burke, Director, Center for Organization Studies, NTL, estimates that the 1970 NTL figure represented about 5 percent of the laboratories conducted in the United States. The overwhelming majority are being conducted independently of the NTL by business firms, educational institutions, church groups, and so on. But though the table understates the actual number of participants it does illustrate the rapid growth in laboratory education.

Table 1. Participants in experiential laboratories sponsored by three organizations in the United States

Sponsoring group	Approximate number of participants [1]		
	1962	1965	1970
Esalen	------	600	11,000
National Training Laboratories	900	------	2,400
Tavistock	------	100	250

[1] These estimates were provided by Richard Price and Stuart Miller of Esalen; Warner Burke and Patricia Walton of National Training Laboratories; and Edward Klein of Tavistock.

ENCOUNTER LABORATORIES. The encounter group, the Esalen Institute, and personal growth laboratories in general tend to focus primarily on learning about the individual. Encounter groups tend to produce experiences where a person examines himself in new and different ways, aided by others. A participant in this kind of experience is encouraged to look inward to himself, to become more in touch with his fantasy life. and to become more aware of his physical activities. Part of the emphasis on body movement includes attention to nonverbal communications. A person may learn to attend more fully to his own nonverbal communications, to read others' signs more adequately, and to practice being more effective in his body language. Psychodramatic techniques are often used in laboratories of this kind. Frequently the focus in these exercises is on interpersonal relationships that have been troublesome for people in the past. Other group members are asked to volunteer to be "stand-ins" for or representatives of a key person in a participant's life history. Staff members help set the stage for these encounters, sometimes actively taking part themselves, and almost always leading the discussion and working through of the events after they happen.

Personal growth laboratories contain more components than the encounter group, however. Various exercises in body movement and artistic expression are frequently employed. It is not uncommon for the staff to include members of the performing arts such as modern dance or theater. Some of the key writings which give greater detail, flavor, and rationale for these methods include Schutz (1967), Murphy (1967), Perls (1969), and Rogers (1969).* John Weir is another key figure in the development of encounter laboratories, but to this writer's knowledge he has not written of his ideas or developments.

There can be little doubt that many persons who attend encounter-oriented laboratories have joyful, freeing experiences. The ever increasing popularity of the Esalen Institute and personal growth laboratories testifies to this (Murphy, 1967; Shepard, 1970). Yet these experiences have also been validly criticized. With the focus of the laboratories on freeing people and making them more expressive, little of their learning experience is directed toward examining the consequences of excessive self-expression. Because the laboratories produce potent effects so rapidly, they also tend to spawn disciples very readily (Lakin, 1969). It is not uncommon for participants to start their own groups and "turn on" their friends after as few as one or two group experiences. Within the laboratory itself, participants may be tempted to engage in personality analyses of each other for which they

*Authors and their works are listed in the bibliography following the text.

are ill-equipped (Argyris, 1967).

Staff members tend to be central in the learning processes and often are charismatic figures. They frequently seem magical in the techniques they employ and in the effects they can have on some people (Haigh, 1968). As a consequence some participants tend to copy the manifest qualities of staff members' behavior without careful or thoughtful examination of what or how they are learning.

Another factor which is likely to work against a more critical examination of the learning processes by participants is the tendency for an anti-intellectual bias to develop. While the laboratories are a potent counterforce to our culture's excessive reliance on rational intellective activities, they seem to forget that thinking is also part of the human potential. Encounter laboratories give relatively little attention to how thinking and talking can be reincorporated into a person's behavioral repertoire after he has become more emotionally and physically free.

Although all laboratories find the boundary between education and therapy to be a fine one, perhaps the line is thinnest in the encounter laboratories (Jenkins, 1962). Many staff members for encounter laboratories are also practicing psychotherapists. The new techniques which have developed through encounter laboratories have also had an impact on the practice of psychotherapy, and the latter has affected the laboratories (Burton, 1969).

Both the beauty and the limitations of the encounter approach are captured in the frequently quoted words of Frederick S. Perls:

> I do my thing, and you do your thing.
> I am not in this world to live up to your expectations.
> And you are not in this world to live up to mine.
> You are you and I am I,
> And if by chance we find each other, it's beautiful.

The sense of individuality and freedom in these words is unmistakable. But missing is the recognition that commitments can be reached by mutuality and that a superordinate goal may sometimes require the suppression of certain individual needs in order for others to be expressed.

T GROUP LABORATORIES. The T group (for human relations training) and the National Training Laboratories Institute at its outset were developed to increase the human relations skills which people brought to their leadership, group, and organizational relationships. Bradford, Benne, and Lippitt, the men whose original conversations led to the founding of NTL, were social psychologists who were interested in both research and action (Bradford, 1967). The initial focus of learning was on interpersonal and intragroup phenomena. National Training Laboratories has grown considerably over the years, however, and today it conducts laboratories focused on individual growth and intergroup relations. Nevertheless, the initial focus on interpersonal and intragroup phenomena still conditions much of what T groups and NTL are about.

T group laboratories often tend to be focused on the interpersonal impact that members make on each other. In the unstructured T groups, members examine their leadership, membership, and other roles. They see the consequences of different kinds of leadership styles and attempt to learn about the complex interrelationships between group processes and group effectiveness.

A T group leader acts as a person who is also a professional. He does not deny that he is more experienced and knowledgeable than most group members, but he does not act in such a way as to increase the natural distance between himself and group members. He is likely to discuss his own feelings when he sees that as useful to himself and others. He attempts to establish relationships of mutuality between himself and group members. Recognizing that some members of a group will assume that he is like other key figures in their lives, he is willing to examine the impact of his own behavior on others, but he is also likely to ask group members to concentrate on his group behavior when giving feedback. He is likely to assume that people learn not only from what he says but also from how he behaves.

The T group tradition has produced a considerable amount of empirical research (for example, *The Journal of Applied Behavioral Science*) and theorizing (Bradford, Gibb, and Benne, 1964; Argyris, 1962, 1969). The quality of this work has sometimes been questioned by thoughful critics (Dunnette and Campbell, 1968; House, 1967), with good reason. Frequently laboratory education research has consisted of poorly designed studies from which the investigators have drawn unjustified conclusions. Control groups have often been missing. Measuring instruments have been poorly designed. More recently, investigators have addressed directly the special problems of research

laboratory education and are now utilizing research designs which offer greater promise in terms of the kinds of conclusions one might draw (Rubin, 1967; Harrison, 1970; Alderfer and Berlew, 1971).

Democratic values have played an important role in much of the thinking that has influenced group theory and practice (Whyte, 1953). The impact of democratic practices has undoubtedly been a strong factor in accounting for the wide diversity of practice, the high degree of innovation, and the strong sense of collaboration and commitment experienced by many members of the NTL system. Nevertheless, the profusion of democratic values has also served as a means for avoiding some more difficult issues.

In a long overdue action, National Training Laboratories has recently begun to develop the organizational machinery for accrediting group leaders. For a long time NTL had been unofficially granting credentials to practitioners by publishing lists of those persons who were elected to positions as Professional Member, Associate, or Fellow (Schein and Bennis, 1965). In order not to emphasize its exclusiveness, however, NTL consistently maintained the public position that it was not an accrediting agency. Now the focusing of public attention on the quality of group leadership and NTL's eminence in the field has led the organization to change its course.

National Training Laboratories' initial focus was toward interpersonal and intragroup phenomena. For some time there was a tendency for the key learnings from this level of analysis to be transferred uncritically to larger units, such as intergroup relations and larger social systems. A key paper in this line of thought was by Slater and Bennis (1964), who proclaimed "Democracy Is Inevitable." More recently, Bennis (1970) has revised his original thinking, and NTL has become increasingly involved with intergroup concerns, especially those surrounding racism in our society.

TAVISTOCK CONFERENCES. The self-study group has evolved from a tradition which traces its roots to modern psychoanalytic theory of object relations (Klein, 1959). During World War II, British psychoanalyst W. R. Bion discovered that groups were a useful way to treat psychiatric casualties from the war. His group work led to the writing of *Experiences in Groups* (1959), a book that has become a classic in the field and a key theoretical work for leaders of Tavistock study groups. Although Tavistock theories have evolved from the psychoanalytic tradition, the conferences are directed to learning, not therapeutic goals (Rice, 1965).

Authority relationships form a key element in the learning process of self-study groups. Tavistock staff members, who are called consultants, remain distant and remote in their relationships with group members. They think about their behavior in terms of "staying in role," with the intent of contributing to the group's exploration of relations within the group. In carrying out their roles, the consultants are very punctual in entering and leaving group meetings, dress in relatively formal attire, and intervene in group activity only when they believe it will promote learning. Their statements tend to be metaphorical and they consistently point out how members seem to be relating to them, often as surrogates for other key figures such as parents, siblings, lovers, and the like (Astrachan and Klein, 1961; Redlich and Astrachan, 1969).

Tavistock laboratories also focus on intergroup relations through the use of exercises which ask participants to negotiate among groups in order to make a decision or carry out a task. These activities serve to underline the impact of individual, subgroup, and group boundaries. The analysis of boundaries plays a key role in Tavistock theory and methods. One of the key learnings is the types of fantasy and mythmaking that groups indulge in with respect to each other across group boundaries. A. K. Rice's work (1965, 1969) on laboratory design and on individual, group, and intergroup transactions as boundary crossings is the major conceptual work in this area.

Staff members direct their interventions to the group rather than to any individual. The latter's behavior or statements, however, are assumed to express group concerns unless contradicted by others. Thus, whenever a person speaks in the group he is viewed as speaking for the group and his statement is viewed as representing some element of the group opinion.

Little in the staff behavior allows one to determine the degree to which the interventions cause the study group behavior or merely reflect it. Consultants rarely discuss their own feelings with the group, although they do use their feelings as an important source of data for understanding

group events (Rice, 1965). It might be expected that group members would focus much of their attention on the consultant when he intervenes in the group activity yet behaves in a relatively inaccessible manner. Important questions can be raised about the generality of the learning about leadership that participants achieve in study groups. It is one thing to learn that persons develop vivid and hostile fantasies about persons who appear to be leaders yet deny the role, who behave in distant ways and speak metaphorically about their perceptions of the group. It may be a mistake, however, to assume that reactions of this sort are representative of typical reaction to authority figures regardless of how they behave.

Tavistock consultants do not suggest that their behavior is a model for group members to follow. Yet a question can be raised as to whether modeling occurs nonetheless. There is research to support the notion that modeling or imitation is a general human learning process (Bandura and Walters, 1963). If modeling does occur in study groups, then it would appear that the Tavistock style of study group would teach participants to be leaders who do not share their feelings, remain personally distant from the group, talk in metaphors, focus attention on themselves by their mode of intervention, and hold quite strictly to the prescribed definition of their roles.

This writer has serious questions about whether these types of learning are very useful for small group effectiveness. However, there are times when learning of this kind is realistic. Leaders of large social systems cannot be seen regularly by more than a few members. They frequently serve as spokesmen for the group. To come to terms with leaders in this kind of role, group members have little choice but to rely on their fantasies and therefore to project and transfer their reactions from prior relationships. Learnings from study group and intergroup activities in a Tavistock laboratory can be very enlightening with regard to multiple group functioning in large scale social systems.

Comparison of laboratory approaches

The primary learning and dangers differ among the three approaches to laboratory education. For encounter group laboratories, the primary target is individual expression and artistic creativity. A danger in this approach is that participants may learn to act out their impulses without realistically considering the consequences of their behavior for themselves and for others. T group laboratories primarily aid learning about mutuality, trust, and collaboration. There is a danger that democratic values and behavior may be applied in situations where they are not realistic or appropriate. Moreover, differences among individuals with regard to task or professional competence may be ignored because they tamper with the norm that everyone is equal. Tavistock laboratories promote learning about authority relationships and the functions of group boundaries. It is possible that consultant behavior in the study group may become a model for nonmutuality when this kind of behavior is neither necessary nor effective.

The common theme in the criticisms of each of these approaches to learning by experience is that the particular approach may lead to unwarranted generalization. Learning which evolves from a particular approach does not apply to all situations. At first glance it would appear that this caution is clear to understand and easy to apply. But the learning processes of laboratory education do not lend themselves readily to a norm of moderation. Overattention to concerns about being too self-expressive can prevent a person from taking the risks which would enable him to become more free and spontaneous. Fear of being overwhelmed by a pseudodemocratic horde may prevent a person from exposing enough of himself to really find out what can be gained by sharing more of himself with the group. The need to feel competent or free of tension may inhibit a person from exposing himself to his fantasies about distant leaders or to engage in the turbulent processes of intergroup negotiations. It is difficult to write critically about the different approaches to laboratory education without unintentionally colluding with the very human processes—fear, hostility, fantasy, and so on—that prevent persons from learning about themselves and their complex relations with others.

The kinds of laboratory education described in this article represent efforts to apply behavioral science concepts to increase learning about human relationships. Each of the laboratories exists as an educational setting. However, although all approaches aim to transfer learning to nonlaboratory settings, an active role for the staff in promoting transfer typically ends with the con-

clusion of the laboratory. Additional developments in the direct utilization of behavioral science knowledge for organizational change through the use of experiential methods will be the subject of a future article.

Public and professional criticism

During the past several years, a number of articles have been devoted to laboratory education, both in widely circulated newspapers and magazines and in professional journals. Not all of this coverage has been comprehensive or unbiased. Some has been blatantly slanted and inaccurate. The purpose of this section is to alert the reader to some of the forms that public and professional criticism has taken and to caution him against putting too much credence in sensationalistic accounts.

NEWSPAPERS AND MAGAZINES. The front page of the *Wall Street Journal* on July 14, 1969, carried a story with the headline, "Some Companies See More Harm Than Good In Sensitivity Training—Frank Exchanges Sometimes Hamper Work; Sessions Can Produce Breakdowns—A Tough Boss Turns Meek." The lead paragraph was, "Last year a big New York consumer products company sent Mrs. D, a product manager, to a week-long sensitivity training program. She got so sensitive she quit the company." In this article, a number of key academic authorities were cited to support the author's slant, but the full range of professional opinion was not presented. In a number of instances the writer obtained opinions from persons who had participated in symposia or debates on laboratory education but chose to present only the critical side of the controversy. He cited Marvin Dunnette and John Campbell (1968) on the subject of research findings but did not include Chris Argyris (1968) who had raised questions with them about research procedures. Warren Bennis (1966) has written extensively about the conditions under which laboratory methods are likely to result in constructive organizational change but nowhere was his work included.

In contrast to the above article, *Today's Health* featured a discussion of laboratory education from a more balanced perspective. The title of this article was "Sensitivity Training: Fad, Fraud, or New Frontier." The lead paragraph in the piece was, "Here's a comprehensive, up-to-the-minute look at a new dimension in human relations—its problems (misguided do-gooders), its bizarre aspects (T group bums looking for thrills), and its outlook (potential for good)." This article, too, had a bit of sensationalism, for it only included pictures of encounter labs where the participants were engaged in active nonverbal behaviors. But for one who was willing to read the text, author Ted J. Rakstis provided a sampling of informed opinion, both inside and outside the medical profession as well as inside and outside the laboratory education profession. Cautions, criticisms, and potentials all received attention and discussion. The reader looking for a final definitive opinion would not be satisfied by Rakstis' piece, but one looking for a delineation of the issues so he could make more informed choices would be aided by it.

PSYCHIATRISTS. An issue on which one might expect psychiatrists to agree concerns the impact of laboratory education on mental health. They do not, and the December 1969 issue of the *American Journal of Psychiatry* shows a broad range of differences. At one extreme, there is the paper by Ralph Cranshaw who asked, "How Sensitive is Sensitivity Training?" He reported three cases of psychiatric problems which arose in conjunction with persons attending laboratory programs, and he noted that his colleagues had encountered similar cases. He argued that the responsibilities of laboratory trainers had not been fully defined and implied that the practitioners of sensitivity training could be justly accused of irresponsible experimentation with human beings. He charged that education in the form of sensitivity does not include the concepts of freedom, truth, and empathy in its operation. In his conclusion he stated, "The medical profession can say, to those who will listen, that sensitivity training is insensitive to the individual, for he is not seen as a whole person."

There were some very questionable qualities about the Cranshaw paper. With an n=3 sample the writer seemed willing to generalize to the entire operation of sensitivity training. One of the three cases was under treatment with Cranshaw prior to attending the laboratory which preceded his hospitalization for emotional difficulties. Cranshaw did not raise such questions as whether the hospitalization might have occurred regardless of the laboratory experience, whether his own efforts at treatment might have hastened the need for

hospitalization, or whether the hospitalization was a constructive or destructive experience for the client. When arguing that freedom, empathy, and truth are not part of the code of operations for sensitivity training, Cranshaw was simply not fully informed. Key writings in the field by Argyris (1962), Bennis (1966), and Bradford *et al* (1964) have consistently emphasized these values.

The way Cranshaw approached his critique was unfortunate because the issues he raised with regard to possible harm to participants, areas of responsibility among trainers, and the necessity for free choice for participants are important. They can be handled adequately only by continually confronting them. The errors in logic and fact in his presentation, however, probably reduce the kind of positive effect which his points could have.

At the other extreme of psychiatric reaction is the paper by Cadden and others (1969), who reported their experiences with a voluntary program of laboratory education for incoming medical students. They found no evidence that the group experiences precipitated emotional illnesses. In contrast, they noted that the laboratory experiences aided several students in becoming aware of their need for psychiatric consultation. The overall need for psychiatric consultation among first year students, however, was reduced in comparison to preceding years because the groups made it possible to handle certain situational crises more effectively. They also noted that the laboratory program seemed to improve student-faculty communication. The contrast with Cranshaw's reactions could hardly be more marked.

There is no reason to assume that only one of the two critiques is accurate, however. Both refer to rather specific cases. One underlines the dangers; the other shows realized potential. It would be a serious error to assume that because some laboratories are poorly conducted or some individuals poorly handled, all similar activities share these outcomes. It would be equally unfortunate to assume that because one system found benefits for individuals and groups, all systems will also benefit without careful planning and competent execution.

T GROUP TRAINERS. The inhouse controversies which were featured in the Landmarks issue of *The Journal of Applied Behavioral Science* (1967, 3(2)) focused on the differences in approach to laboratory education. In the one case, Argyris (1967), who has consistently contributed to group practice, theory, and research, raised issu with the encounter group wing of NTL. He fou many of the trends in personal growth laboratori to be running counter to the initial goals a concepts of the National Training Laboratorie Several NTL trainers responded to Argyris' issue but there was little consensus among their r sponses. Some, such as Kingsbury (1967) a Shepard (1967), sharply disagreed with hi Others such as Coffey (1967) and Work (196 essentially agreed with him. Those who disagree were more active in conducting personal growt laboratories than those who agreed.

In the same edition, Bass questioned whethe the T group with its focus on openness an collaboration provided a full enough range o learnings to permit transfer to organization leve issues. He was particularly concerned with learn ings about competing interest groups, distan leaders, and organizational demands which some times require suppressing individual and smal group interests. Few of the commentators on th Bass paper agreed with all of the premises of hi arguments, but most agreed in whole or in pa with his general conclusions.

Major areas of disagreement emerged within th NTL tradition when the interpersonal and intra-group focus became more oriented to the individua and when the inadequacies of using only collaborative models in large social systems becam apparent. The inhouse controversies closely paralleled the various emphases featured among the different types of laboratory education programs. The potential payoff from constructive dialogue among practitioners from the various orientations is high, because the strengths and limitations of the approaches are often complementary.

Empirical research and ethical questions

Most thoughtful discussions of laboratory education pay some attention to what has been or can be offered by empirical research. Many of the controversial issues could be clarified, differentiated, and possibly even resolved if the appropriate empirical studies were carried out. Ideally, research produces unambiguous answers to precisely defined questions. Practically, this rarely happens. During the past several years there have been two independent efforts to review the research literature on laboratory education

(House, 1967; Campbell and Dunnette, 1968). These reviews reached some, though not identical, agreement in their conclusions. However, several of the commentators on laboratory education have written as if there was no research or that one could not draw conclusions from it (Gottschalk and Pattison, 1969; Rakstis, 1970).

House (1967) stated his major conclusions as follows: "It has been shown that T group training is not only capable of inducing anxiety, but the anxiety is an intended part of the training. Such induced anxiety may have the very unrewarding effect of unsettling, upsetting, and frustrating those subjected to it. The method may also have the intended effect of inducing more consideration for subordinates, less dependence on others, less demand for subservience from others, and better communication through more adequate and objective listening."

Campbell and Dunnette (1968) concluded: "The evidence, though limited, is reasonably convincing that T-group training does induce behavioral changes in the 'back home' setting. . . . It still cannot be said with any certainty whether T groups lead to greater or lesser changes in self-perceptions than other types of group experience, the simple passage of time, or the mere act of filling out a self-description questionnaire. . . . "

House (1967) laid greater emphasis on the role of anxiety and tension in the learning process of laboratory education than Campbell and Dunnette (1968) did. Meanwhile, Campbell and Dunnette (1968) gave more attention to the inadequacies of current research designs than House did. They also differentiated more precisely than House between behavioral and attitudinal changes as a result of laboratory education. Reading House, one would probably feel relatively sure that important changes came from laboratory education, but the reader would also be encouraged to examine whether the costs of the changes were worth the payoff. Reading Campbell and Dunnette, one would probably be less certain about the type of changes, especially with regard to attitudes, that could be credited to laboratory education. One would also be alerted to many of the methodological errors that have been made in laboratory education research.

Elsewhere, this writer has commented on the House and Campbell-Dunnette reviews (Alderfer, 1970). House tends to underemphasize the fact that most important or significant change processes include anxiety. The key question concerns whether the participants and staff are equipped to deal with the tensions effectively, not with whether they should exist. Poor instruments and inadequate controls do contaminate many laboratory education research studies. It is also true, however, that studies frequently had different sources of invalidity and yet reached the same conclusions. Studies with better designs had ways of checking sources of error even though they could not completely control them. My conclusion, therefore, was that the two reviews were conservative both with respect to the potential dangers in the methods and with respect to the kind of payoffs that could be expected.

Most of the research reviewed to date has been directed toward seeing whether T group laboratories result in behavior and attitude changes for participants when they return to work settings. There has been far less research, if any, on similar or related questions for encounter and Tavistock laboratories. Much of the public concern over laboratory education has been tied directly or indirectly to personal growth laboratories. The lack of empirical research on these very potent learning settings should be changed. A similar point applies to the Tavistock laboratories, and there are indications that research of this kind is being carried out (Astrachan and Klein, 1970).

Lakin's (1969) delineation of ethical issues in laboratory education offers a paradigm for thinking through many of the needed researches. We need to study more about the processes that lead persons to attend laboratories, including questions of how to identify persons who might be harmed and who are most likely to benefit. The work of Steele (1968) and Rubin (1967) offer promise in this direction, but it is only a bare beginning. We need to know more about the effect of various design components, staff behavior, and laboratory processes, such as that offered by the research of Argyris (1962), Culbert (1968), Harrison and Lubin (1965), Bolman (1970; 1971), Schmuck et al (1969), Lubin and Zucherman (1969), and Alderfer and Lodahl (1971). But the number of questions that could be addressed is much greater than the answers so far provided. Quite a few studies have been addressed to assessing the outcomes of laboratory education, but still more with better designs and instrumentation are needed. Especially important are questions with regard to changes in interpersonal

and intergroup behavior as a result of laboratory programs. What we know about laboratory induced changes in behavior exists almost entirely at the individual level.

Both the critics and the advocates of laboratory education are people. They have their own unique combinations of needs, values, abilities, and personal styles. They participate in interpersonal relationships with each other. They belong to overlapping and competing groups. Their reactions (including this author's) to laboratory education are bound to be influenced by these factors.

Questions of knowledge, professional competence, and ethical behavior are closely intertwined. When it is well known that a particular behavioral pattern is harmful, a professional who consciously or unconsciously undertakes such a pattern should be questioned on ethical grounds. So often the issues are not clear, however. Sometimes conservative members of a profession or of a competing profession raise ethical questions about innovations because they fear that they will soon have to revise or change some of their own well estab lished ideas or behavior if the new concepts a proven valid. The value of innovation for i own sake should never be a reason for infringin on the freedom or individuality of human being Nor should the inertia of tradition serve to bloc the responsible experimentation that is so nece sary if we are to become more effective in copin with the many social problems that we face in to day's world.

These issues define some very fine lines to draw Reasonable and competent professionals have dis agreed and will continue to disagree on specifi cases. The important conditions for public welfar and for professional growth are that issues o professional practice be subject to continual ex amination by those who are equipped to do so that theory development and empirical researc go along with new developments in professiona practice, and that the outcomes of these dialogue be shared among the professions and with th public. □

MANPOWER RESEARCH STUDY SUMMARY
U. S. DEPARTMENT OF LABOR / Manpower Administration

M – Training

1970

MOTIVATIONAL DETERMINANTS OF PERFORMANCE IN TRAINING

Manpower training programs have progressed considerably further in mastering techniques of skill development than in coping with the problems of trainee motivation equally vital to program success. Although there is common recognition that motivation is an essential determinant of training performance, the specific nature of motivational processes and how they can best be influenced or adapted to are still somewhat obscure. Motivational issues have been particularly ill-defined with reference to disadvantaged persons whose rapid inclusion in manpower training programs has outpaced the advancement of knowledge through research and experimentation.

Illustrative of the potential benefits of motivational research, and psychological research more generally, are the findings of a project recently completed for the Manpower Administration of the Department of Labor.[1] This investigation, consisting of a series of four interrelated laboratory-type experiments conducted in training settings, was designed to test alternative strategies foı influencing the motivation and training performance of disadvantaged youth and adults.

Basic to the rationale of the study was the general assumption that training programs have not realized their full potential because of their failure to provide trainees with the experience of success (reinforcement) at vital points in the training process. More specifically, the project was built on the assumptions that (1) disadvantaged youth, by virtue of past experience, are prone to have low self-evaluations; (2) this negative self-image has an adverse effect on motivation to perform; and (3) the selective and judicious application of social reinforcements (i.e., evaluative information) can enhance both self-image and task performance.

The study involved the experimental manipulation of three dimensions of reinforcement: Types of reinforcement (Is it more efficacious to reinforce the person per se or the correctness of his performance? to provide material reinforcement or verbal reinforcement?); sources of reinforcement (Is reinforcement more effective when administered by peers or by an authority figure?); schedules of reinforcement (What are the relative effects of positive and negative feedback, and of varying frequencies of reinforcement?).

In all of the four project studies, two major sets of dependent variables (measures of effect) were employed: Improvements in task performance; and improvements in self-image, presumed to mediate changes in motivation to perform the tasks.

The range of tasks selected was designed to simulate as far as possible the kinds of activities that might actually be performed in skill training programs and to permit greater generality than is normally possible in laboratory investigations. These included word recognition, visual perception, motor coordination, and perceptual motor skills. The experimental arrangements also included an ambiguous evaluative context, to preclude the possibility of an individual's evaluating the quality of his performance and allowing the experimenter to influence his perceptions of how well he was doing.

Two different types of self-image measures were used. A standardized self-concept scale provided a measure of the individual's beliefs about himself. An assessment of self-esteem (the individual's evaluation of himself) was obtained through a specially constructed Interpersonal Perception Questionnaire.

Finally, in order to test the assumption that an individual's response to given conditions of reinforcement is a function of past reinforcement experience, a questionnaire was administered to obtain historical data relative to typical evaluative reactions of parents and peers in a variety of situations involving home, school, and social activities.

Study No. 1–In this study of female Negro nurse aid trainees the reinforcement procedures had much more impact on self-image than on actual task performance, with praise of person proving to be more effective than praise of performance. Moreover, less frequent reinforcement was found to be generally more effective in enhancing self-image than more frequent reinforcement.

Study No. 2–The subjects in this study were young men (most of whom were Negroes) enrolled in a Skills Center auto mechanic training program. As in the first study, self-image was more affected by reinforcement variations than was actual task performance. Also, material rewards (for example, cigarettes or candy) were somewhat superior to verbal ones, although this difference in relative effectiveness was in turn a function of the individual's need for social approval and the favorableness of past reinforcement experience.

Study No. 3–Negro high school students participating in a summer vocational exploration program were the subjects of this experiment. As with the previous studies, reinforcement conditions were found to be more relevant to self-image than to task performance, with a general tendency for peer reinforcement to be more potent than experimenter (authority) reinforcement and praise more effective than criticism.

Study No. 4–In this experiment, conducted with female high school students, neither peer nor experimenter reinforcement alone affected the persistence with which subjects worked at an assigned task. Subjects did persist longest, however, when they received peer group reinforcement and when the experimenter (authority figure) was absent.

These are, of course, only a few highlights of the major study findings. However, they can suffice as a backdrop for tracing at least some limited implications for social reinforcement theory, future research, and training strategy.

With respect to theory, it is reasonably clear that the findings are more easily explained by a model that stresses the appropriateness or relevance of evaluative feedback than by those theories that concern themselves only with amount of reinforcement. What appears to be at work is a judgmental process by which individuals react differentially to particular rewards as a function of variations in their reinforcement history. Therefore, the

Bass, *The Role of Social Reinforcement Parameters in Improving Trainee Task Performance and Self-Image*, Department of Psychology, Wayne State University, Detroit, 1969. This study was done under Contract No. 81-24-66-04 with the Office of Policy, Evaluation, and Research of the U.S. Department of Labor's Manpower Administration. Copies of the report may be purchased from the Clearinghouse for Federal Scientific and Technical Information, Springfield, Va. 22151 (Paper copy, $3; microfiche, 65 cents.) Specify Accession No. PB-187700 when ordering.

most effective reinforcer for a given person is that which has optimal credibility–in other words, is perceived by him as appropriate to the present situation.

In the domain of research, it is essential that further study be made of the process by which social reinforcement is translated into effective performance if theory is to be refined and alternative models selected or rejected. Future research should be designed, for example, to determine the kinds of past reinforcement experiences that condition the effects. Clearly a much more precise specification of antecedent conditions along with the manner in which they interact with different kinds of feedback is a requisite for the application of reinforcement techniques to actual training programs.

Research should also have as its goal the clarification of relationships between self-image and task performance. This investigation assumed that reinforcement effects changes in both variables and that self-image mediates changes in performance. Although the dual effect hypothesis was partially confirmed, the mediation hypothesis was unsupported. But the logic of a relationship between performance and self-esteem remains strong, and the dynamics of it need further clarification.

Finally, investigations should determine the extent to which the findings of largely laboratory research can be generalized to other settings and conditions. Studies should determine, for example, the relative effectiveness of Negro and white reinforcing agents, both as authority figures and peers. Research might also be developed in actual training situations where performance in the program itself can be used as the principal change variable. Such research could then be extended over time to gauge the stability of change after assignment to a job. The question of persistence of change as a consequence of reinforcement treatments seems to be particularly worthy of investigation.

While the major significance of the present study is its stimulus to further research, a few cautious suggestions might be made regarding the application of reinforcement in actual training situations. Generally, it seems likely that disadvantaged trainees will benefit most from programs if their self-esteem can be developed at an early point in the training process. These preliminary research findings also suggest that moderate praise of the individual via peer group reinforcement can contribute to improvement in both self-image and performance. It must be remembered, however, that the durability of such changes has yet to be established and that additional research is essential to specifying, with greater precision, the kinds of success experiences that are beneficial for individuals of varying backgrounds and reinforcement histories.

AVAILABILITY OF THE FULL REPORT

The full report is on file at nearly 100 libraries located in 72 different cities. For a list of these libraries write to the Manpower Administration, U.S. Department of Labor, Washington, D.C. 20210. The full report may also be consulted at the offices of the Regional Manpower Administrators at the addresses listed below.

CEP Project Exploits City Personnel Needs

The N.C. Manpower Development Corp.'s Rural Concentrated Employment Program has tied in with the City of Lumberton in a cooperative project to develop personnel for two vital municipal services—law enforcement and sewage treatment plant operation.

The project aims first at filling these career-type jobs with CEP recruits drawn from among the area's unemployed and under-employed. But MDC also sees the project as a model for developing career jobs in other small cities. It expects the Lumberton experience to produce useful insights into ways to create Public Service jobs with a future.

Lumberton has typical small city personnel problems. It faces demands for more and better services for its 17,000 people. Despite efforts to keep its municipal pay scale competitive with private industry in the region, Lumberton has trouble attracting full qualified applicants for jobs in its service departments. And the city lacks the resources for extensive recruiting and training to up-grade the marginal applicants who make up a large proportion of the labor pool in Lumberton's predominantly rural region.

Through its Job Experience component, the CEP is giving Lumberton the recruiting, support and training capacity to tap this labor pool for select job areas. Although the training is just beginning, both Lumberton's personnel director, Wallace O'Neal, and Police Chief Wilbur Lovett are optimistic about the prospects. The courses are promising.

The six-month police cadet training course promises obvious advantages over the learn-by-doing method used by so many small cities to train new police officers. During the six months, cadets will spend 20 hours a week in uniform, performing non-hazardous police duties and familiarizing themselves with the workings of the Lumberton department.

They will get 10 hours a week of police-conducted classroom instruction. They will spend 10 hours a week in CEP-conducted classes in personal development and/or academic work (where necessary to bring cadets up to standards for police employment).

The cadet class also promises Chief Lovett the in-

MDC's CEP

The N. C. Manpower Development Corp.'s Rural Concentrated Employment Program serves a six-county area of Southeastern North Carolina from CEP headquarters in Lumberton. In addition to normal job placement goals, the $1.3 million-a-year MDC Rural CEP operation is committed through its contract to stress "innovative" projects useful in MDC's independent manpower research and development.

New plant needs staff. . .

creased numbers he has sought for his 34-man force. And it promises a significant increase in minority representation which can be invaluable to a department serving Lumberton's tri-racial community of whites, blacks and Indians.

Among the seven police cadets recruited by the CEP's Alvin Hill are two black men, one black woman, one Indian, one white woman and two white men. If all seven make the grade, effective strength of the department could be increased by more than 20 per cent, black representation could be doubled, and Lumberton could have its first policewomen. What's more Chief Lovett would have the personnel he needs to assign officers to specialized duties which an under-manned department cannot take on.

Cadets aren't city employees. They are paid ($1.60 an hour) through the CEP. They aren't guaranteed jobs after six months. However, Chief Lovett sees no job-hunting problems for these who do well in training.

(Continued On Reverse Panel)

Patrol Captain explains meter procedure to Cadet Ola Manning. . .

(Continued From Inside Panel)

Job prospects for successful trainees in wastewater treatment are as good or better. Lumberton is one of a dozen small cities and towns in Southeastern North Carolina that will open their first sewage treatment plants in the next year or so. None has State-certified operators available to run those plants now. Pressure to clean up pollution has concentrated on treatment plant construction. No comparable effort has been made to develop State-certified plant operators who are in short supply throughout North Carolina.

So the Lumberton training project is expected not only to staff Lumberton's first plant when it opens next year, but to supply operators for new plants in surrounding cities and towns as well. Trainees will be prepared for examination for their Grade I wastewater certificates through a combination of classroom work and job-familiarization in the Lumberton facilities. Once certified in Grade I, operators can qualify for examination for higher certification through job experience.

Equipping unemployed or under-employed men and women for jobs where the work will serve, in effect, as further training is the key to success in the broad aims of the Job Experience component. MDC planners believe a variety of small city service jobs can be exploited to this way to develop personnel useful to cities like Lumberton and to private employers.

For example, Hill points to turnover among heavy equipment operators in Lumberton's public works operations as evidence of another area where short-term training could begin developing personnel in demand among private as well as public employers in the region. By carefully exploiting opportunities like these throughout the six-county CEP area, Hill thinks the CEP can develop significant career opportunities for its recruits and provide valuable evidence of how to keep proposed Public Service Employment programs from merely creating dead-end jobs.

THE EFFECT OF SOCIAL INSTITUTIONS ON RETRAINING IN THE SOUTH

J. Earl Williams*

In 1960 the South[1] had 21.7 percent of the population and 20.4 percent of the national labor force.[2] Surprisingly, during the period 1957-1963, the tabulations of the southeastern states indicate that most of them had a lower rate of unemployment than the national average.[3] Thus, even though the South's percent of the labor force remained fairly constant through 1963, only 17.6 percent of the total unemployment in the nation was officially recorded in the South during 1962. Consequently, when the 1964 Manpower Report of the President indicated that 18 percent of the trainees approved for MDTA training programs through December of 1963 were in the Southeast,[4] it appeared that the South was matching the rest of the nation in meeting retraining needs.

---

*Professor of Economics, University of Tennessee, Knoxville, Tennessee.

[1]From the standpoint of tracing common ideas and standards that might affect retraining, it is best to choose what is commonly described as the Southeast. This includes all of the states of the Old Confederacy except Texas and adds the border state of Kentucky. Thus, the Southeast will include Alabama, Arkansas, Florida, Georgia, Kentucky, Louisiana, Mississippi, North Carolina, South Carolina, Tennessee and Virginia.

A BENEFIT-COST ANALYSIS OF MANPOWER RETRAINING

Gerald G. Somers
University of Wisconsin

and

Ernst W. Stromsdorfer
University of Tennessee

INTRODUCTION

Government-sponsored retraining of the unemployed may be viewed as the major development in U.S. labor market policies of the 1960's. In addition to recently enacted state and local programs, retraining has been assigned a central role in such federal legislation as the Area Redevelopment Act (ARA) (1961), the Manpower Development and Training Act (MDTA) (1962), the Trade Expansion Act (1962), amendments to the vocational education system and to the MDTA (1963), and the anti-poverty program of 1964.

The emphasis on retraining has been prompted primarily by the relatively high rates of unemployment in the American economy during the past seven years. However, new skills to fill expanding jobs are even more important in an economy moving toward full employment. This need, together with the growing interest in general and vocational education, ensures that the emphasis on government-sponsored retraining is likely to increase rather than diminish in the coming years.

A SUMMARY OF THE MANPOWER DEVELOPMENT AND TRAINING ACT OF 1962, AS AMENDED

U. S. DEPARTMENT OF LABOR • W. Willard Wirtz, Secretary • MANPOWER ADMINISTRATION

Manpower — Training —
(Research)

THE NORTH CAROLINA
RESEARCH COORDINATING UNIT IN OCCUPATIONAL EDUCATION

School of Education
North Carolina State University
Raleigh, North Carolina

Purpose:

The overall purpose of the proposed research coordinating unit is to improve the climate and circumstances for the production of research and to close the gap between research and practice in occupational education. A major function will be the dissemination of research findings.

One of the most pressing problems in occupational education in North Carolina is for staff and other resources to encourage and to assist in the production of more and better research and to secure more effective use of research findings by policymakers, administrators, and teachers of occupational education. There is a need for more research. There is a gap between occupational education research and occupational practice.

The purpose of the proposed research coordinating unit is, therefore, to encourage and to coordinate the production of occupational education research and its utilization in developing solutions to problems in occupational education programs, in diffusing these new approaches to other practitioners, and in adopting new approaches in local and area school systems. More specifically, the proposed research coordinating unit will:

(a) Stimulate research in occupational education.

(b) Identify problems for research.

(c) Develop a system by which national, state and local data on occupational education my be organized and made available to researchers, policymakers, and practitioners.

(d) Maintain communication between people who are working in occupational education programs and research workers and encourage the development of additional mechanisms to facilitate activities along the research-action continuum.

(e) Assist in conducting training programs on activities involved in the research-action continuum for state-level research workers, policymakers, administrators, program specialists and for local and area personnel.

(f) Provide consultant services in state, local and area research and developmental activities.

Location:

The unit is located in the School of Education, North Carolina State University. The School of Education serves as the official teacher education agency for the State Board of Education in the fields of Agricultural Education, Trade and Industrial Education, and Occupational Information and Guidance. Presently, there are 25 faculty members at North Carolina State University directly engaged in the production of occupational education research. These faculty members are located in the several departments in the School of Education and in Economics and Sociology.

Organization:

The unit is organized as part of the School of Education of North Carolina State University under university administration and control. In addition to the unit staff an Advisory Council has been established consisting of representatives from:

The School of Education, North Carolina State University

The Division of Vocational Education, Department of Public Instruction

The Department of Community Colleges

The Center for Research, Development and Training
in Occupational Education, North Carolina State University

The North Carolina Employment Security Commission

Personnel:

The unit director has a background of research experience in vocational education. Two assistant directors will be employed. One will be responsible for the research services; the other assistant director will be responsible for the diffusion of research findings, and will prepare written materials for publication.

The Director of the Division of Vocational Education in the State Department of Public Instruction has assigned his associate director to the RCU on a one-fourth released time basis to serve as a research associate.

The Department of Community Colleges has also appointed an individual on a one-fourth released time basis to serve as a research associate. One full-time secretary has been employed.

The Dean of the School of Education serves on a part-time basis.

The Division of Vocational Education, the Department of Community Colleges, and the School of Education at North Carolina State University will use other personnel on a released time basis to assist in initiating, stimulating, coordinating, and utilizing research.

RETOOLING THE MIND*

by NEIL W. CHAMBERLAIN

The continuing explosion of new knowledge is so basic to our entire economic life that "it is upsetting many of the traditional relationships in our social system," says Neil W. Chamberlain, professor of economics at Yale. In the article which follows, Professor Chamberlain suggests methods whereby education may become a lifetime process.

On our home front we have been preoccupied for some time with problems of jobs and job security, automation, and unemployment. The issues which dominate our thinking relate to the impact of income, unemployment, health, education, and age on a person's place in his culture. But only in the last few years has there come a growing recognition that many of these problem areas cannot be set right by legislative action touching on them directly, or by private initiative on the part of managements or unions, acting either independently or jointly. These can help, but they cannot cure.

The fundamental change which has taken place in our culture is a speeding up of the rate of accumulation of knowledge, an acceleration so much in excess of what we have been accustomed to that it is imposing unexpected strains. The number of people receiving higher education has increased enormously, and more of them are devoting their time to the pursuit of new knowledge, financed by ever growing sums from public and private treasuries. The productivity of the knowledge-makers is being augmented by better-organized and better-equipped facilities in an expanding number of specialized research units and institutions. The stream of new knowledge has swelled into a flood, but we act as though the environment had not changed at all.

B. DESCRIPTION OF ACTIVITIES

This section of the proposal for the continuation of the Center for Research, Development, and Training in Occupational Education (1) presents a resume of the work accomplished or to be accomplished by the Center during the initial period of approval ending December 31, 1966, (2) presents the proposed program for the continuation of the Center, and (3) describes the administration and organization of the Center.

RESUME OF ACCOMPLISHMENTS OF THE CENTER

The initial program of the Center was centered on two major activities:

1. The development of a program of research and development on fundamental problems of occupational education, organized in six subject matter areas.

2. The development of a program to upgrade training and education through conferences and short courses for lay leaders, vocational education personnel, and researchers.

A brief resume of the work accomplished or to be accomplished at the Center during the initial approval period ending December 31, 1966, is presented in this sub-section of the proposal.

The Research and Development Program

The initial proposal for the Center provided for major concentration on the research and development program, which was divided into six subject matter areas. This provision enabled the Center to draw heavily on the research background and personnel of the cooperating and participating departments and the disciplinary resources represented by these departments. Reports of 16 research projects will be issued at the termination of the initial approval period. Developmental programs have been started or are in the process of being started in two areas, and other developmental programs are projected as projects are completed. Resumes are presented by subject matter areas.

THE IMPACT OF RAPID TRANSIT ON METROPOLITAN ATLANTA

Corridor Impact Study

March, 1968

Inaugural run of new Metroliner service was saluted by VIPs and Navy band at Washington's Union Terminal.

EV – Transportation Pub facilities

TRANSPORTATION

Do fast trains have a real future?

Penn Central's Metroliner starts on New York-Washington run that may show whether high-speed trains can make grade with U. S. passengers. For now, emphasis is on convenience

Northeast Corridor Metroliner trains went into service between New York and Washington last week on the Penn Central RR. Although the Jan. 15 inaugural date was more than a year behind the original schedule, the public didn't seem to mind.

First-day passengers were simply grateful that the train was on the track at last. The Metroliner isn't the high-speed cannonball express that some might have expected, but it does beat the regular trains on the 226-mi. run by 36 minutes. It makes it from New York's Penn Station to Washington's Union Terminal in 2 hours and 59 minutes.

Comfort. But more important for now, it offers the traveler a fast, comfortable alternative to the crowded airlines and highways in the eight-state supercity of the Northeast Corridor. Higher speeds may come later.

Said a college professor on his way to a Washington conference: "I'm tired of being stacked up at both ends and in the middle. I think I'll be able to relax on this train."

A suburban housewife who boarded the Metroliner in Philadelphia on her way to visit friends in Washington said that the train was a "delightful surprise." She thought that if the standards of service remained at opening-day levels, she would probably make the trip more often. She finds driving tiring, doesn't like to fly, and doesn't like the "old trains" either. "This is what trains ought to be like," she said.

Said outgoing Transportation Secretary Alan S. Boyd at opening-day ceremonies: "The advice of the press and public has been a resounding 'go!' The train is popular even before it begins service. If a measure of this popularity translates into ticket sales, its future will be a good one indeed."

Preview. The service that was opened to the public Jan. 16 with one round trip daily between New York and Washington was an abbreviated foretaste of one of two demonstration projects authorized by the High-Speed Ground Transportation Act of 1965. The other will test turbine-powered trains between New York and Boston.

Under a contract signed by the pre-merger Pennsy and the federal government in April, 1966, the Metroliner service will be partially subsidized as part of a study of the effect of high-speed ground transportation on intercity travel systems. But the two-year demonstration project will not begin officially until a majority of the 50 cars ordered are on hand.

At this point, only 12 cars are

Mobile phone lets Metroliner passengers make or receive calls while en route.

available, and only six are in regular service. The present train has two 32-seat parlor cars and four 60-seat snack-bar equipped coaches on its round trip. Eventually, there will be 22 trains a day, with half-hourly departures most of the day between New York and Philadelphia and hourly to Washington. Seats will be reserved. Typical fares, including a Metroliner surcharge, will be $19.90 first class or $12.75 coach between New York and Washington.

Faster future. Although the Metroliner has been popularly identified as America's answer to Japan's high-speed Tokaido line, its appeal—initially at least—will not come from exceptionally fast running times. It will average 75 mph, against 103 mph for the Tokaido trains.

Later, if funds estimated as high as $250-million can be found to straighten curves, eliminate grade crossings and tunnels, and complete a track improvement program already begun, the Metroliner may run closer to its design maximum of 160 mph than its present top operating speeds of 110 mph. But for now, its big selling point is in offering the traveler a way to avoid the Northeast Corridor's increasing air and highway congestion.

These problems are not unique to the northeastern U. S., nor are Metroliners the only representatives of a new generation of passenger trains designed to alleviate them. Ready for service between New York and Boston—as soon as Penn Central and the Transportation Dept. agree on a contract—are two turbine-powered three-car trains designed by United Aircraft Corp.

Temporarily out of service are five similar seven-car trains operated between Toronto and Montreal by Canadian National Rys. CN's Turbos made the 335-mi. trip in four hours, averaging 84 mph when all went well—but they ran as much as three hours late on almost half the runs since the service started in mid-December. Problems in electrical systems impaired lighting and heating (fresh-water pipes froze and burst). But CN says it has had very little trouble with the turbine power units and trains will be back in service soon, perhaps in February.

Overseas. The 320-mi. Tokaido line between Tokyo and Osaka has been a popular and financial success since it was opened by the Japanese National Rys. in 1964. In the year ended last Mar. 31, the line carried more than 55-million passengers, up 26% from the year before. The Soviet Union is working on a 125-mph train, scheduled for 1970, for the Moscow-Leningrad corridor. And both Italy and Germany have plans for high-speed "superexpresses."

A glimpse of tomorrow

The first American superexpress, the Metroliner, is designed to present an image of a new era in passenger railroading, at least as it is practiced in most parts of the U. S. Coach seats, for example, are high, wide, and spacious, resembling seats in the first-class section of an airliner. Floors are carpeted. Each seat has adjustable lighting. The air-conditioning not only avoids alternately roasting and freezing passengers, but makes it possible for a smoker to puff away at any seat without offending a nonsmoker next to him.

And a mobile telephone system

permits direct distance dialing, whether the train is moving or standing still. The phones will also receive calls.

Thanks to long strings of welded rail replacing bolted rail over most of the route, even the old clickety-clack is largely gone. Another innovation: Passengers are no longer asked to "please refrain from flushing toilets while the train is in the station." The Metroliner toilets have airline-type disposal units.

Some bugs. With all the improvements, though, the Metroliners have a closer resemblance to conventional trains than to the futuristic high-speed ground vehicles that may someday replace them. A muted rumble of steel wheels on steel rail is audible over the soft background music. It is still necessary occasionally to grab a seat back for support if you are on your feet as the train leans into a curve. Coffee at the snack bar still sloshes to the rim of the cup. And some debugging remains to be done before the demonstration project can begin.

Inauguration of the service on the present limited basis came less than a week before Boyd, a mover and shaker for the project, bowed out of office. Still unsettled is the starting date for the official demonstration project. Boyd and Penn Central Chairman Stuart T. Saunders have said that it would not begin "until at least 28 cars—20 coaches and 8 snack-bar coaches—are available." The Transportation Dept. says that only 13 snack-bar coaches and seven parlor cars have been accepted.

Argument. The 20 coaches without snack bars, none of which have yet been accepted, have been the cause of argument, confusion, heartbreak, and threatened litigation between Budd Co., their builder, and Westinghouse Electric Corp., which supplies the electronic control and power equipment for these coaches.

The extent of the problem has never been divulged, but one source suggests that Budd, Westinghouse, and the railroad are negotiating some changes in specifications involving speed and braking limits. The six-car train with which service was begun is powered by General Electric Co. gear.

Robert A. Nelson, director of the Transportation Dept.'s Office of High-Speed Ground Transportation, says the 20 Westinghouse-equipped coaches are "essential" for the federal demonstration program.

Defense. The Transportation Dept. is pleased that Penn Central chose to start service without waiting for delivery of all 50 cars, Nelson says. He admits that the 75-mph average speed of the new service is "not high-speed transportation. It's a demonstration of improved rail service." However, he doesn't think that the delays have wiped out public interest. And he argues with critics who complain that the full demonstration will be too small to be meaningful.

"If we had taken a more ambitious approach," he says, "there might not have been service for some time to come." Penn Central is adding $43-million of its own money to $12-million of federal funds to get the project started, he notes, and "we don't have sufficient knowledge at this time to make a judgment to expend additional large sums of public money that would be needed."

Ticket to the future

The merit of the demonstration project, when it finally gets under way, says Nelson, will be that "it should end speculation about the future of rail passenger service. If the demonstration is a resounding failure, for example, this should end all the talk that the railroads could provide their own salvation."

Although he expects "incremental improvements" in technology to emerge from the demonstration, he thinks real breakthroughs in ground transportation are more likely in such developments as the air-cushion vehicle. Currently, a research vehicle is under construction to test a 2,500-hp linear electric motor this spring. The next step will be to test the motor in a tracked air-cushion vehicle on which both Grumman Aircraft Engineering Corp. and GE are working.

Next generation. With possible speeds of 250-300 mph, "this is the next generation in the development of high-speed ground transportation," says Nelson. "If we could move on this project, we could have a system operating in four or five years." Another project he mentions is the tube transit system being studied at Rensselaer Polytechnic Institute in Troy, N. Y. "We're learning a great deal from these studies," Nelson says, "but it wouldn't be fair to say we've achieved any breakthroughs."

So for the present, there's the Metroliner. Says Senator Clairborne Pell (D-R. I.), who took the leadership in stimulating Congressional interest in Northeast Corridor transportation. "For more than eight years, I've had a dream of decent, clean, prompt, polite service for people up and down the Eastern Seaboard. I'm glad this day is here."

1968

The Public Facilities Gap

The growth of public facilities and public services in America has not measured up to the needs of a steadily growing, increasingly urban population. Despite a stepped-up effort in recent years, there is still a sizable backlog of unmet needs.

With the population continuing to grow—and with more and more people crowding into urbanized areas—these needs also will continue to grow. The nation will require still more in the way of public facilities and public services. And the only way these needs can be met is by substantially increased outlays for these purposes by government—federal, state and local.

In a very real sense, the pressure for expanded public facilities and public services stems from technological progress. This is no longer a nation of farmers as it was at the turn of the century, when approximately 40 percent of the employed manpower was engaged in agriculture. Today, because of improved technology, it takes only about 5 percent of the workforce to produce enough food for the population—and a considerably larger population at that. In 1900, this was a nation of 75 million; now there are nearly 200 million people in the United States.

There has been a steady movement of people off the farms and into the growing industrial and commercial areas. The growing numbers that first crowded into the cities has overflowed into the suburbs—into one suburb after another, stretching the urban area far beyond the boundaries of the central city and leading to the suburban sprawl.

At the turn of the century, less than one-half of the nation's population lived in such urbanized areas. Now the figure is around 70 percent and still climbing. By 1980, it will be close to 80 percent, but of a much larger population—250 million. And, by the year 2000—when the population is expected to reach 350 million—one estimate places the urbanized portion at 95 percent.

The growth of urban areas—together with the greater aspirations—has led to a growing demand for public facilities and public services: paved streets and highways; bridges and tunnels; storm sewers and sanitary sewers; schools, colleges and libraries; hospitals and clinics; police and fire protection; public utilities; parks, playgrounds and recreation centers; airports; museums and theaters; clean air and clean water; public transportation.

Some of these public services are provided mainly by private businesses for a profit. This is true, for example, in the case of gas and electric utilities. These are usually, but not always, privately-owned operations.

And some are provided by so-called private, nonprofit organizations. Many hospitals fall into this category.

But for most of these services, and for the facilities they require, people depend upon government—mainly state and local government, with a helping hand from the federal government.

A Ten-Year Program

For many years, when the Depression and World War II caused shortages of money, manpower or materials, these public needs went neglected. And programs initiated since the end of the war have hardly reduced the backlog. Of the nation's public schools, for example, 14 percent were built before 1920, while

Prepared by Department of Research
Reprinted from March 1967
AFL-CIO AMERICAN FEDERATIONIST

15 percent of the libraries date from before the turn of the century.

Meanwhile, the needs have continued to grow and they will keep on growing. A reluctance to spend enough money to meet these needs has been the basic problem. But it has not been the only one.

There also has been a lack of information. That is to say, detailed estimates of the full range of needs have been non-existent, especially as regards estimates of future needs. And without such data, long-range planning—the only effective way to meet these needs —is next to impossible.

A major step in closing this gap has recently been taken. Thanks to the efforts of the Joint Economic Committee of Congress, there exists now a pretty solid blueprint—projected to 1975—of state and local public facility needs. It provides the basis upon which to embark on a long-range, planned program to meet those needs—to catch up with the present backlog and meet the future needs as the population grows.

The information contained in the Committee's study, which is titled "State and Local Public Facility Needs and Financing," represents the findings of experts in their respective fields.

And it is comprehensive, covering needs in about 40 different kinds of public facilities: basic community facilities, such as water supply, sewers and waste treatment; transportation facilities, such as roads, turnpikes, tunnels and airports; educational facilities, including all levels of schools as well as college housing; health facilities, such as medical schools, hospitals and clinics; recreation and cultural facilities, including neighborhood centers, arenas and auditoriums; and public buildings, such as jails, fire stations, armories and courthouses.

The study does not deal with housing and urban renewal, important though these items may be. They were regarded as outside the scope of the definition of public facilities. Moreover, the projected cost estimates contained in the study cover only the capital outlays for the facilities—the costs of construction and equipment. They do not include the cost of providing the services—the additional teachers, doctors, policemen and numerous other personnel—after the facilities are built.

Nor is it beyond the realm of possibility that the experts have underestimated state and local public facility needs. "It is conceivable," the introduction to the study says, "that many of the chapter authors preferred to employ conservative judgments . . ."

Even at that, the experts believe that state and local governments will have to step up their public facility capital outlays considerably if they are to meet these needs. In 1965, these expenditures came to $20 billion. By 1975, they will have to total more than $40 billion. And, over the entire 10 years, the experts estimate that state and local governments will be required to spend a grand total of $328 billion to finance public facility needs.

Viewed against a backdrop of needs and capabilities, these projected figures are not as large as they initially appear.

In the first place, there exists a substantial backlog of sorely-needed facilities.

Second, the population, which totalled under 195 million in 1965, is expected to reach 230 million by 1975 and the proportion of the population crowding into urbanized areas will continue to increase. And, finally, by 1975 the total output of the nation's economy, assuming continued high levels of employment, will be in the vicinity of $1,250 billion per year—as against $680 billion in 1965.

Thus state and local expenditures of $40 billion per year for public facilities would not represent a significantly greater rate of spending—in terms of the nation's output—than did the $20 billion in 1965.

Funds for these outlays come essentially from three sources—borrowing, taxes and other current revenues such as user charges, and federal grants-in-aid.

In the recent past, borrowed money has provided about 50 percent of the needed funds. Taxes and other current revenues have accounted for 30 percent and federal grants produced the remaining 20 percent.

On the assumption that high levels of economic activity are maintained, the report of the Committee anticipates that these sources will be adequate to finance the needed increase in outlays. That is to say, with adequate economic growth these outlays can be met in the future in much the same way that they have been in the past and without any greater strain.

In other words, the nation is fully capable of meeting its rapidly-growing needs for additional public facilities.

The Employment Impact

As a matter of fact, a stepped-up, planned program to meet the needs in public facilities—not only state and local, but also federal—will be required in the

years ahead to provide jobs for a rapidly-growing workforce. Over the next decade, the labor force will increase by about 1.5 million workers per year and, unless the number of job opportunities keeps pace, unemployment will rise. A logical policy would be to see to it that these two needs—the growing need for jobs and the pressing need for public facilities—are brought together in a planned program.

The employment impact of these construction activities is substantial. The U.S. Bureau of Labor Statistics has estimated that each million dollars spent in this way creates approximately 100 jobs for the year—about 40 jobs at the construction site and about 60 jobs in industries supplying building materials, equipment and services, including unskilled and semi-skilled jobs badly needed in an automated economy.

Moreover, to this must be added the indirect impact—that is, the impact felt as a result of the wages and salaries paid to these workers. As these wages and salaries are spent, retail sales are increased and still more jobs are created—in stores and warehouses and in companies producing consumer goods. This adds another 50 to 100 full-time jobs.

This would mean that $1 billion spent on public facility construction is worth 100,000 jobs directly created on the construction site and in the production and distribution of equipment and materials, plus somewhere between 50,000 to 100,000 more jobs as a result of the increased sales to consumers.

It is obvious from these figures that outlays for these public facilities have a significant employment impact. But the basic reason for these outlays is to provide much-needed public services. And with the growth of the nation and its urban areas, these needs will grow.

It might be well to take a look at a few types of state and local public facilities—and at how much capital outlays will have to be increased, according to the estimates of the Joint Economic Committee's experts, if the needs of the people are to be met.

Public Water Supply

Not too many years ago, most Americans took their water from wells or springs. As a matter of fact, not much before the turn of the century, the public water supply system served only about one-third of the population. Today, it serves about 80 percent and it will grow. Increasingly, Americans are getting their water supply by turning on a faucet.

But it costs money to put that water, literally, at the consumer's fingertips.

It first has to be taken from its source and this may necessitate the construction of dams or the creation of reservoirs. Then it must be transported and this means pumping stations and pipelines. And it is usually transported first to treatment plants—another expense—because even water of excellent quality very likely needs a disinfectant as a safeguard. And, if it is not of excellent quality, it requires much more extensive treatment to make it safe and palatable.

When the water is ready for consumption, it goes through the distribution system and that system requires pumping and storage facilities and water mains.

In 1965, state and local governments spent just over $1 billion in capital outlays on such public water supply systems. The needs estimated for 1975 will require $2.25 billion. And, from 1966 to 1975, the total amount that will have to be spent by state and local governments for these capital outlays will be roughly $19.5 billion.

Storm Sewers

If getting water to the urbanized population represents a problem and an expense, so does getting rid of an excess amount. It is estimated that the failure to provide adequately for the runoff—that is, to provide enough storm sewers—costs the nation about $1 billion per year in property loss. The Joint Economic Committee described the problem this way:

"Inadequate disposal of runoff often results in widespread loss of valuable time and frequently causes great inconvenience to urban populations. This is characterized by persons arriving late to places of employment, or perhaps not reporting at all, because of delays in transportation caused by street flooding, or resulting from the need to care for property being endangered by flooding.

"Flooding of basements can result from unsatisfactory or nonexistent storm sewer systems. The results may vary, from mere inconvenience and loss of use of basement facilities, upward to very serious threats to health and safety. The extensive use of combined sewers presents a threat of disease to the helpless public in such areas.

"In commercial areas, where food may be served in basement cafeterias and restaurants, such basement flooding admits sewage which could cause disease to spread rapidly to many persons and, if communicable, thence to others over wide geographic areas.

"In industrial and commercial areas, basement flooding from combined sewers frequently causes serious damage to mechanical, electrical and processing equipment, such as power generating equipment, heating and cooling equipment, transformers, mechanical shop equipment and stored equipment, goods and supplies."

And, the report points out, "the present rate of industrial expansion and population growth in urban areas [will very likely mean] an increase in losses due to such property damage."

The cost to state and local governments to meet the nation's needs in storm sewers, in order to cope with the runoff problem, will grow substantially. The needed capital outlays estimated for 1975 will be about $1.8 billion—in contrast to 1965 outlays of approximately $400 million. The total amount required for the 10 years between 1966 and 1975 is estimated at $16 billion.

Waste Disposal

Inadequate facilities for the disposal of waste are a danger to health and safety. And with the continued growth of the population in urban areas, and with

increased industrialization, the need for expanded and improved facilities also grows.

Facilities to dispose of this human and industrial waste include sanitary sewer collection systems as well as waste treatment plants. The waste must be subjected to extensive treatment so its subsequent discharge will not be a health hazard.

According to the report of the Joint Economic Committee, existing combined sewer systems—that is, systems used both for water runoff and for waste—constitute "the single largest problem involving adequate sewage collection facilities which must be resolved. . . ."

In 1965, state and local government capital outlays for sanitary sewers amounted to $385 million and outlays for waste treatment plants amounted to $625 million. To meet the projected needs, these figures will have to rise, respectively, to $1.1 billion and $1.2 billion in 1975. Over the 10-year period, the total outlays required for these two types of facilities are estimated at more than $17.5 billion.

Public Elementary and Secondary Schools

In the postwar period, there has been a tremendous upsurge in enrollments in public elementary and secondary schools. In contrast to the 25 million pupils who attended public schools in 1947, enrollments in 1965 reached 42 million. The estimate for 1975 is 48 million.

Despite the increase in state and local outlays for additional public elementary and secondary school facilities in recent years—the amounts rose from $111 million in 1946 to about $3.7 billion in 1965— not enough has been spent. Millions of children and youths are still being shortchanged on their education because inadequate and overcrowded classrooms lead inevitably to inferior education. And these are the conditions that presently prevail.

The estimate of the number of classrooms needed depends upon the standards used concerning the number of pupils per room. The U.S. Office of Education, in a chapter written for the Joint Economic Committee study, applied as a standard the present national average of 27 pupils per room. As a result, it estimates that 107,000 classrooms are needed now to handle overcrowding.

This is a highly conservative estimate. Many education experts, including those in the AFL-CIO, believe the present national average itself represents general overcrowding. The AFL-CIO estimate of needs to deal with overcrowded rooms—based on 25 elementary school pupils per room and 20 high school pupils per room—is 286,000 classrooms, considerably in excess of the 107,000 rooms suggested by the Office of Education.

Regardless, however, of which estimate one accepts, it is obvious there is at this time a substantial backlog of classrooms needed simply to deal wtih overcrowding.

But this is only a small part of the total backlog. According to the Office of Education, there is, in addition, a need for nearly 200,000 classrooms to replace existing facilities that ought to be abandoned because they are unfit. While the exact number of youngsters subjected to schooling under these conditions cannot be determined, it runs in the millions.

All told, the Office of Education places the nation's need for new public elementary and secondary school classrooms at 750,000 over the next 10 years. Of this number, 300,000 would be required to cope with the present backlog and 350,000 to take care of increased enrollment. The remaining 100,000 will be needed to replace facilities which will become outmoded.

In order to meet these needs, state and local outlays for public elementary and secondary classroom construction will have to rise to $5.3 billion by 1975. In 1965, the outlays came to $3.7 billion. Over the entire 10-year period, the amount which will be required totals $42 billion.

Included in these figures are outlays for area vocational schools. Over the 10 years between 1965 and 1975, capital expenditures for these facilities will absorb over $6 billion of the $42 billion total.

In recent years, there has been a growing recognition of the need to modernize vocational education. The quality of the training has left much to be desired and, as a consequence, too many youngsters have been turned out inadequately prepared for the modern job market.

Area schools are essential to this effort to improve vocational training because, for many occupations, facilities for small numbers of students cannot be economically provided. The cost involved for adequately-equipped shops and laboratories—if students are to

The Backlog in Classrooms

* The number of pupils cannot be added together since there is duplication. That is, some of the pupils are in classrooms which suffer from more than one of the problems listed. In other problem areas, 185,000 pupils are in schools without running water and 64,000 are in schools lacking electricity.

Source: "State and Local Public Facility Needs and Financing;" Joint Economic Committee of the Congress, December 1966, Pg. 347.

be trained for some of the better jobs in a highly-automated economy—makes it necessary to develop more of such facilities on an area basis.

Higher Education

In part reflecting greater aspirations as a people, an ever-growing number of young people are attending college. And, while a substantial number seek their higher education in private schools, the large majority depend upon publicly-supported institutions.

In 1955, publicly-supported institutions of higher education—four-year colleges and junior colleges—had approximately 1.5 million students enrolled. By 1965, this figure had risen to more than 3.5 million. And in the years ahead it is expected to increase still further, by about 5 percent per year.

If this growing demand for higher education opportunities is to be met, state and local governments will have to spend $13.9 billion for academic facilities during the 1966-75 decade. And, in addition, another $6.1 billion will be required in order to provide housing and related facilities for the students. As a result, outlays for academic and housing facilities will have to climb from approximately $1.2 billion in 1965 to nearly $2.5 billion in 1975.

Health Facilities

According to the projected needs, state and local capital outlays for health facilities will have to reach $1.7 billion in 1975. In 1965, these outlays amounted to $500 million.

The growing needs in this field reflect both the growth of the population and the growth of aspirations. An ever-growing number of people are intent upon receiving the best possible health care and existing facilities in many instances are either inadequate or overburdened.

Although most of the hospitals in the country are not governmentally operated, a substantial number—approximately 25 percent of the total—are operated by state and local governments. Over the decade of 1966-75, total capital outlays by states and localities to provide the additional facilities that will be required will come to nearly $4 billion.

The health needs of the people also will compel state and local governments to step up outlays for many other health-related facilities, such as clinics, mental health centers, medical research facilities and medical schools.

The total capital outlays by state and local governments for all types of health facilities in order to meet the growing needs of the people will have to reach over $13 billion during 1966-75.

Transportation

As a people on wheels, Americans depend heavily on highways, roads and streets—to move commerce, to get to work, to take care of chores and to enjoy leisure hours. And since people are so dependent on a big and growing network of highways and streets, it is not at all surprising that these types of facility should represent a fairly substantial expenditure by state and local governments.

In 1965, $7.9 billion was spent by state and local governments for road construction. In order to meet estimated needs for 1975, the annual expenditure should be over $15 billion, or not quite double the rate of spending in 1965. And over the 10-year period of 1966 to 1975, the total outlays—if expected needs are to be met—will have to be more than $121 billion.

The nation's transportation needs, however, do not end with highways, roads and streets. They include bridges and tunnels and parking facilities, as well as airports and marine port facilities. During the 10 years of 1966-75, state and local capital outlays to meet these needs are estimated to total nearly $12 billion.

Moreover, several million Americans, especially those living in the urbanized areas, depend daily on mass transit facilities. The fact that a declining number of people rely on such public service—while a growing number have turned to the automobile—does not mean that mass transit is any less of a problem. Service is generally inadequate and fares constantly rise and, as a result, more and more people turn to the automobile. As the number of riders shrink, the fares go up again, and service may be reduced. This forces still more commuters to turn to the automobile.

One end result of all this is substantially increased automobile traffic and frequent traffic jams—and the demand for still more roads and highways which, of course, means more spending.

Congress finally recognized the transportation plight of the urban-area dweller in adopting the 1964 Urban Mass Transportation Act. As a result, federal grants are now available to aid state and local governments in connection with capital outlays for mass transit facilities.

In 1965, state and local governments spent $242 million in capital expenditures for urban mass transit facilities. In order to meet the needs estimated for 1975, spending for these purposes will have to climb to nearly $1 billion in that year. The total cost projected for the entire 10-year period is about $5 billion.

The Need for Long-Range Planning

These are but a few examples of growing public facility needs and the estimates of experts as to how much they will cost. And, as the urbanization process continues and as the population grows, these needs also will continue to grow. And they will grow also because man's aspirations—spurred on by scientific and technological advances—will continue to rise.

President Johnson in 1965 called the city and its suburbs "a community for the enrichment of the life of man." But it can be this only if it serves his wants —only if it helps to make his life more pleasant. And, in the crowded, urbanized areas—indeed, also in the less crowded areas—this cannot be done without adequate attention to needed public services. And these require public facilities.

The fact that the nation has the capability—the money, manpower and materials—in no way guaran-

tees that these needs will be met. There is still the problem of commitment and planning. That is, government at all levels still must make the decision to meet the needs and this can be done effectively only if there is adequate long-range planning.

The study of the Joint Economic Committee has provided numbers in the aggregate. What is sorely needed at this point are the details—state by state, community by community. The federal government should lose no time in urging these other governmental units to come up with the specific projects, based on their anticipated needs over the next decade.

The federal government can then plan ahead in terms of its grant-in-aid programs. During the current year, federal grants to help state and local governments with capital outlays for public facilities approximate $4.9 billion. In the years ahead, this figure will obviously have to increase considerably in view of the expected growth in public facility needs.

The development of such an inventory and a long-range planned program has been long advocated by the AFL-CIO. In its policy resolution on "Public Investment to Meet America's Needs," the 1965 AFL-CIO convention declared:

"A vast and planned national effort, under federal leadership, is needed to apply as much of our resources as possible to meet these [public] needs within a reasonable period of years. Such effort should be based on a national inventory of needs in the various categories. . . .

"The AFL-CIO urges the federal government to develop, coordinate and maintain a national inventory of needs . . . based on present backlogs and future population growth. Each state and metropolitan area should be encouraged to develop an inventory of needs within its geographical jurisdiction, in addition to the development of a coordinated national inventory, prepared by the federal government.

"Such comprehensive inventory of needs should provide the foundation for nationwide programs in each category—based on federal financial and technical assistance to the state and local governments, including federal grants-in-aid and guaranteed loans, as well as direct federal efforts. Target dates should be established for achieving specified objectives and the pace should be speeded up or slowed down, depending upon changes in defense requirements and the availability of manpower and productive capacity.

"We urge the federal government, the states and metropolitan government authorities to develop such inventories of needs in housing, community facilities and public services as soon as possible and to move ahead rapidly, with sufficient funds and resources, to meet the requirements of a rapidly growing, urban population."

Each year the needs increase. There is more and more pressure for additional facilities to catch up with the backlog and to provide for growth. These needs can be met effectively only by a planned national effort, with vigorous federal leadership and financial aid.

Atlanta, Georgia 30303

Dear Mr. Via,

This letter is to confirm our telephone conversation regarding the Wednesday, March 12 advisory panel to the Urban Mass Transportation Administration of visiting expert professionals. The purpose of our meeting will be to discuss Potential Impacts of Providing Demonstration Grants to Non-Conventional Carriers, and to provide guidance to the federal government on relevant matters concerning the best interests of the nation.

Members of the panel will meet at noon in Mr. Thomas Floyd's office, room 704, U.S. Department of Transportation, 800 Independence Avenue, before proceeding to the department's executive dining room for lunch.

The closed meeting will begin after lunch and will be considered informal, and off the record. Enclosed is the agenda of the meeting in addition to an outline of relevant topics to be discussed.

Any direct costs incurred by you will be reimbursed. I look forward to our meeting.

Sincerely,

John L. Crain

Mr. John L. Crain
Consultant to U.M.T.A.
Stanford Research Institute
Menlo Park, California 94025

Dear Mr. Crain:

I was embarrassed after having agreed to set aside the afternoon for the panel discussion on the impacts of non-conventional carriers to have to leave early; my other meeting concerned a matter on which I had been working for two years and was in the nature of an emergency. I trust the remainder of the meeting went well and I would like to receive any informal report of the results.

Attached are summary, non-technical, reflections of my views as of the time I left the meeting.

Thanks for your invitation to join the group. If there were to be another discussion we now would be in better shape to suggest participants for your consideration.

Sincerely,

Emory F. Via, Director
Labor Program

EFV/km

Enclosure

Hardcore unemployed transportation problems are serious. They require immediate attention. Constructive Federal policies could prod local communities and transit systems to undertake efforts aimed at providing transportation which is realistic from the view of the hardcore worker. Where the offer of a first refusal results in no action, Federal policy should be such as to encourage other groups to provide service.

Although sympathetic to the problems of dislocation of existing services through "competition," I feel that this is a risk worth taking. Some non-conventional approaches will not disturb existing services. Some will be temporary. A system of adjustments, payments if need be, to traditional carriers for demonstrated loss, would be better than simply saying that unknowns are too great or institutional barriers too high. In this regard would it not be possible to make sufficiently educated estimates of possible impact on traditional carriers, by-pass delaying studies, and begin to meet the immediate social needs?

I would think that flexible approaches tailored to the character of city and transit system would be possible. Perhaps all non-conventional schemes, except where city and transit system are willing and competent partners, should be established for limited time periods, subject to review and revision if negative impacts can be shown.

I would have been interested, as a non-specialist, in more discussion of non-conventional services that might be offered by existing carriers. For instance, what are the problems of using smaller vehicles either as feeder or direct transportation where demand is low, streets won't take heavy vehicles, etc.

I bow to the experts on the panel in their observations

about regulatory agencies. If the agencies are as unresponsive and resistant as pictured, then it seems to me public policies must be obtained which reconstitute them, by-pass them, or abolish them.

Dear Mr. Via:

Enclosed is a copy of the Manpower Development Corporation's study of Transportation Concepts for Unemployed and Under-employed Persons in North Carolina and a proposal drafted pursuant to that study. George Esser suggested that these copies be made available to you.

We would greatly appreciate any comments you might have.

Sincerely,

George B. Autry
Executive Director

M - Transportation

TRANSPORTATION

A tough professor climbs aboard

Paul Cherington, Transportation Dept.'s policy developer had a reputation for toughness at Harvard. This trait and his cool practicality are expected to get the agency off 'dead center'

"After 18 years in the academic quiet, I decided it was time to get back to real life and see if the things I've been talking about will work."

That's why Paul Cherington early this year gave up his chair as James J. Hill Professor of Transportation at the Harvard Business School to move into one of the hottest seats in Washington as top policy developer for the Transportation Dept.

If anything can get transportation policy off its position of "dead center" in this Administration it will probably be the thinking of the 50-year-old Cherington. To a unique degree he combines the detachment of a college professor with a vast knowledge of transportation problems. He also has a cold, practical, emotionless approach to what can and cannot be done.

Cherington accepted his new job as Transportation's Assistant Secretary for Policy & International Affairs because it involves "a hell of an interesting batch of problems which I know something about, and which I believe I can do something about," he says.

As a key adviser to Transportation Secretary John A. Volpe, Cherington is quickly getting an opportunity to test his ideas. Volpe swore him in only a month ago. Already he has contributed to an Administration decision on the fate of the supersonic transport plane due to be announced shortly and has evolved a plan to expand the country's airport and airways network. He was also a key figure in the revised transpacific airline route decision (box), updating economic data and relating their impact to the foreign policy aspects of the case. And all this is only a beginning.

Faster tempo. "Real life" for the former Harvard professor in the early days of the Nixon Administration is a rush act. Lighting a cigarette as he settled behind his desk early one morning last week, Cherington commented: "I usually smoke a pipe, but I find it hard to keep it going around here."

The relative calm of classes and seminars at Cambridge has given way to a hectic work schedule that runs from eight to eight and includes weekends. Typically, a recent day opened with a job seeker's interview, included a meeting with Air Transport Assn. officials, a briefing on Great Lakes pilot problems, lunch with "a theoretical job seeker," discussions with McDonnell Douglas Corp. executives on the company's aerospace industry projections, a session at the Budget Bureau, and a high-speed ground transportation review.

Well prepared. Cherington isn't unprepared for this onslaught. He knows the pitfalls of Washington bureaucracy from his staff experience at the Civil Aeronautics Board in the late 1940s. While at Harvard he collected extensive transportation industry background through a string of consulting assignments for many railroads and maritime companies and for nearly every major U. S. airline.

"For every hour he spent at the Business School he spent three on the outside working for clients," says a longtime friend. Cherington was for several years president of United Research, Inc., a Boston company specializing in transportation consulting. More recently he was associated with the Boston-based management consultants, Harbridge House, Inc.

Provocative cynic. Transportation's new Assistant Secretary for Policy isn't easily overwhelmed. A genial man with an easy grin, Cherington is remarkably open and frank for a Washington newcomer. "I want to operate this office on an open-door basis," he says. "I'm willing to talk to anyone as long as I can fit them in. The only limitation is the length of the queue."

This doesn't mean he can be easily buffaloed. "His sense of humor serves him well," says a staff aide. "It has a nice cutting edge that he uses effectively to reduce the overinflated."

He was known at Harvard for being rough on his classes, even to the point of cynicism. "He gave the impression he thought most of his students were a lazy lot and not particularly bright," says a friend. Cherington used the case method of teaching, standard at the Harvard B School, in which there is generally no one "right" answer to a problem. He was often brutal with a student who couldn't adequately support whatever answer he chose. And yet, Cherington was also considered by the students to be one of the most provocative and rewarding teachers at the school.

His cynicism stands him in good stead in his government post. He knows all the pleas and pitches from the transportation industry's never-ending parade of special interest groups. He has a way of shutting his mind to all their emotional and tired cliches. Without saying anything, he can let a visitor to his office know it's time to leave once everything new and important has been covered.

Cherington's announced willingness to talk to anyone is not exactly accurate. When word got around that he was reviewing the Pacific route case, at least one airline president deeply involved in the case suggested a lunch meeting. Cherington turned the invitation down flat.

Stingy with words. Transportation staffers working for Cherington express approval of their new boss. Says one: "He's very New Englander like—a very quiet individual. He's pithy, even stingy with words—spoken or on paper. He listens closely and soaks up what's important. To sum up his approach: absorption, then decision."

Secretary Volpe has great respect for Cherington's judgment, department officials report, seeking his opinion constantly through private memos and calls.

"Of course, the secretary doesn't buy everything he's offered," one official observes. "He's a very independent operator, too."

Programs coming up. The primary offering so far from Cherington's office is a new federal airport and airways program, now undergoing scrutiny within the Administration. Says Cherington: "We haven't discovered any new magic formula. We've simply reformulated past approaches."

The package is expected to include a plan for a practical user charge formula and increased participation by Washington in development programs through outlays from a new airport and airway trust fund, similar to the existing highway trust fund. The bigger federal role in Cherington's proposal would go further to meet industry desires than the plan proposed last year.

Cherington's testimony last month before the House Commerce Committee studying new legislation on acquisition of airlines reflects his characteristically pragmatic approach. He avoided enunciation of broad prin-

Pacific air-route expansion deflated

New economic data developed by Assistant Transportation Secretary Paul Cherington laid the foundation for a sharply revised final verdict from the White House last week on the long-disputed transpacific airlines route case.

President Nixon reduced the scope of the Civil Aeronautics Board's plans—essentially approved by the Johnson Administration—for heightening competition in the Pacific. Heeding Cherington's advice, Nixon turned down some recommended new authority for Pan American World Airways and Northwest Airlines, and cancelled key international awards to Continental Air Lines and Braniff Airways. But Trans World Airlines does get to close the gap between Hong Kong and Los Angeles in its otherwise global routes, and Flying Tiger Line keeps new international awards approved last year. Pan Am and Northwest remain the only U. S. passenger carriers to Japan.

Braniff loses a crack at Hawaii via Mexico. Continental is shut out as competitor to Pan Am on the promising South Pacific run to Australia and New Zealand. The White House objected to Continental's plans to fly from West Coast terminals. It asked CAB recommendation of a new carrier to serve from Eastern and Midwestern terminals. A CAB examiner earlier in the case proposed such service, for Eastern Air Lines.

Fear of retaliation. Cherington recommended slimmer pickings for U. S. airlines after finding that CAB forecasts for Pacific traffic were excessive by as much as one-third. A White House official said the Johnson Administration's version would have resulted in "inflated route awards lacking in economic viability." Nixon feared this might lead to tough retaliatory measures abroad, particularly from Japan.

Loser Continental this week brought suit in the U. S. Court of Appeals in Washington, charging that President Nixon intervened illegally in overruling the CAB decision approved by President Johnson. If Continental follows this with a request for a stay of board action, first flights under the new authority might be further delayed.

Cherington (right) is key aide to Secretary John Volpe (seated).

ciples about the right or wrong of the conglomerate takeover trend in transportation.

Instead, he suggested that a holding of 10% by one interest would more realistically represent control of an airline, rather than the 5% defined in the bills. He asked for a clearer delineation of any new authority granted to CAB over conglomerate plans to acquire airlines, to insure that the legislation doesn't provide an umbrella that will shield such transactions from antitrust laws.

Policy review. High on Cherington's list of things to do is a review of U. S. maritime policy. There have been legislative proposals calling for a reloca-

Cherington, in his new job, is wary about overdependence on studies.

tion of the Maritime Administration, now under the Commerce Dept. A new attempt will be made in Congress this year to give the agency independent status. There is also some feeling within Transportation, expressed strongly by former Secretary Alan S. Boyd, that it should be moved to that department.

Comments Cherington: "If you don't have much more of a maritime program than we do now, it doesn't make a damned bit of difference where the Maritime Administration is located. If Commerce wants the scrawny old thing, I'd be disposed to let them have it." What's needed is a whole new policy, he says, which his office will help develop.

Wary about studies. A surprising element in Cherington's approach, at least to several Transportation staffers, is his wariness about studies as a policymaking tool. "He isn't partial to so-

DETROIT EDISON REPORTS

Detroit Edison Serves the Heart of the Great Lakes Megalopolis

Detroit Edison is in the final phase of a five-year study to assist in the orderly development of the Urban Detroit Area and the emerging Great Lakes Megalopolis. Findings show evidence that by the year 2000 the Great Lakes Megalopolis may overtake the Eastern Megalopolis in population. The Great Lakes area has a great potential and Detroit is at the center.

The study was undertaken in cooperation with Wayne State University and Doxiadis Associates of Athens, Greece. The purpose is to provide Detroit Edison and others with a timely understanding of the forces that are at work and the trends in urbanization and land commitment that must be encouraged. Another demonstration of how Detroit Edison plans ahead in the interest of the people it serves.

lutions by way of lengthy, expensive studies," observes one. "In fact, he can be quite cynical about this; he'd prefer to make a beginning than wait for one more study result."

But if Assistant Secretary Cherington is bored with reading expensive studies, Professor Cherington was not backward in producing them. He has had a hand in dozens of them.

Cherington observes that "your ideas change when you move from the banks of the Charles to the banks of the Potomac." Used to approaching transportation problems with his students along the puristic avenue of systems analysis, Cherington says: "You don't give much attention to the real constraints of politics. You might come up with the right program, but it would have no chance of acceptance."

He adds: "Now you have people talking back to you; you have to sell at the fare box."

Piecemeal approach. Knowing how to get things done in Washington is a valuable asset in the two-year-old Transportation Dept. Since its inception, Transportation has been plagued by the jumble of different regulations, restrictions, and administrative agencies that control the different forms of transportation.

Late last year, Cherington's predecessor at the department, M. Cecil Mackey, bluntly characterized the situation as "a mess," and urged that one of the first orders of business in the new Administration should be to reevaluate the entire system of transportation regulation.

Cherington agrees that all is not perfect when it comes to operation and coordination of such independent agencies as the Interstate Commerce Commission, the Civil Aeronautics Board, and the Federal Maritime Commission. He does not, however, feel that revolutionary changes are in order.

"Rather than go in with a meat ax," says Cherington, "and take the agencies over or merge them into one, I'd approach the problem piecemeal in particular areas, and try to work out what relations should be between agencies and with Transportation. I'd take it very slowly and work out solutions one by one rather than have some great and glorious coup in which you abolish these people or take them over."

Long-range goal. For the long haul, according to Cherington, the goal of the department should be to "establish an integrated transportation system that works pretty efficiently in terms of the economics of moving people and goods around. And this, he adds, "will involve more integration and coordination between types of transportation than in the past." **End**

WELFARE SHOWS SLOWER GROWTH

But Ginsberg Says Medicaid Cut Could End Decline

By DAVID BIRD

Mitchel I. Ginsberg, the city's Human Resources Administrator, said yesterday that the latest figures indicated a "dramatic and drastic decline" in the rate of increase on the city's welfare rolls.

But he said the state's cutback in Medicaid—a move he described as "utter insanity"—could reverse the decline by forcing "at least 50,000 or more persons" on to welfare.

Mr. Ginsberg said that in the first quarter of this fiscal year, which began last July 1, there was a net increase of 21,500 in the welfare rolls. This dropped to an increase of 14,200 in the next three months and to an increase of 9,200 in Jan. 1. The latest figures, for April and May, show the increase is only "averaging about 7,000," he said.

The total number on welfare now, Mr. Ginsberg said, is 1,012,000.

Mr. Ginsberg emphasized that this was only a slowdown in the increase and not a decrease, and that the number on welfare —currently 1,012,000 is continuing to rise.

Mr. Ginsberg said it was difficult to cite a specific reason for the decline in the rate of increase, but he said the factors included a better economic situation generally, a slowing migration to the city and programs to help welfare recipients to become employed.

200,000 Cut From Medicaid

In an economy move to help balance the state budget, this year 200,000 people just above the welfare level were dropped from the Medicaid program, which had paid for their medical bills.

Appearing on the WCBS TV program "Newsmakers," Mr. Ginsberg said that "there's simply no justification" for the cutback in Medicaid.

He said that, "humanitarian concerns" aside, it will cost the taxpayers much more to handle the people who are forced on to welfare than it would if only their Medical costs were paid.

"Our records indicate clearly," Mr. Ginsberg said, "that if you're poor and in poor health, you are five times as likely to end up on welfare than if you're poor and in fairly good health. Now what kind of sense [does the Medicaid cut make] from a dollar and cents point of view?"

Sees Lower Level of Care

As a result of the cuts, Mr. Ginsberg said, "the medical care to people just above welfare is now at a lower level than before the whole Medicaid program started."

This was so, he said, because the patient would now have to pay for clinic services that were fre before Medicaid started.

In another matter Mr. Ginsberg said that only about 35,000 jobs—5,000 fewer than last year—would be available in the summer youth program because of a cutback in Federal funds. He defended the decision to cut back the jobs rather than the number of hours each youth is employed as the best choice among "undesirable alternatives."

Cutting back the hours was rejected, he said, because it would have been a substantial reduction in pay and a disruption in activities.

"If you're on a day camp," he said, "or on a program of that nature, what do you do? Walk off your job at 11 o'clock Friday morning?"

Although he termed the job cut "serious," he said he had hopes that a "concerted effort" in the private sector would provide more jobs there.

Despite the problems in the department he replied with an emphatic "heavens, no!" when asked if he was disillusioned over his job.

New Bus Line Links Inner City and County

By Alexander Ward
Washington Post Staff Writer

An experimental bus route designed to help inner-city residents reach their jobs in Montgomery County was initiated yesterday by D. C. Transit.

The route, designated as X-6, begins at 9th Street and Constitution Avenue nw. Buses will leave from there at 6:32 and 6:46 a.m. and follow the regular "Silver Rocket" line along the Georgia Avenue corridor, ending up at Aspen Hill Road and Connecticut Avenue.

Unlike the express rush hour service set to begin Monday between the District and Prince George's County, this route is aimed only at improving service for those who travel out of the city in the morning and back at night, a transit official said.

Passengers will be charged normal fares for the service—the cost of making the entire trip one way is $1.05. Running time for the trip is 45 minutes in the morning and an hour in the afternoon.

The return trip begins at Aspen Hill Road at 4:22 and 4:38 p.m. The service makes all the scheduled "Silver Rocket" stops.

The route, which is on a 180-day trial basis, is not being subsidized by the Federal Government, as is the Prince George's service.

The idea for the route originated with Henry Bain, of the Washington Center for Metropolitan Studies, who made a study of Montgomery County's transportation needs for the County council.

"Bain recommended that a bus service to help the excessive flow into the County be started," said Richard Dawson, director of traffic for D.C. Transit, "so that's what we've done."

The route has a temporary authorization from the Washington Metropolitan Area Transit Commission, and any losses incurred will be taken out.

The fund was established in 1967 to help finance such experiments.

The criteria for maintaining the route will be its popularity. Passengers on yesterday's morning's first run were scarce, but Dawson believes business will pick up when more people find out about it.

BRITAIN ABANDONS ANTISTRIKE PLANS

Wilson Drops Legislation in Return for Unions' Pledge for Internal Reforms

By Reuters

LONDON, June 18 — The Labor Government tonight dropped its controversial plan to introduce penalties for wildcat strikes tonight. But it received a solemn promise from labor unions that they would impose self-reforms.

The decision was viewed here as an about-face by Prime Minister Wilson after months of tough talk about wildcat strikes.

Today's agreement was reached in a daylong conference between the Prime Minister and chiefs of the Trades Union Congress, which speaks for nine million British workers. It followed a yearlong controversy that threatened to split the ruling Labor party.

The proposed legislation would have curbed wildcat strikes by imposing fines on workers who refused to obey an order for a 28-day cooling-off period. The law, submitted by Employment Minister Barbara Castle, will be dropped from the Government's legislative program.

Government Harassed

Union leaders in exchange agreed to sign a solemn and binding promise to deal with Britain's frequently anarchic industrial trouble.

The agreement announced tonight had the appearance of a face-saving alternative for the harassed Labor Government, which has been beset by defeats in special elections, internal disaffection in Parliament and the prospect of a revolt by the unions.

The unions, a major power base for the Labor party, had threatened industrial chaos if the Government went ahead with fines on workers for unofficial walkouts.

Mr. Wilson said tonight the Government would go ahead with a general bill on industrial relations in the next Parliamentary session, starting in October, but would cancel plans for the anti strike legislation.

Both items arose from the report of an inquiry commission in June, 1968, condemning both management and unions for creating a situation of "indecision and anarchy."

The commission, headed by High Court Judge Lord Donovan proposed sweeping reforms.

Among its suggestions were penalties against wildcat strikers. These and reforms covering wage negotiations, working agreements and conditions of hiring were later put forward as an official document, "In Place of Strife," by Mrs. Castle.

The unions agreed to the reforms except for the proposed fines on wildcat strikers.

For weeks the Government refused to budge on this issue. The promise by the union leaders tonight means that they will assess the facts in an unofficial dispute that involves large numbers of workers or serious economic consequences.

The unions agreed to the reforms except for the proposed fines on wildcat strikers.

For weeks the Government refused to budge on this issue. The promise by the union leaders tomorrow means that they will assess the facts in an unofficial dispute that involves large numbers of workers or serious economic consequences.

The union will insist on a series of settlement procedures and defiant unions could be suspended or expelled from the organization.

Mr. Wilson said the Government was "very satisfied indeed." He will make a statement in Parliament tomorrow.

Sun., June 8, 1969 ST. LOUIS POST-DISPATCH

Job Need Rises On School Closing

St. Louis public schools will close Friday and about 23,000 high school students will be at liberty — available for jobs, available for education and recreation programs, available for a wasted or even destructive summer.

Last year the St. Louis branch of the National Alliance of Businessmen placed about 2000 young persons in jobs; state, federal and local agencies provided employment for about 8000 youngsters. But a study made last fall by the National Committee on Employment of Youth not only estimated that 5000 additional jobs would be needed this summer but criticized the way the problem was being met here.

The study of 20 major cities made by the private, nonprofit committee said that the summer job program here was hampered by the large number of agencies participating and the lack of co-ordination between them.

No Central Agency

St. Louis had no central agency or administrator that gave specific orders and determined later whether they had been carried out, ther eport said.

"If some of the leaders who worked on their own this year will take orders next year, then the 1969 effort cannot help becoming an outstanding success," the report stated.

The problem of too many chiefs and not enough Indians does not seem to have substantially lessened, some of those involved say. All believe that co-ordination is essential and yet none is optimistic that it will ever come to pass in the form of a central authority.

"You look at all these agencies that are tring to get jobs for kids — the Urban League, CORE, the NAACP, religious organizations, the YMCA — the don't want to funnel all the job openings they dig up to one central agency," said a person deeply involved in the summer job program.

"And it's the same with federally funded programs. Everybody has a board of directors he's responsible to, a board that likes to see a list of job pledges secured and job openings filled. It's just human nature — everyone wants credit for what he's done."

Some believe that this approach can lead to a situation both discouraging to the job applicant and irritating for the businessmen who make the jobs available.

Lond Waits

A young person may wait long hours at Missouri State Employment Services before his application is processed. If he is sent on lengthy bus rides to apply for jobs that turn out to have been filled through another job program, it is difficult not to become discouraged.

The employer, also, may encounter frustration. One of about 80 persons soliciting job pledges on behalf of the NAB may be followed by representatives of several other job-seeking organizations. An NAB spokesman said many employers had complained about multiple solicitations.

Some of the organizations engaged in bringing the job and the youngster together have specific criteria for the latter.

Lawrence Copenhaver, director of the NAB program this summer, said, "They must be young ladies and gentlemen, 16 to 21 years old, who are in school and returning to school.

"They must meet one of the following requirements: Be a member of a family receiving welfare or a family with an income below the poverty level." (A family of four isconsidered to be in poverty if the annual income of the whole family is not more than $3300.)

"Or the youngster must live in or attend school in a low-income area, be a former member of the Neighbor Youth Corps or the Job Corps, be a ward of the court or live in an orphanage. The last criterion is that the boy or girl be genuinely disadvantaged, especially a member of a minority group," Copenhaver explained.

Job Pledges

He said that the NAB had received more than 2000 of the 2200 job pledges that are its summer goal. Job pledges received by NAB solicitors are turned over to Missouri State Employment Service, which verifies the pledge and converts it into a job order.

The YMCA, which last summer placed 2837 youngsters in jobs, has different criteria for those who participate in its Youth Achiever in Industry program.

Although the YMCA tries to place needy boys and girls, it aims first for those who are well recommended by high school advisers.

"We like to see that they've had some work experience, too," said James Covington of the YMCA. "We like to think of havingthequalitykid s — we like to think of this as a program for the high achievers."

The YMCA shares its applications,distributed through the schools, with the Neighborhood Youth Corps. Covington said that 2176 of the 6050 he has received have been turned over to the Corps because "the kids met the Corps' strict poverty requirements.

Urban League Active

The Urbban League is also involved in the job hunt. Wilbur Stewart of the League said, "Our philosophy is primarily toward employment for the mothers and the fathers who have to take care of these kids. Butthis year we're co-operating with the Mayor's program — they're going to send us lists of job openings and we'll fill them with our kids,"he said.

The Urban League does not establish poverty requirements for those who apply. "Anybody looking for a job has a need," Stewart said.

Jesse Horstman of Human Development Corp. said that the federally-funded poverty agency had no specific job program. "We're interested in social change not just employment per se, but if jobs are available through HDC-funded programs we'll try to fill them," he said. "If a church or a neighborhood group wants to run a recreation program, say, we suggest that they make the jobs that go with it — counselors, maintenance workers — available to Neighborhood Youth Corps kids." The Corps is funded by the Department of Labor through HDC.

Some organizations that had participated in the summer job program have given up. Catholic Employment Service attempted to find jobs for youngsters last summer, "but we were not at all successful. We send them to the YMCA now," a spokesman said.

The director of Jewish Employment and Vocational Services said: "We tried to get job pledges and couldn't get any at all. Youngsters are better off going through family or neighborhood contacts if they have any."

GRAPE STRIKE (continued)

aries" who ultimately aim to expropriate their property. Their economic motivation in fighting the boycott is compounded by a conviction that they are fighting a battle for the right of free enterprise.

The halting efforts of the growers and the union to reach some agreement also points out the lack of any formal ground rules governing labor relations in agriculture, which is not now covered by the National Labor Relations Act.

The conflicts over these two issues—the contract between the union and the growers, and the long-range rules governing agriculture—will not be resolved quickly. But labor experts agree that la causa—the movement of farm workers for economic security and human dignity—has made a significant step forward.

Summer Classes In Office Skills

A special summer program for recent high school graduates will be offered, starting tomorrow, by the Urban League's Clerical Up-grading School at 4422 Easton Avenue.

The program was made possible by a special grant from the Charitable Trust Fund of Anheuser-Busch, Inc. It will enable participants to acquire clerical skills and learn office procedures. Upon completion of the program July 3, the Urban League will help the young people find positions.

JUN 18 1969 ST. LOUIS POST-DISPATCH

Mayor Cites Decline In City Youth Program

The city's summer education and employment program for ghetto youth is about half as successful as last year, Mayor Alfonso J. Cervantes said yesterday.

The Mayor told members of the Council on Human Relations that "there seems to be a stiffening in the community toward aiding the program. Neither funds nor job offers are coming in this year as well as last year.

"I realize that last year the program was new and everyone was enthusiastic about helping. But the problems in the ghetto remain with us this year, and we need as much help and more to aid ghetto youth."

The Mayor said that his brother, the Rev. Lucius Cervantes, "has been working twice as hard this year but accomplishing about half as much."

A spokesman for the Mayor's Council on Youth Opportunity, headed by Father Cervantes, said the council hoped all programs combined would produce a total of 15,000 summer jobs.

The figure is 4800 more than the 10,200 jobs obtained last summer.

The local goal of the National Alliance of Businessmen is 2200 summer jobs for disadvantaged youths.

Asked today about the Mayor's comments, Father Cervantes said the statement about accomplishing only about half as much as last year might be "a little strong." However, he said he believed the community should do significantly more.

He said hope for exceeding last year's total of 10,200 summer jobs was pinned primarily on $500,000 in Model City money earmarked for such jobs if the program is funded and on an application for $363,746 in interim assistance money from the Federal Government.

"When you realize that we've had some 180 programs lined up since January and that we've had more people contacting businessmen than before, I think you'd have to say the response has been less than we'd hoped," Father Cervantes said.

July 17, 1969

Mr. John L. Crain
Senior Transportation Analyst
Stanford Research Institute
Menlo Park, California 94025

Dear Mr. Crain:

Your letter of July 3 enclosed a Stanford Research Institute check, #P-109092, for $106.95. This was to reimburse me for travel expenses to Washington, D. C. on March 12.

Today I received a second check for the same amount (Check #2992) which I am returning to you with this letter.

You had indicated that you had requested some special handling of this matter to avoid further delays and I would guess that was done and now the routine procedures have sent me a second check.

Sincerely,

Emory F. Via
Director
Labor Program

EFV/km

Enc. - Check $106.95

July 14, 1969

M E M O R A N D U M

TO: Ruth House Vick

FROM: Emory F. Via

- o -

The attached check for $106.95 is to reimburse SRC for that portion of my expenses for a trip to Washington on March 12, 1969 to consult with the Department of Transportation. The meeting was arranged by the Stanford Research Institute. Therefore, the check is drawn on their account.

I have already been reimbursed for my expenses on that trip.

MENLO PARK, CALIFORNIA 94025

July 3, 1969

Mr. Emory Via
Director of Labor Programs
Southern Regional Council
5 Forsyth N. W.
Atlanta, Georgia 30303

Dear Mr. Via:

Attached is a check to reimburse you for your expenses in participating in the panel of transportation experts that met in Washington, D.C. on March 12.

I apologize for the delay in sending this. We were first slowed by receiving the written approval from the Department of Transportation, then because of a change over in the SRI computerized accounting systems to new equipment. To avoid additional delays, I requested that the attached check be written and mailed immediately.

Thank you again for your assistance. Your expert advice to the Department of Transportation has affected policy and specific decisions.

Sincerely,

John L. Crain

REMITTANCE ADVICE - DETACH BEFORE DEPOSITING CHECK

March 26, 1969

Mr. Andy Andryshak
Urban Mass Transportation Administration
U. S. Department of Transportation
800 Independence Avenue
Washington, D. C. 20590

Dear Mr. Andryshak:

My out of pocket expenses for the trip to participate in the panel on impacts of non-conventional carriers are:

Air transport (Atlanta-Washington-Atlanta)	$88.20
Ground Transportation	18.75
Total	$106.95

I was very sorry to have to leave the meeting early for other pressing business which was scheduled, beyond my control, for the same day. I would be happy to be reimbursed for only half of the above expenses or simply to have my organization assume the total.

Sincerely,

Emory F. Via, Director
Labor Program

TRANSPORTATION NEEDS OF THE POOR

by

Oscar A. Ornati

Chapter I of a forthcoming book to be published
Summer 1969 by Praeger Incorporated

CHAPTER I

INTRODUCTION

To know how the poor can get jobs means to know how they can get there. For the poor of the second half of the twentieth century this calls for focussing on the city. In the city it calls for turning to the anomalies of the public transportation network. Indeed, while odd that, e.g., a resident of central Brooklyn traveling to nearby industrial districts only four miles away, via one of the Nation's most efficient transit systems finds the journey longer and more complicated than a trip to the Bronx, some fifteen miles away, it is true. Anomalies of this type appear throughout American cities and, in most cases, they relate to the journey between poverty areas and the centers of employment where the residents of such areas might conceivably find jobs.

Policies aimed at reducing employment-related poverty must respond to the self-evident fact that travel inconvenience is a barrier to employment. How much of a barrier it is, we do not know. Nor do we make any estimate of the degree to which employment-related poverty can be reduced by increasing the convenience of travel. Nor is it argued that because a route is complicated, time consuming or requires payment of multiple fares, it represents a sole or a major or a permanent barrier to a job-holder. Simply put, the premise states that: accessibility as perceived by a job-seeker, is a determining factor of job search and job keeping patterns; this would be

particularly so for the poor, who are more likely to be unfamiliar with a city's complicated transportation network. Given this premise the first step is to identify the specific barriers that exist.

That barriers will exist in Los Angeles, the Nation's most expansive and sprawling city, does not come as much of a suprise. But what about older, more compact New York? Having the world's largest and most efficient, if not the most commodious, transportation system, one might predict that no significant barrier will exist. This would be in error as analysis of patterns of intrametropolitan development suggest the opposite.

If significant barriers or inconveniences in travelling to employment locations are found, the second step to which the analysis must turn to is the question of what to do about it. The doing something about it involves many considerations of financing, planning, public administration, political organization and so on. Clearly the needed action will differ from city to city, yet some similarities exist. We will turn to these after a general discussion of intrametropolitan developments as they bear on the accessibility of job locations from poverty neighborhoods.

INTRAMETROPOLITAN DEVELOPMENTS

What is known about spatial organization of the urban economy has been

the fruit of a crescendo of policy problems associated with the regulation of land resources, the provision of public facilities and the work of local planners. The efforts of the latter have led to "a realization that the internal organization of the city and the directions in which it tended to change were manifestations of powerful social and economic factors that determined land use patterns, the movement of goods and people and the distribution of infrastructure." /1 Yet this realization has not brought with it a unified theory with which one can truly move beyond description and onto which one could build an integrated explanation of accessibility to employment sites. Indeed, Edgar M. Hoover who has most meticulously disected the urban organism, finds no ideal or equilibrium state. For him spatial structure "represents a snapshot of current states of mutual adjustments. Impacts of one change upon another, physical facilities, habits, social and business ties, and political commitments are entailed." /2

What is known about the urban structure is drawn from the theory of industrial location, market area analyses, rent theory, etc., linking the bits and pieces together -- and they are many as the literature is large and elegant -- give us at least one stable datum -- the notion of the Central Business District -- and a set of recognized relationships which can be adapted to explain a multitude of urban conditions linked into the spatial context.

Clearly, to study the relationship of poor people's residences and their access to employment sites, we must look at the major determinants of household and firm location. This can be done in the aggregate for the general experience of American cities. Following a little known, but breezy, article by Charles Leven, /3 a gross summary of what is known follows:

A Synoptic View of Urban Spatial Development

Two established facts, (1) that American cities continue to grow larger and (2) that to sustain a labor-force large enough and varied enough to permit industry-mix shifts, cities have to have a population of at least one quarter million, set the outer limits of our "model-analysis-description." Indeed we are only interested in large cities as it is only there that difficulties of access to job locations arise.

The relationships involved in the analysis are: (1) the relationship between technology and the cost of land, and this is viewed as making space cheaper as the individual household and employer moves away from the city's center; (2) individual preferences as to "access", and this is viewed as leading individuals to prefer the time-distance between where they live and where they work or play to be smaller rather than larger; (3) the taxpayer's preference for paying lower rather than higher prices for increasing quantities of public services

of all types, including public transportation services; (4) the preference of people to live near people that are like rather than unlike them, indeed it has been shown that most people like to maintain "social distance".

With the above considerations in mind, a synopsis of urban development with reference to transportation can be traced through five typical stages.(See Fig. 1)

In stage one (Fig. 1A) the city is condensed, the Central Business District (CBD) is compact. The rich occupy land with advantageous accessibility and settle right around the CBD. The poor take the cheaper low access land and settle around the rich residences. Most employment opportunities are located in the CBD and right next door to where the poor live, indeed most manufacturing establishments that service the CBD settle where land is cheaper. The poor walk to work, with some of them walking through the richer residential areas. "This is the Chicago of the 70's and 80's -- the great days of LaSalle Street and Prairie Avenue, surrounded by the stock yards". /4 The city's internal transportation system provides no problem and has little influence in determining locations.

In stage two (Fig. 1B) the construction of large avenues with streetcars and later buses, and the commuter railroads play an important role. Middle income groups split off into outlying city locations while the

FIGURE I

A Synoptic View of Metropolitan Growth

The rich live at high access locations around the CBD and the poor cluster about job locations.

FIG. 1a

The middle class split off to outlying central city locations serviced by the internal transportation grid. The rich relocate to commuter suburbs serviced by the railroads.

FIG. 1b

The rich fill the first suburban ring. The middle class and the poor take over most of the central city.

FIG. 1c

= middle income groups

= lower income groups

= employment locations

FIGURE I (continued)

The middle class begins to escape from the central city and sets up the second suburban ring. Some job locations emerge in the outlying parts of the central city as well as in the outer suburbs. Access to CBD is easy but movement within the central city is difficult.

FIG. 1d

The middle class dominates the first and the second suburban ring. Some businesses relocate in the second suburban ring. The rich establish a third suburban ring. For the ~~poor~~ still mostly in the center of the city access to the new suburban job location depends upon car ownership.

Fig. 1e

Areas of urban renewal

poor are brought into closer contact with the rich that live around the Central Business District. As the railroads have reduced access costs and to regain the social distance which they lost, the rich leapfrog over the middle class residences and move out to outlying commuter suburbs that spring up along the railroads' radials. Most employment sites remain in easy access to the poor. A few employment centers develop outside the areas inhabited by the middle classes not far from the railway lines; they are easily staffed, provide no problems and are the harbingers of later stages. Stage two is well represented in the development of New York in the period from the turn of the century to the early 1920's -- in "the apartment houses of the Bronx, the six family flats of Chicago, the two family flats of Cleveland" /5 and the two story houses of Cambridge or Somerville around Boston.

In stage three (Fig. 1C) automobile ownership by the higher income groups becomes determinative of the city's spatial organization. The rich keep moving out of the city to fill a first suburban ring. Thereby they maintain their social distance, escape the tax burden of the central city and give a boost to the creation of suburban governments. The inner ring of wealthy residences is narrowed, as, on one hand their mansions are taken over by the businesses of the CBD, and on the other hand by the poor. New York City's Fifth Avenue, with its stores and hotels moving up to 59th Street and the slums of Harlem

moving down to 108th Street, is almost perfect paradigm of this phenomenon.

In stage three the poor and the middle class take over almost all of the central city. Work places rapidly increase in number and in distance from the original CBD. Some work locations develop in middle class areas and occasionally outside the first suburban circle. For most of the poor access to the work sites is still not a problem as most jobs are linked by the transportation network developed in stage 2.

Job locations in middle class areas are also generally accessible as they have developed mostly along the avenues used by the middle class to move back and forth to the CBD. Whether a city's road network is a grid or a radial matters little as buses, streetcars and subways are plentiful having been built in response to middle class pressures. Stage three represents most of the cities of the 1930's. The diagram, were the circles to go all around, being a good representation of Indianapolis.

Stage four (Fig. 1D) is characterized by widespread (except for the poor) automobile ownership and by the leapfrogging of the middle classes who now create a new, the second, suburban ring. The second ring develops because, like the rich, the middle class wants to

maintain its social distance and, again, because access costs have gone down. At stage four there is still only limited outward movement of job sites, yet the poor's access to them has worsened. The public transportation network, whether grid or radial, is less effective as the new employment locations are set up in response to automobile and truck routes -- indeed now the expressways replace the railroads. Travel into and out of the CBD is easy and rapid but travel within the central city is difficult. Travel across and within the second suburban ring is almost impossible without an automobile. To go from the expanded central city poverty ring to work in the middle class suburbs is difficult as there are no systematic political pressures for helping those involved in "reverse commuting." Stage four is the prototype of the large city in the late forties and early fifties. Modified forms of stage four represent contemporary urban places of between one half and a million people. In the late sixties, Rochester, New York; Albuquerque, New Mexico and Denver, Colorado, all qualify as stage four cities.

Stage five (Fig. 1E) represents the large metropolitan centers of the 1960's. It embodies the repetition of the dynamics of earlier stages: the rich move out of the first suburban ring -- increasingly taken over by the poor at the near end and the middle class at the far end -- to escape to a new, third, suburban ring. In the second

suburban ring the middle classes are not faring well as their public services, mostly schools for which they clamor - are costlier. To broaden the tax base of their towns and unincorporated areas, they invite in industry from the central city. Businesses are eager to move out as transportation in the central city is getting costlier, municipal services are deteriorating under the strain of increased density of the poor population and of their demands. New suburban industrial districts get formed in the less populated parts of the second suburban ring.

The residential locations of the poor and their work sites are now no more linked by transportation. Indeed, expressways that provide access to the CBD have improved but the poor do not benefit from them. The central city transportation network remains unchanged in size and routes when it does not deteriorate from overuse and obsolescence. Where it expands, it mostly expands to take care of the needs of the middle class in the first suburban ring. The poverty areas of the central city show little change except for the beginning of the poor's outmigration often accelerated by urban renewal along the expressways. Some of the poor move out to the second suburban ring and settle in the older and denser parts thereof. Having moved to the suburbs they have improved their situation somewhat. In most cases they are still far away from the industrial parks that provide the bulk of

the unskilled employment potential because these have settled in the least densely populated areas and there still is no way to move across and within the second ring unless it is done by automobile.

In the model sketched above, time and space intertwine. It shows that job sites are least location bound over time, that the residential locations of the poor are -- in respect to job location -- more rigidly fixed. From it we can say to the poor, if you came this way taking the route you would be likely to take, from the place you would be likely to come from ... going to work is hard. The measure of fit of the hypotheses, implied in the dynamics of the model, will vary from city to city with the history, the physical contour, the industry-mix and employer-size-mix of each. So will vary the travel inconvenience of the job seeker. If potential employment sites are concentrated, the task of the job seeker is eased once he gets to the general area. Holding on to jobs when these are hard to get to is easier when job sites are contiguous as transportation habits develop faster (car pooling is easier) and as, eventually, the public transportation network adjusts to service concentrated employment locations. When, on the other hand, jobs are scattered the problem of access to job sites is compounded and particularly so for the job seeker. In New York City, for instance, particularly outside of Manhattan,

there is no one area of unskilled work, nor any one large scale employer; typically New York's manufacturing, the usual source of blue collar work, is smallscale and, in recent years, has become increasingly decentralized. This means both that it is pratically impossible for any one individual to check significant numbers of possible job openings; and by the same token, that the probability of finding a job at any one firm is fairly small. The added travel inconvenience of searching for employment in cities with scattered and small job sites thus can be easily assumed to add significantly to the time and cost for the poor and therefore to be a meaningful barrier to employment.

Ethnic makeup and degree of residential segregation of each city will also influence the degree of fit of any test of the above hypothesis. The residential segregation of Negroes has become one of the most important issues involved in the "equality" revolution of the day. Doing away with this form of segregation, it is argued /6 will contribute to the reduction in white-non-white differential in employment opportunity. As far as this analysis is concerned what needs clarification is whether there indeed is greater difficulty in job accessibility between low income whites and low income non-whites. Related issues, such as whether residential segregation itself reduces the total stock of available jobs, discrimination in employment, schooling, etc., are not part of this

particular study.

The issue of whether differential accessibility to job location between whites and non-whites exists can also be recast by asking whether the historico-spatial development traced earlier suffices or not to predict the presence of a racially linked differential job-accessibility. So posed the answer appears to be negative. Indeed, contrary to popular belief, residential segregation of Negroes cannot be explained primarily in terms of average income and occupational differential between whites and non-whites. Both the Taubers /7 and Pascal /8 have shown that little of the Negro residential segregation vis-a-vis the white population can be so explained.

To shape our analysis to suit the problem rather than pursuing it as an intellectual challenge we must trace the issue further through two related questions: 1) is car ownership -- which we have seen to be important in shaping urban spatial distribution and in general travel to work patterns -- differentiable in terms of race, and 2) are the job search patterns of non-whites different from those of white poverty area residents? The answers are clear: keeping income constant Negroes, on the average own fewer (not more as the mythology about Blacks buying pink Cadillacs would have it) cars, and non-whites have more extensive--although

less successful--job search patterns. Thus we can conclude *a priori*, even though our previous analysis did not suggest it, that job accessibility presents more of a problem for non-whites than for whites and that inconvenience in travel to work sites are compounded for the Negro job-searcher.

THE METHODOLOGY

The general methodology through which one can establish the poor's relative case of access to job sites is simple and easily applicable to any large center. Fundamentally, what is called for is the overlaying of three maps: one pinpointing employment locations particularly fitted to the employment potential of the poor, one identifying residential areas of the low income population and one tracing the routes of the public transportation network.

There are complications with the construction of each of these maps and variations among cities in the availability of needed data. Employment locations can be derived from land use or zoning maps supplemented with information drawn from local business directories. Such sources generally yield only data as to employment locations; they need adjustment to identify locations of employment particularly open to the poor. To achieve the latter the investigator can be guided by general notions as well as specific data on the industry's proportion of skilled to unskilled, and on

the average wages paid in the industry. The judgement of the investigator is, of course, crucial.

The residential areas of the low income population can be plotted from census tract data through the cumulation of adjacent tracts of low median income. What is a "low" median income -- to say nothing of the problem of the peculiarities of the income distribution below the median -- is as difficult as deciding what being poor means. In other contexts I have discussed extensively the whole problem of the definition of poverty and of how such a definition affects the problem under discussion. /9 Here suffice it to say that the choice of the income cut-off must reflect social judgements, the particular city's overall income average and, that ideally, instead of one income cut-off one should use several to identify the "band of poverty" involved. In many cities the identification of poverty neighborhoods is already available in the work of various agencies involved in anti-poverty activities. In certain cities data are available to distinguish areas of first, and second poverty magnitude. This is the case in New York City and in the case study presented in this volume much reliance has been placed in the Human Resources Administration identification of areas of poverty of first magnitude (See Appendix A for the detailed methodology.)

Maps describing the routes and the stops of the public transportation network are generally available from the local transit authority. In other cases they either are not existent or they cover only routes serviced by some form of fixed plant such as subways or trolleys. In such cases the investigator must construct, either directly or in combination with existing maps, a new map.

The overlayed maps will readily indicate whether accessibility of employment sites through the public transportation network exists or not.

Establishing the pure and simple existence of accessibility does not suffice. A judgemental factor as to its convenience for the poor--relative to the non-poor--is also needed. The relative convenience of a public travel system is determined by time, cost and complexity. These factors can be established by drawing boundaries along these three dimensions. In addition, in cities with large areas of poverty, detailed studies of the transportation situation in specific poverty neighborhoods help throw light on the situation. In the New York study the largest conglomerate of first magnitude poverty areas was redivided into four subareas. (See map in Appendix A) each of which is locally recognized as having certain traits of neighborhood commonality.

In the following chapters the situation of New York City and the transportation requirements of residents of poverty areas is discussed in detail.

Vicki Reed

CITY REPRESENTATIVES TO MEET:

SEEK SOLUTION TO CENTER CITY TRANSPORTATION PROBLEMS

Federal and city officials, transportation consultants, architects, private developers, and advocate planners from more than 34 cities will meet November 24 and 25 in Washington, D.C., to discuss means of solving center city transportation problems.

The meeting is sponsored by Urban America Inc. as part of the U.S. Department of Transportation Center City Transportation Program. The Program is designed to nudge cities into thinking about and achieving transportation improvements that are community-inspired and supported, but nationally coordinated.

The center city houses the primary decision-making bodies of society -- the local government, the business and financial community, educational and cultural institutions -- yet faces increasingly severe constraints on the movement of people and goods.

(more)

Transportation development has failed to keep pace with rapid center city growth.

Urban America's role in the Center City Transportation Program is to establish an intensive process of communication and national participation in the development of concepts, principles, and procedures for center city transportation planning, design and implementation. Part of that process involves a series of seminar-workshops that will offer an opportunity to evaluate the status of current center city demonstration projects, innovations in transportation hardware, mechanisms for financing transportation development, and issues unique to particular types of center city areas. The first three seminar-workshops dealt with the problem of defining transportation needs and of developing criteria for evaluating transportation projects.

The Washington seminar will provide participants an opportunity to consult directly the officials from various federal agencies who are responsible for programs concerned with the development of urban areas. Guest speaker will be J. Dorm Braman, Assistant Secretary of Environment and Urban Systems for the Department. Urban Mass Transportation Administrator Carlos C. Villarreal will give the keynote address. Other UMTA officials include: William B. Hurd, Assistant Administrator of the Office of Program Operations, who will explain the capital grant and

(more)

technical studies program; H.W. Merritt, Assistant Administrator of the Office of Research, who will discuss his agency's research, development, and demonstration grant program; and Gordon M. Murray, Assistant Administrator of the Office of Program Planning, who will outline legislative alternatives involved in planning and implementing mass transportation improvements.

At a previous seminar, Villarreal said that the Center City Transportation Program "recognizes the lack of attention given by the Federal Government to the movement of people and goods within the downtown areas of the Nation's cities." If legislation is passed increasing funds for urban mass transportation programs, the study that Urban America is conducting will have laid the groundwork for their use by helping the Department determine programs and policies to solve the urban mass transportation crisis.

Urban America Inc. is a national, nonprofit, membership organization dedicated to improving the social and physical environment in the nation's cities through a broad range of programs. Its Center City Transportation Project is backed by a $270,000 grant from the Department for a 15-month period ending in June, 1970.

In addition to the Urban America Project, which includes 21 cities, a consortium of consultants led by Arthur D. Little will carry

out demonstration projects in five cities. The U.S. Conference of Mayors and the National League of Cities are studing non-technological barriers to transportation solutions in eight cities.

M- Transportation

They Grease Their Own Wheels

By I. WILLIAM ARSHACK
and DON MCGHEE

Detroit, the automobile capital of the world, is short of transportation—at least for inner-city residents. Many of them find it impossible to work in the suburbs, where so many of the good-paying jobs are these days, because they cannot afford cars and adequate public transportation is not available.

Now some of these men and women have turned entrepreneurs so they can continue to be workers. They operate their own busline so they can get and keep jobs on the fringes of the auto city.

Formation of the innovative transportation cooperative was spurred by Garnell McAfee, an energetic auto plant union official. As a United Auto Workers bargaining committeeman at a suburban plant located 28 miles from Detroit, McAfee saw that poor transportation was a major cause of tardiness, absenteeism, short paychecks, and often dismissal from the job. No public buses ran from Detroit to the plant. Makeshift arrangements for a ride to work often broke down for those who did not or could not own a car.

McAfee and 14 others from his union local raised $6,000, mostly from individual contributions, and in July 1968, the United Brotherhood Club, Inc., bus service was born. A 1959 schoolbus was purchased for $125. Volunteers spent hundreds of spare-time hours reconditioning it. The engine was rebuilt; the outside was repainted; air-conditioning was installed; card tables, a television set, stereo music, and draperies were added.

Mr. Arshack is the Michigan Employment Security Commission coordinator for Detroit's Concentrated Employment Program and Mr. McGhee is an information officer for the Commission.

Wheels *continued*

By October, the old schoolbus had been transformed into a luxury van and was displayed in the parking lot of the suburban plant. Two hundred employees joined the Brotherhood club. Each bought a $5 share of stock and was assessed monthly dues of $5. Each new member also agreed to pay $5 a week once he began riding the bus to and from work. The weekly fare was to remain constant, whether the member worked 5, 6, or 7 days per week.

The company credit union agreed to deduct dues and bus fares from members' pay and send a monthly check to the United Brotherhood Club. ("As a side effect of this arrangement, many members have started a regular savings account with the credit union," said McAfee.)

With 200 members, the Brotherhood needed more equipment and facilities. It obtained a $50,000 loan from a local bank, bought a building to serve as a garage for storage and repairs, and added seven more used schoolbuses. McAfee took a leave of absence from his union duties to devote full time to the project. Again hundreds of hours in volunteer work were spent in renovation. The building was rewired. Doors were raised to allow entry of the buses, which were completely rebuilt, inside and out. McAfee and his volunteers worked as carpenters, mechanics, electricians, plumbers, and masons, getting the old building and vehicles ready for operation.

Regular bus service to the suburban plant got underway late in 1968. Initially, only 88 members signed up as daily riders. They were transported on two buses driven by men employed at the plant, and the buses were left in the company parking lot during the day.

A number of central points were designated for passenger pickup. Riders were assured that if they became ill on the job or had an emergency call from home, a private car would be dispatched for immediate transportation.

An appearance by McAfee on "Job Opportunity Line," a local public service television program coordinated by the

Labor Dept. photos by Billy Rose

United Brotherhood President Garnell McAfee discusses operations with Jack Tasse (standing), member of the board and one of the program's originators.

When a driver fails to show up, McAfee often takes time out from running the entire operation to run a bus. As do the other drivers, McAfee uses a citizens band radio to contact riders and let them know he is on the way. Some passengers have bought small citizens band receivers that they carry in their pockets and purses.

Conversation and cards are two of the passengers' favorite pastimes.

Mechanic Sandy Evans works on a motor block.

Michigan Employment Security Commission, and a number of newspaper stories brought the Brotherhood to the attention of people outside the plant where it was formed. Some local groups offered financial support. And requests began coming in from other plants and organizations for transportation service.

The Brotherhood has done what it can to meet the demand. In June 1969, the State employment service arranged to use the Brotherhood bus service to transport trainees under a Job Opportunities in the Business Sector (JOBS) contract to the employer's suburban plant. The facility was not served by public transportation and none of the potential trainees owned autos.

The employment service persuaded the employer to establish a payroll deduction plan for payment of the transportation fees due United Brotherhood. It is doubtful if the trainees could have taken the suburban jobs without these special arrangements.

In September, 22 young men from the inner city were hired by Hawthorn Metals, a suburban firm, at a starting rate of $3.09 per hour. Public transportation to the plant was not available. The employer conducted his interviews at the Michigan State Employment Service's Youth Opportunity Center in downtown Detroit. Arrangements were made with the United Brotherhood to provide bus service to those youth who had been offered jobs but had no way to get to work. Now each afternoon a red and white United Brotherhood bus stops in front of the Youth Opportunity Center to pick up these young men and take them to their jobs.

In late summer, when model changeovers temporarily closed the auto plants and some of United Brotherhood's riders were out of work, the red and white buses were not idle. They were used to give hundreds of inner-city children transportation to day camps, the local zoo, beaches, and matinee performances in downtown theaters.

McAfee emphasizes that the cooperative bus service is as helpful to the suburban employer as it is to the inner-city worker or jobseeker. "We customize transportation to the needs of the individual plant," he says. "The problem

workers face in finding a way to reach the many well-paying production jobs located in the suburbs is obviously the other side of the problem the employer encounters in filling jobs."

Even if public transportation were available, McAfee points out, the timetable of the buses would not necessarily coincide with the plants' work shifts. Inner-city residents traveling 10, 15, or 25 miles to reach suburban plants usually find it necessary to transfer from one bus to another, a very time-consuming procedure. On the other hand, United Brotherhood bus service is direct and nonstop.

Passengers board the bus in Detroit for the 25-mile run to their jobs in an electronic assembly plant outside the city.

McAfee says the cooperative has been especially valuable to women. Before the bus service, he says, inner-city women simply did not bother to apply for well-paying jobs in the suburbs that were open to them. The jobs were too far away, and lack of transportation presented a seemingly total barrier. According to one woman now riding the coop buses 25 miles to work, city jobs usually do not pay enough to cover babysitting and other expenses. Now she makes more than $100 a week.

Regular busdrivers are now hired for most runs, to allow fuller use of the bus fleet. "It's a waste to leave them parked on a company lot while the driver and his passengers are putting in their 8 hours," McAfee says. "But these full-time busdrivers are also mechanics. They must be able to make emergency repairs enroute, if something goes wrong." The driver-mechanics also perform regular maintenance and repairs on the buses.

United Brotherhood's maintenance and service capabilities have expanded along with its transportation operations. It has opened a gas station midway between Detroit and the plant where the idea of the cooperative was conceived. The station, which is open to the public, makes it possible to buy gas for the buses at lower prices. Gas station attendants also serve as utility drivers to provide emergency transportation home for members who work at the nearby plant. Between runs, busdrivers work at the station.

An oil company has agreed to allow the cooperative to manage additional gas stations. Candidates for station managers selected by the Brotherhood attend the oil company's training school. Two are currently enrolled.

The Brotherhood's main depot in Detroit has the tools, testing equipment, and machinery necessary to perform all maintenance and repair services on the fleet, including painting.

The Brotherhood has been able to expand its fleet of buses by negotiating a unique arrangement with several small churches in the Detroit area. McAfee noticed that a number of churches owned one or two old buses that were used primarily to transport members of the congregation to and from Sunday services. Most of the week the buses stood idle, but it required a considerable outlay of church funds to keep them in running order.

The Brotherhood repairs and maintains the buses without charge in exchange for the right to use them when they are not needed for church activities. The Brotherhood also supplies the churches with additional buses when they are needed for special occasions.

The Brotherhood's fleet now consists of 11 buses, plus the church vehicles that are available as a reserve during the week. Over 500 people ride the buses regularly, and the Brotherhood also operates a charter service for school groups and other local organizations for outings and travel to other cities.

McAfee says more buses could be put to use if the cooperative had the funds to obtain them. But monthly dues and weekly fares barely cover operating costs —gas, bus maintenance, driver salaries, and repayment of the loan.

"We've asked a number of foundations and civic organizations for help, but nothing has happened yet," says McAfee. "We've encountered a lot of problems, both financial and others, and have solved many of them. None of us have had experience in operating a bus service until now."

Financial and other problems notwithstanding, McAfee is making plans to improve and expand the Brotherhood's operations. "This is only the beginning," he declares. □

Moderator: Mr. E. C. Wood, Stanford Research Institute

Subject: What are the potential impacts on transit operations and service if UMTA funds demonstration programs in which non-conventional carriers are involved?

Definition: An unconventional carrier is one that is exempt from one or more of the following:

- a certified common carrier
- employing non-passenger drivers
- subject to regulation as to vehicles, operator licensing, fares and routes
- subject to union work rules and prevailing wage rates

Underlying issues:

1. Would the development of such carriers impair the economic health of the mass transit industry by limiting its area of service, growth, or depriving it of patronage? Generally no

2. Would the flourishing of such small, specialized carriers result in an insuperable service coordination problem, producing unacceptable voids in service and economic inefficiencies? no

3. What changes in organization, structure and mission of regulatory agencies would such a development make necessary? yes, cheaper

4. What are the implications for public safety? minor

5. What is the impact on organized labor? Eventually be opposed — would increase antagonism to

MASS TRANSPORTATION DEMONSTRATION PROJECT
(PROJECT DATE)
DIRECT ACCESS TO EMPLOYMENT

Exhibit I - General Discriptions

A. Problems

1. The present Atlanta transit system is based on funneling people through the central business area. This system provides only for travel in-to and out-of the Central Business District, which is designed to serve suburban residents and central city business transportational needs.

The needs for direct transportation to resources of greater employment opportunities and community activities is not met by the present transit system design. This system of operation has attributed to the following:

a. The lack of mobility of low-socio-economic residents to industrial complexes located on the city's perimeter.

b. Commuter patterns which limit employment opportunities of low-socio-economic residents.

c. Travel burdens in terms of time, which influences unemployment.

d. Ineffective transportation in deprived communities, because of inadequate direct and cross-town routes.

e. Sterotype employment.

f. The reduced mobility of deprived residents within their own community.

g. The cause of unrest in these communities.

B. Project Objective

The immediate objective of this project is to make accessible job opportunities in perimeter industrial complexes more accessible to low-income residents through subsidized transportation.

TOMORROW'S MANPOWER NEEDS

WASHINGTON -- About three and one-half million job openings will arise annually through the mid-1970's because of employment growth and the withdrawal of older workers from jobs, the Labor Department's Bureau of Labor Statistics has reported.

Employment opportunities will open not only in growth occupations but even in many occupations that are declining or are considered "obsolete," the Bureau pointed out in releasing data on annual training needs for workers in 240 occupations that account for two-thirds of the total annual job openings.

For example, there will be job openings for 600 blacksmiths each year, despite all the "horseless carriages" on the highways. In an occupation heavily hit by automation, telephone operators, there will be 28,000 openings annually, the Bureau estimates.

These findings are based on information in "Tomorrow's Manpower Needs," a 4-volume study just released by the Bureau of Labor Statistics.

"Recent legislation, including the 1968 amendments to the Manpower Development and Training Act, emphasizes the need for information about occupational requirements and job opportunities," Commissioner of Labor Statistics Geoffrey H. Moore said in releasing the report. "Such information is essential in planning education and training programs to meet future needs and for the guidance of young people in choosing careers."

Tomorrow's Manpower Needs provides State and local manpower analysts with the information they need to develop local manpower projections within the context of nationwide economic and technological developments. The report presents the latest projections of national manpower requirements and provides information on techniques for using these data to develop State and area

(MORE)

manpower projections. As background information and tools for the appraisal of manpower requirements at the local level, the report also presents the results of research on the growth and changing composition of the population and labor force, the relative growth of industries, the effect of automation and other technological changes and economic factors on industry employment, the occupational structure of industries, patterns of working life, and techniques for appraising the supply of workers having various skills.

This study includes the most comprehensive information on national manpower estimates and projections ever published by the Department of Labor.

The Department of Labor will give technical assistance and will aid State agencies in checking the consistency of their projections with those for other States and with nationwide trends, with the aim of developing a systematic and continuous appraisal of manpower training needs, as required by the Manpower Development and Training Act. Estimates of annual training needs can also be used by national training and education agencies, education and training officials in industry, and apprenticeship councils to assess the adequacy of current programs in the light of total national needs.

Strife or Legislation: Oct 8, 1966 Farm Labor. AFL-CIO NEWS

Farm Workers' Future Linked To Coverage Under Labor Law

FARM WORKERS have proved they want and can build unions, but without legal safeguards, the process is slow, expensive and disruptive, the AFL-CIO's chief organizer has declared.

William L. Kircher, director of the federation's Dept. of Organization, said the AFL-CIO victory on the big DiGiorgio grape farm in California has shown "the whole farm labor community that collective bargaining can be accomplished." Without the protection of law that other workers have, he said, "it is going to take a lot more time; it is going to take a lot more money; and it is going to cause a lot more bitterness."

He called for expansion of the National Labor Relations Act to include farm workers, warning "there are no two ways about it—without legislation, strikes and boycotts, and struggles and strife become necessary, inextricable parts of developing a union." Kircher's statements came during the network radio interview, Labor News Conference, aired weekly over the Mutual Broadcasting System.

He said that the growth potential of the United Farm Workers Organizing Committee, recently chartered by the AFL-CIO, can "reasonably be set as high as 750,000 to 1 million" members. But the growth, he said, hinges on the "extent to which the federal government and Congress see fit to extend the Labor Relations Act to farm workers and give them some kind of protection and some kind of machinery to organize themselves."

KIRCHER DENIED claims that unionization of farm workers will increase food prices. He said economic experts agree that farm labor is such a small part of food costs that meeting "their economic problems with improved wages and realistic conditions and benefits would have a very small effect on the price of vegetables and fruit."

"But even if it did, the more important question that we have to ask ourselves is if we want the farm worker to subsidize the vegetables and the fruit that go on our tables by working at poverty levels—at substandard wages—and under conditions that we should all be ashamed of," he asserted.

Reporters questioning Kircher were William Eaton of the Chicago Daily News and Sam Sharkey of the Newhouse Newspapers.

Return to EV

BLACKS AND THE DEPARTMENT OF AGRICULTURE

by Don F. Hadwiger
Professor of Political Science
Iowa State University

The U. S. Department of Agriculture has received many verbal tributes that were more than perfunctory, especially from its employees with lively intellectual interests. Gove Hambidge, former editor of the Year Book of Agriculture, viewed the USDA as an idyllic workplace in the 1920's, at which a group of distinguished plant scientists could lean back around an old kitchen table with a coffee pot on it, talk philosophy and anthropology, and sprinkle in anecdotes from their adventures in searching out useful plant varieties around the world. Hambidge quoted a USDA Law scholar during the late New Deal period who felt there was more freedom and more vital work to be found in the USDA than in any University. A USDA historian told Hambidge at that time, "I haven't found an atmosphere I liked so well anywhere, or more satisfying work, or a more interesting lot of people to work with." Hambidge said of his own situation: "I expected to stay . . . for a year at most. Now I shall probably not leave it until I'm retired for decrepitude. For the work . . . has got its hooks into me."*

*Gove Hambidge, The Prime of Life (Garden City, New York: Doubleday, Doran and Company, Inc., 1942), pp. 89-91.

The Department has also been a sturdy home for the leaders of unprthodox bent--the hearty missionaries of the gospel of preserving natural resources, the serious advocates of scientific excellence, the advocates of grass roots democracy, and the social experimenters. One gathers from Arthur Schlesinger, Jr., that the Department of Agriculture during the early New Deal was frenetic with energy, innovation, and sparkling leaders.* Other fine attributes had been present in the Department's early development, according to Leonard White's history of the Republican era from

*Arthur M. Schlesinger, Jr., The Age of Roosevelt: The Coming of the New Deal (Cambridge, Mass: Houghton Mifflin Company, 1958), chapters 2-5.

1869-1901.* White reached the following conclusion about the Department of Agriculture during that time:

> In a period when laxness and indifferent standards were common, the record of Agriculture stood out in bold relief as a gratifying symbol of potential achievements in administration and in service to the American people.**

---

*Leonard D. White, The Republican Era: 1869-1901(New York: The Macmillan Company, 1958, ch. 11.

**Ibid., p. 256

Even "unfavorable" publicity about the USDA was not always unfavorable from every point of view, as when Henry Wallace, the USDA's Secretary and President Roosevelt's choice for Vice-President in 1940, proved to be almost too mystical, too philosophical, indeed almost too much for the Democratic Convention to swallow. Wallace's controversial image coincided with that of the Department, which was bouncing along in the main currents of social innovation, techniological development, and cultivation of new attitudes and beliefs during the period before World War II.

What I wish to do in this paper is to n ote several of the elements contributing to the greatness of the prewar Department, and to suggest that in the period after World War II Black Americans in particular have contributed much to the Department with little or no encouragement from within the Department, and could have contributed more, had the Department been as receptive to the elements of greatness as it once was. I think there is surely an underlying assumption in this paper that the postwar Department hasx not opted for the role of leadership that it earlier chose to provide in the area of domestic social policy. It has been less eager to be in the middle of the stream although it has nevertheless been obliged to swim there frequently. I will not concentrate on explaining why the Department "lost its nerve", so to speak, but rather will suggest that some of the resources it chose not to organize were held by Black Americans. Black Americans, even without invitation, did much for the Department and for themselves, but not nearly as much as could have been done if the Department had been inclined

toward an aggressive Rather than a stand-pat role with respect to the great social issues of the postwar period.

The success or greatness of the earlier Department had to do with its capacity to become identified with the achievement of great national goals-- goals such as the advance of science, conservation of natural resources, preservation of the family farm, vocational education, and the elimination of poverty. This identification occurred when the Department became involved in describing a problem and bringing wide attention to it and in developing and being willing to organize strategies for solving it. This process required leaders with great talent but who also had extraordinary personal commitment to the goal, and it also required political support, initially provided by the Administration and subsequently by the organization of a supporting constituency from among those benefiting most directly from the policy.

The theme of this paper is that Black Americans had much to contribute toward two great postwar goals which came within the Department's field of interest. These goals, as they came to be expressed, were to improve the situation of the rural poor, and to eliminate hunger and malnutrition among all the poor. Committed and talented Black leaders appeared, who along with a number of White leaders communicated these problems to a wider public, and revealed shortcomings in existing USDA policies. These Black leaders did not move into the Department to develop and implement new policy. Still the political forces they linked to generated did contribute to major program reforms. These reformed programs created a large constituency of those served, including many Blacks, which has yet to be utilized to support and guide programs in the manner that previous USDA constituencies were used.

The USDA's reluctance to take leadership in pursuing these domestic goals, its unwillingness to co-opt the committed leaders and to accept support and control from those served, has been a source of embarrassment to the Department, and more important, has left the programs in a paternalistic framework which may have been characteristic of welfare programs generally but was uncharacteristic

of other major USDA programs. We may begin with a discussion of the problems, and the contribution of Blacks in exposing them.

The Situation Posed

The American political system has been quite insensitive to some kinds of situations, including the situation of the poor in America, and the impact of federal policies that are supposed to serve the poor. This is particularly true of policies for the rural poor, because these have become entangled with policies for commercial agriculture. Agriculture policy generally has been uninteresting and seemingly complex, and therefore has been left to a few insiders, except in the few cases in which some dramatic event, or a series of them, has engaged the concern of a wider public. To illustrate such a case, Hugh Hammond Bennett presumably won congressional approval for a comprehensive approach to soil conservation by arranging to have his testimony interrupted by a frightening dust storm over Washington, D. C.*

*Wellington Brink, Big Hugh, The Father of Soil Conservation (N. Y.: The Macmillan Company, 1950, pp. 3-7)

Groups of people can serve as dust storms too, such as the Okies and the Blacks, whther or not this is the function that was intended for them. Extraordinary, sometimes cataclysmic, human tragedy has sometimes punctured the curtain of obscurity erected by an inner circle of policy-makers. The condition of American Blacks has become particularly visible--in some respects more visible than others of similar socio-economic status, and so Blacks have been the basis for a rough sedimentation test of the effects of federal programs in rural America, a test important at least for its dramatic impact. As a subgroup within the poverty class, Blacks have usually been the worst off, and their plight has dramatized that of others.

Observation of the living conditions and appearance of Blacks in the South has aroused the sentiments of distinguished visitors, including Henry A. Wallace, who was prompted to say, after his Southern tour of 1937,

> I have never seen among the peasantry of Europe poverty so abject as that which exists in this favorable cotton year in the great cotton states from Arkansas to the East Coast . . . *

*Gladys L. Baker, Wayne D. Rasmussen, Vivian Wiser, Jane M. Porter, Century of Service: The First One Hundred Years of the U. S. Department of Agriculture (Washington: Government Printing Office, 1963), p. 204

In 1967, a poignant encounter between a few U. S. Senators and some starving babies in Mississippi brought the following whispered comment from Senator Robert Kennedy: "I've seen bad things in West Virginia, but I've never seen anything like this anywhere in the United States."*

Nick Kotz, Let Them Eat Promises: The Politics of Hunger in America (Englewood Cliffs, New Jersey: Prentice-Hall, I c.), pp. 1-3.

Blacks have given poignancy also to the statistics on the conditions of life in rural America. Recent USDA surveys of Southern poverty areas indicated that a majority of Black heads of households were partly or completely disabled,* and this striking fact may have obtained greater visibility for findings in a parallel study of the Ozarks** which indicated that one-fourth of the White heads of households there were also partly or completely disabled.

*

**Human Resources in the Ozarks Region. . . with Emphasis on the Poor, U. S. Department of Agriculture - Economic Research Service in cooperation with the Universities of Arkansas and Missouri Agricultural Experiment Stations, Agricultural Economic Report No. 182, p. iv.

Blacks have also illustrated the failures of agricultural subsidy programs, again because they were at the economic bottom. They were tenants, usually, rather than owners, small farmers rather than large farmers, the lower caste, the most marginal of all farmers. Federal assistance to rural America has been channeled through programs designed to control production of certain commodities and to subsidize the income of the producers of these commodities. These programs gave little or no help to poor farmers--this was illustrated at the time these programs were first passed in the 1930's, when many landlords pushed the Blacks off the

unused lands in order to keep for themselves the entire federal subsidy.* The evicted families were obliged to camp along the roadsides, and their plight was reported in the New York Times.** The Administration responded with token steps to protect tenants, but conflict within the USDA over proposals for more adequate protection finally precipitated the dismissal of several liberal USDA officials, perhaps signaling a trend toward giving Southern conservatives their way with respect to these Departmental programs.***

*Fred A. Shannon, American Farmers Movements (Princeton: D. Van Nostrand and Company, Inc., 1957), p. 94. See also David Eugene Conrad, The Forgotten Farmers: The Story of the Sharecroppers in the New Deal (Urbana: The University of Illinois Press, 1965).

**Ibid., pp. 182-186

***Schlesinger, op. cit., p.

In that case, as in some others, dramatic illustration produced widespread knowledge of the policy inadequacies, but no adequate remedy. In the years which followed policy-makers were able to ignore the increasingly inequitable distribution of farm program benefits which resulted from the fact that benefits were apportioned on the basis of the amount each farmer produced. Even the rural liberals confused themselves and others by justifying production subsidies as equity measures, as economist Kenneth Boulding once pointed out . Boulding noted,

> Agricultural policy has been sold under the name of justice on the basis of a wholly fallacious syllogism. The major presmise is, 'We ought to help the poor.' . . . The minor premise is that farmers are poor. . . The difficulty here is in the minor premise. Some farmers are poor and some farmers are filthy rich. When you help farmers you tend to help the rich more than the poor. . .*

*Kenneth E. Boulding, "Agricultural Organizations and Policies: A personal Evaluation," in Farm Goals in Conflict: Family Farm, Income, Freedom, Security (Ames: Iowa State University Press, 1963), pp. 159-160.

Scholars have long been at pains to point out that subsidies geared to productivity provided littlehelp to small operators. Economists at Iowa State did so in the 1930's.* Economist Clay Cochran stressed in 1950 that 38% of the agricultural

*Charles M. Hardin, Food and Fiber in the Nation's Politics, Vol. III of the Technical Papers for the National Advisory Commission on Food and Fiber (Washington: Government Printing Office, August 1967), p. 18.

population, living on the smallest units, produced only 5% of the agricultural product, and thus received few federal benefits. Cochran added, with some feeling,

> No serious inroads have been made into the poverty of the lower one-half in agriculture, and millions of farmers, farm laborers and their families still live in grinding misery and poverty, and the babies of the migratory workers are still dying of malnutrition in the richest agricultural areas of the country.*

More recently it has been hypothesized that farm subsidies actually passed into higher land values rather than into higher farm income, thus benefiting owners as against tenants. Economist Mason Gaffney wrote:

> The proximate beneficiary of most farm programs is the landowners, per se. Farmers who are not landowners, like the migrant harvesters who get down to 25 cents an hour in some places, do not gain, but suffer from lower demand for their services. Land owners who are not farmers, such as the matinee idols, senators, industrial executives and country bankers who sink their spare change in rural real estate, benefit hugely.**

---

*Clay L. Cochran, "Price Supports and the Distribution of Agricultural Income," The Southern Economic Journal, Volume XVII (January 1951), pp. 331,333.

**Mason Gaffney, "The Benefits of Farm Programs: Incidence, Shifting, and Dissipation," Journal of Farm Economics, volume 47 (Dec. 1965), p. 1252.

Social scientists were most likely to be aware of the discriminatory effects of farm programs, and those who wished to urge reforms proceeded in various ways. Some joined forces with conservatives who wanted to phase out farm programs on the grounds that they were an unnecessary interference with the market economy; but this appeal to conservative interests, led most prominently by Secretary of AGriculture Ezra Benson, did not succeed in phasing out the farm program, nor did it make them more equitable. One approach was that of Professor Theodore Schultz, who devoted himself for years, without very noticeable impact, to the task of analyzing the effects of farm programs, and suggesting reforms that would frankly achieve welfare goals rather than production control. Schultz repeatedly criticized --

> the practice of mixing production and welfare into a policy brew so spiced that no one could distinguish one ingredient from another. This mixing of policy objectives has led to much confusion and waste; all too often, as a result, particular farm programs have improved neither production nor welfare. These errors have led to a serious neglect of the welfare of farm people, and it is no wonder that farm people have fallen behind the non-farm population in education, nutrition, housing, modern medical facilities, free time, old age and disability benefits, and other phases of social security.*

---

*Theodore W. Schultz, "Production and Welfare Objectives for American Agriculture," Journal of Farm Economics, vol. XXVIII (May 1946), p. 451.

Another leading economist, Professor Walter Wilcox, preferred to continue the commodity programs because of their contribution to a stable commercial farm economy, but he expected commercial farm leaders in return to accept the moral obligation to provide special programs for low income citizens, the "other half" of rural America. In his book, Social Responsibility in Farm Leadership, Wilcox seemed actually optimistic in 1956 that commercial farm organizations would support programs for low-income citizens. He said -

> Thus far . . . the general farm organizations made up of family farmers have given relatively little special attention to this persistent problem. The Farmers Union has been most active, particularly in the working for an expanded supervised credit program for these families . . .
>
> All three general farm organizations in their policy statements for 1955 indicated that they are now concerned about these problems of low-income farm families and will support programs for dealing with them in the future. Since the farm organizations are primarily concerned with the interests of their members, however, the ethically sensitive farm leaders have the special responsibility of keeping the members informed of and interested in the solution of these problems, which have been regarded as outside of their ordinary concern.*

---

*Walter W. Wilcox, Social Responsibility in Farm Leadership (New York: Harper and Brothers, 1956), pp. 171-172.

Wilcox hopes were unfulfilled, as Farmers Union subsequently joined with other organizations that were largely indifferent to the plight of "the people left behind." Even a new farmer protest organization, The National Farmers Organization, turned out to be only another set of commercial farm leaders with another strategy to serve the medium and large commercial farmers.

In addition to farm organizations, another locus of farmer political power was the congressional agriculture committees, but no one expected reform from that quarter. During the New Deal and since, issues relating to poverty in the South and other rural areas were usually controlled by Southerners in whose constituencies the economic class conflict was clearest cut. A minority of Southerners favored measures such as the 1949 Brannan Plan designed to achieve a more equitable spread of farm program benefits, but most of them came down hard on proposals which might enhance the status of tenants, Blacks, and the poorer classes generally.

Existing farm programs were also supported by farmer voters everywhere, and attacks upon them by Secretary Benson proved costly to the Eisenhower Administration.

Therefore, the Freeman Administration did not hesitate to support these programs. Freeman favored additional programs to serve the poor, but achieved relatively little change. The political climate in agriculture seemed so hostile to welfare or equity goals that Freeman's Under-Secretary, John Schnittker, urged that the Department honestly acknowledge that its farm programs did not serve the rural poor as a first step toward permitting other agencies to assume full responsibility for that group. Schnittker said in 1965 --

> Farm policy needs to be primarily commercial farm policy. Price-support levels, production incentives, and income objectives must be geared to this central fact.
>
> This in no way diminishes the importance of public and private efforts to speed rural development and reduce rural poverty. Other programs--some of which are administered by the Department of Agriculture but primarily programs which are the responsibility of other departments--must provide the jobs, the education, and the opportunities so essential to better lives for those persons in rural America not on adequate-sized farms. Farm policy can help but it cannot do the job for these people.*

*John A. Schnittker, "Farm Policy--Today's Direction," Journal of Farm Economics, vol. 48 (Dec. 1966), pp. 1093-1094.

Freeman, however, was not ready to relinquish the argument that farm commodity programs were of substantial assistance to poor farmers. During the Poor People's Campaign of 1968 he told Rev. Ralph Abernathy, "When the farmer loses it is the poor, small farmer who suffers most.*

*Letter from Freeman to Rev. Ralph Abernathy, May 23, 1968 (USDA history files).

Thus there was no effective voice within the rural establishment in behalf of those discriminated against by farm programs. In attempting to explain this, John Brewster suggested that the technological revolution in agriculture, while displacing most farmers, did not bring about a social revolution in its wake. Brewster said --

> Technological advance in agriculture thus has the singular distinction of being mechanically progressive but socially conservative. It creates no new occupational class of people whose new ways of living and of making a living force them to reweigh America's pre-machine creeds of life in light of their new needs of livelihood and sense of status deserts. Farm people may be experiencing painful conflicts among their older creeds, but the point here is that the

generator of such conflicts lies outside their own rapid technological advance.*

*John M. Brewster, "Society Values and Goals in Respect to Agriculture," in Goals and Values in Agricultural Policy (Ames, Iowa: Iowa State University Press, 1961), p. 126.

There was no new occupational class bristling with self-confidence and power. A large segment of the agricultural workforce had been plucked off, but this segment lacked class consciousness and was tending toward retirement or migration to the towns and cities.

Given the fact that the rural poor lacked visibility and class consciousness, the emerging visibility and solidarity of Blacks as an ethnic group has tended to project a compensatory image, and to provide some leadership for the rural poor. The condition of Blacks who remained in agriculture was illustrated in newspaper stories, for example, which contrasted the wealth of Senator James Eastland with the poverty of Negroes resident on his property, and this condition also could be illustrated by analyses showing that virtually all Negro farmers fell into the class of farmers that received little benefit from farm programs.*

*Of 868,908 farmers with sales of $10,000 or more, only 7,036 were non-white operators living in the South, according to the U. S. Department of Commerce, Bureau of the Census, 1964 U. S. Census of Agriculture, Vol. II, ch. 6, Table 25; and Ch. 8, Table 26.

Further light on inequitable distribution of farm program benefits was shed by investigations of race discrimination in farm programs, findings which had a way of proving discrimination by economic class.* The relationship between poverty and race could be used to help all of those in poverty as it had previously been used by some Southern leaders to divide and conquer the poor.**

*See particularly Cycle to Nowhere (Washington: U. S. Government printing office, 1969).

**Fred Shannon, op. cit., p. 94.

For example, it was noticed that there were only one or two Negroes among those thousands of county committeemen who administered farm programs locally, a finding which created the suspicion that farmer committees contained few low-income representatives from any race.*

*Robert J. Morgan, Governing Soil Conservation: Thirty Years of the New Decentralization (Baltimore: The Johns Hopkins Press, 1965), p. 319.

As another example, when equal protection guarantees were made applicable to USDA loans for recreational development, the first major violation of the guarantees was proved, to the apparent satisfaction of all parties, by the fact that the three Negroes who had been listed as members of the organization which received the loan were all too poor to pay the dues.* Mississippi hearings by the Civil Rights Commission in February 1967 first exposed the fact that the food stamp program was generally not reaching the poorest and hungriest citizens.**

*Washington Post,

**U. S. Congress, Senate, Committee on Labor and Public Welfare, subcommittee on Employment, Manpower, and Poverty, Poverty, Hunger, and Federal Food Program Background Information, 90th Congress, 1st Sess., 1967, pp. 88-91.

Blacks as a class have consciously taken part in communicating the existence of poverty. The most notable effort was the Poor People's Campaign of 1968 in which Blacks were leaders and chief participants. The campaign was less than fully successful, partly because most Administration officials, including Secretary of Agriculture Freeman, took a defensive stance which ruled out meaningful communication. Yet the Poor People's Campaign did thrust poor people onto the front pages over a period of weeks, and its focus on hunger helped make this a salient national issue. Partly as a result of this campaign, whose Black leaders included Rev. Ralph Abernathy, Hosea Williams, Sterling Tucker, Jesse Jackson, Andrew Young, and others, the primary objective of food programs was changed from that of facilitating disposal of farm program surpluses to that of alleviating hunger among the poor in America. Major if not thoroughgoing reforms then followed in both the food stamp and the school lunch programs.

Black leaders had contributed in other ways to program reforms. A study directed by Mrs. Jean Fairfax made the nation aware that school lunch programs generally did not reach lower income children. Another Black lawyer, Miss Marian Wright,

drew the attention of Senator Robert Kennedy and other influential policy-makers to conditions in rural Mississippi, and followed through with other large steps toward removing the cloak of indifference towqrd hunger and misery in the United States. Black leaders were prominent and often preeminent in the important steps which produced a national consensus in support of ending hunger in the United States. It is interesting that these Black leaders and also the White leaders who built this national consensus did not enter the Executive Branch to implement it, under either the Johnson or the Nixon Administrations. Leaving the committed leaders outside was a departure from the way in which the USDA had met previous challenges.

Great Objectives and Committed Leadership

There was a common pattern in many of the great achievements by the Department of Agriculture. Each was the work of a large agency which grew up under a leader committed to a great objective. This leader was given a relatively free hand by the Secretary of Agriculture and he could depend upon the support of the Administration.

We should emphasize the typically close relationship between objectives supported by a large consensus and leaders committed to achieving that objective. A great objective became that only after a leader had created broad awareness of a problem, had conceived bold solutions, and had mobilized the resources to implement that solution. In that process, there were interests to be contested and to be overcome which worked through the Congress, through jealous bureaucracies, and through other power centers at all levels. The committed leader tended to be a visionaary person with technical competence and some political skill, who was also hard-headed, whose first task was to obtain presidential support, or at least the support of the Secretary of agriculture. The Secretary, who was not so free to enter controversy or to become engrossed in a single task, provided substantial support for as long as possible. A conflict might eventually grow up between the ADministration's desire to

reconcile the opposition, and the task leader's desire to see the task through regardless of the political cost. As Administration support began to flag, the successful leader relied upon satisfied constituents to provide continuing support for the agency.

There were variations on this pattern, as in the case of the farm program agency, which owed its success to not just one committed man but to a succession of leaders, including some drawn from its constituency. Several objectives which were developed by committed leadership from within the Department included soil conservation, preservation of forests and public lands, stabilization of farm production and income, and education of the farmer. These objectives, in their fulfillment, were associated with distinguished leadership. Indeed the history of the Department sparkles with dedicated leaders,* a few of whom should be cited by way of illustration.

*See Century of Service: The First One Hundred Years of the United States Department of Agriculture (Washington: U. S. Government Printing Office, 1963)

Gifford Pinchot gained the support of President Theodore Roosevelt for programs to conserve forests and other natural resources, programs which seemed impossibly bold in that rapacious age. Pinchot spent years at the tasks of winning national support and implementing his programs. He accomplished these tasks while in the role of civil servant, as head of the Forest Service in the Department of Agriculture. Under his guidance, the Forest Service became a model of excellence and high commitment, and not without enduring enormous opposition from spoilsmen and regional interests.*

*William Henry Harbaugh, The Life and Times of Theodore Roosevelt (N.Y.:Collier, 1961, pp. 313-319.

Seaman Knapp was also radical, in his way, and strong-willed, and is now regarded as a man of vision and dedication. Knapp's interest was in education, and he believed that the ignorance of the masses, particularly of farmers, was attributable to an ~~unresponsive~~ unimaginative educational system rather than to a hopelessly apathetic people. He developed the demonstration technique for communicating knowledge to dirt farmers, and then he insisted upon demonstrations in every farm neighborhood and even

in every household. Knapp's sustaining sense of mission was found in all of his statements, witness the following statement made to Georgia demonstration agents in 1910:

> But you are beginning at the bottom to influence the masses of mankind, and ultimately those masses always control the destinies of a country. If you allow their practices to sink lower and lower the country must ultimately drop to a lower level in its moral, political and religious tone, and we go down into degradation and infamy as a nation; but if we begin at the bottom and plant human action upon the rock of high principles, with right cultivation of the soil, right living for the common people, and comforts evewrywhere, and make wealth and prosperity all through the rural districts, the people will lend their support and all civilization will rise higher and higher, and we shall climb to the summit of human excellence and become a beacon light to all nations of the world. I do not glory in the wealth of a few, but rejoice in the general distribution of wealth and prosperity for the common people.*

*O. B. Martin, The Demonstration Work: Dr. Seaman A. Knapp's Contribution to Civilization (Boston: The Stratford Co., 1921),262

Hugh Hammond Bennett created the USDA's Soil Conservation Service. According to a Departmental history,

> Hugh Bennett saw soil erosion as a crime against nature and posterity. He issued repeated warnings that nations had disappeared from the face of the earth as a result of soil erosion. He estimated, in 1935, that approximately 125 million acres of land had lost all or the greater part of their irreplaceable top soil and that erosion was getting actively underway on another 100 million acres. The situation called for more than research. It called for action on a national scale.*

But action meant persuading millions of apathetic landowners, and equally difficult, countering the tendencies within the government towards token and single-faceted approaches. Bennett brought together an energetic group, and insisted on ever higher quotas of achievement, until in 1950 he projected realization of his objective based on progress during the prior 15 years. He said, "It is my belief, given adequate facilities, that we can get the job of applying the basic conservation measures to the land completed by 1970. . . "** Bennett, like Pinchot, proved that a dedicated civil servant can help to establish and to achieve a great national objective.

*Century of Service, op. cit., pp. 190-191.

**Wellington Brink, Big Hugh, the Father of Soil Conservation (New York: The Macmillan Company, 1951), p. 119

These controversial leaders were not easy to absorb, even in a Department accustomed to vigorous men, but the Department might have been even more uncomfortable had it forced Bennett into the less productive role of Departmental critic.

Rexford Tugwell was a leader with unorthodox background and unorthodox ideas who originated the Department's major program for the poor, which was first called the Resettlement Administration and subsequently called the Farm Security Administration. The programs ran into heavy criticism from within the Department and especially from the congressional committees. Tugwell assumed that it was hostility toward himself as an "outsider" that was the basis for much of the opposition, and he therefore resigned after three years in the hope, as he said, that "the removal of so controversial a figure . . . would perhaps soften the hearts of the legislators."* The agency nevertheless came to an early end. The cases above indicate that committed leaders were quite likely to be a necessary part of an agency's birth and development, more so than the cause of its death.

*Century of Service, op. cit., p. 250.

The above pattern of development, by committed leaders under a Secretary's umbrella, was not the pattern followed with respect to the development of the domestic food programs, or for that matter with respect to lesser initiatives on domestic policy in recent years. Instead the major steps toward adequate food programs were instigated by committed leaders outside the department. These steps, particularly with respect to the food stamp program, included the development of a supportive consensus in the nation and in the Congress, effectively changing the objective of the program from that of surplus disposal to that of meeting human needs, extending the program geographically, changing the terms of participation so that the poor could meet them, providing adequate and substantial benefits, and of course securing adequate funding for the program.

The reluctance of the USDA to take each of these steps, as chronicled by Nick Kotz, did not mean that there was a lack of support within the Department for the food stamp program. Indeed Secretary Freeman lobbied enthusiastically for the initial program, which was designed primarily for farm program rather than for welfare objectives. After Freeman learned about the program's shortcomings, usually

from his critics, he maintained a defensive posture but nevertheless implemented some improvements. During the Poor People's Campaign he decided to request funds for a more nearly adequate program, and was denied them by the President, so that President Johnson's priorities, rather than Freeman's, ultimately prevent the expeditious development of an adequate food stamp program.

Secretary of Agriculture Clifford Hardin entered office committed to develop an adequate food stamp program. Like Freeman, he felt himself to be under pressure from an informed public to accomplish this goal quickly. He did not follow President Nixon's initial suggestion that the needed funds be extracted from elsewhere in the USDA budget, but his dilemma was ended when President Nixon, and also congressional liberals secured a large increase in appropriations for food stamps, which Hardin quickly put to use; and the program became defensible as a welfare measure.

The USDA's behavior on the hunger issue might have been different under the influence of a committed leader. Such a leader might have changed the USDA's view ~~that~~ domestic malnutrition ~~was not a serious problem, and in any case was not quickly remediable by income subsidies. He might~~ have exchanged this view for ~~the one~~ subsequently adopted by the White House Conference on Food, Nutrition, and Health namely that there were many steps including income subsidies that the nation could and should immediately do to alleviate domestic hunger.* Meanwhile, the leader would have made himself and his agency a rallying point, through efforts to intensify public and congressional support, and having done ~~that~~ so he would have been assured that decisions relative to his agency and program could be referred beyond the micropolitical system which usually decided farm policy questions. Then also food programs would have standing within that system other than as a hostage to secure urban votes on agriculture policies. Obviously the willingness to risk a confrontation with the committees might have become a complicated and exhausting game, and it could have proven costly to the Administration, just as Pinchot's initiatives were thought to have cost President Roosevelt the Western states.*

*White House Conference on Food, Nutrition and Health, Final Report (GPO, 1969)

*William Henry Harbaugh, op, cit., pp. 313-319.

On the other hand, a successful effort to turn a national consensus into a national policy might have loosed the Department's hand to deal with other looming national issues, especially environmental issues such as control of soil and chemical pollution, and regulation ofagricultural chemicals.

It must be noted that confrontation within the system could not precede the development of public attention to the issue, and in the absence of prior concern about housing, the USDA's Farmers Home Administration ~~Confrontation, on the crest of a consensus on the hunger issue, was less likely to be successful on other less visible issues. The problem of poor housing, for example, did not become a matter of great public concern, but it could be argued that the USDA nevertheless did have committed leaders who worked within the microsystem of agriculture. The agency in this case was the Farmers Home Administration, which makes subsidized loans to rural residents, including housing loans.~~ Secretary Freeman's FHA Administrator, Howard Bertsch, with strong support from his superiors in the USDA's top echelon, exercised vigorous leadership internally but was careful in his relationships with the congressional agriculture committees, even to the point of being willing to make recreation loans to segregated country clubs. The agriculture committees did accede to many of Bertsch's requests although FHA's expanded housing authority came mostly from the congressional banking committees. Impressive increases in the number of low and moderate income housing loans, a considerable proportion of which were made to Negroes, continued into the administration of James V. Smith, with vigorous leadership being exerted also by Joseph Haspray and other top civil servants in FHA. However, Farmers Home will probably not be able to claim a large role in having defined the problem of poor housing or in having brought it to national attention. The agency may have developed comparatively good relations with its constituents, thanks to an attractive product and a sympathetic field staff, although it seems far from having created a supportive constituency such as other major USDA agencies have done.

Constituency

Most agencies have two-way interaction with those they serve--their constituents. Constituents help to guide the agency's programs and work hand in hand with the agency to generate political support for these programs. The political administration reinforces this relationship by using the agency to woo

constituents' support for the President.

A major department presumably has some discretion in choosing its constituents, over time. In picking constituents it may seek a balance of interests such as the mineral users and the conservationists served by the Department of Interior; and in orienting or socializing constituents the agency seeks to make them see their interests within a framework satisfactory to the larger public who are interested observers. To put it another way, the department wants to avoid becoming boxed in by an overjealous and greedy clientele.

The USDA has been unsuccessful in achieving balance, to put it mildly. Although its potential constituencies include all rural citizens and all participants in the agricultural economy, the commercial farmers, who fall into both categories, have gained and maintained great influence over the distribution of benefits. This is one reason why the very large programs for aid to low-income citizens recently given to the USDA have taken on a paternalistic pattern of administration.

These new programs, which were largely a product of leadership initiatives taken outside the USDA, include nutrition education food assistance, and also ~~nutrition education and~~ subsidized credit. The constituency of each will be discussed. In the nutrition education program, administered by the state cooperative extension services and subsidized and coordinated by the USDA, the link to the poor is presumably provided by several thousand nutrition aides, recruited from the poor, a majority of whom are Black. But these aides are neither fish nor fowl, since they are without permanent status as employees and yet lack a mechanism to perform as representatives of those they serve. So this program continues to be governed by commercial farmers and by college-oriented specialists.

The lack of responsiveness to low income constituents, and indifference to their needs, was evident in the administration of the postwar food assistance programs, beginning with the commodity distribution program in the 1950's. Discretion in using these surplus commodities was usually vested with county governments, which often did not use the program at all, or even used surpluses as one means of providing abundant and low-price labor by making food available during slack ~~seasons~~ seasons and then terminating the program or tightening requirements during work seasons.

For more than a decade the Department was stoic in the face of complaints voiced in behalf of recipients that programs were used to manipulate and to degrade them, that many poor people lived in counties that did not have food programs, that eligibility standards were arbitrary, that administration of the program did not serve the interests of recipients. The food stamp program which replaced the commodities was also designed and administered with little consideration as to whether those needing food assistance were getting it, and as to whether assistance was adequate. Indeed, the very low level of participation indicated that the program was either unavailable or unattractive or both.

Local administration of these food assistance programs was carried out, in most cases, by the federally-supported wselfare structure that handled aid to dependent children, old age assistance, and other categorical assistance programs. Experience with the food programs continually indicated that these agencies were no more adequate as a vehicle for distribution of food program benefits than they would have been as intermediaries in farm subsidy programs. Welfare agencies, particularly those in rural areas, were inclined to seek the smallest possible case load, and some were remarkably successful in this goal. In any event the existing welfare clientele was but a fraction of the universe eligible for food stamps, and those others were inclined to fear that to pass through welfare doors would cost them the esteem of others. The welfare offices, which might have used the opportunity to broaden their contacts beyond the welfare constituency and thus to change their image, tended instead to regard the food program as an extra duty to be performed in behalf of the Department of Agriculture.

Low-income credit has been provided through Farmers Home Administration. The local committees that oversee Farmers Home loans are appointed from among non-users, unlike the commercial farm programs that are run locally by elected committees of participating farmers. But one could argue, as Morton Grodzins did based on a study of farm program committees, that these elected committees do more to frustrate equity in distribution than to insure it,* especially in view of the fact that local FHA administrators, who worked mainly with low-income clients, were fairly responsive

to them. Exemplary of the direction given by state and national FHA officials was their effective record of having recruited many Black professionals, a few of whom were promoted to supervisor in charge of a local office. It appears that the presence of Black professionals in local offices was associated with increased local participation by both Black and White clients. In addition, it was decreed that the local FHA committees in predominantly Black counties were required to maintain a majority of Black members.

The question as to what is the proper vehicle for communication between agency and constituency has been a controversial one, especially after the inconclusive experiments under the anti-poverty programs, and perhaps in the last analysis a successful relationship is a product of many years of sincere and pragmatically-selected efforts. But one can point out the unsatisfactory extremes, on one side when the relationship is too close, as in the case of the USDA and commercial farm interests, and on the other side when it is too distant, as in the case of the USDA and food program recipients. The emerging constituency of the poor, in which most active participants have been Black, has apparently not considered it possible to communicate effectively with the USDA. For example, the National Welfare Rights Organization, whose leaders have been mostly Black and whose tactics have been as obstreperous as those of earlier and contemporary farm organizations, has developed local strength in some metropolitan areas, and has successfully exploited Washington forums such as the White House Conference on Food, Nutrition and Health. Although food programs were a major interest of the Welfare Rights Organization, NWRO could not communicate with the USDA as well as it could with the Office of Economic Opportunity and the Department of Health, Education, and Welfare. NWRO and other similar groups, viewing the whole USDA scene, seemed to feel that the USDA was hopelessly enmeshed in what was often referred to as a "colonialist" mentality governing the USDA's relationship with poor constituents.

On the other hand, the USDA's relationship with commercial farmers, as communicated through farm organizations, congressional agriculture committees, and farm congressmen,

has been so close that the USDA has often preferred to suffer embarrassment from outside pressures in the form of legislative imperatives and even charges of incompetence rather than challenge the will of farmer interests. Overresponsiveness to these interests led economist Kenneth Boulding to say that he would like to abolish the Department of Agriculture, and the Departments of Labor and Commerce, too, because ". . . it is absurd to have commodity pressure groups in the executive branch. We have got quite enough of them in the legislature."*

*Kenneth E. Boulding, "Agricultural Organizations and Policies: A Personal Evaluation," in Farm Goals in Conflict (Ames, Iowa: Iowa State University Press, 1963), p. 160.

Boulding suggested that domestic services be reorganized within a Department of Science and Research and a Department of Poverty and Economics. This seems to assume, on the one hand, that a restructuring of agencies will lead to a restructuring of the micropolitical systems which are made up of congressional committees, bureaucracies, and constituencies, and on the other hand, that the micropolitical systems can not restructure their own house, that the Department of Agrficulture can not accept leadership of a vast new constituency made up of low-income citizens who already receive food assistance, housing loans, free lunches, nutrition education, and many other services from the Department.

Conclusion

Of course mobilization of a new constituency would be difficult, even for a Department with a distinguished history of experimentation in administrative democracy. Low-income Americans have been a low status group, and besides that have only begun to organize themselves. And in this case, too, the promise of administrative democracy has carried with it the threat that elites would ariae to bias the distribution of benefits. The chief elite in this case was a Black elite which, in the struggle for civil rights and Black identity, had broken free of community norms which still kept much of the White poor in its place. And Black leaders were obliged to represent those at the bottom of the constituent group if they were to speak for most other Blacks. The Black community has urged norms of solidarity

as a means of counteracting class interests, though these are far from fully effective.

This Black elite has already been of much assistance in providing a new mission and a new constituency for the Department, and in securing adequate resources for that mission. Yet this new constituency, and its leadership, still finds itself on the outside looking in. And a distinguished Department finds itself, as in a bad dream, a Gulliver amidst the surrounding crowd, some of whom are fixed on it with sad and reproving eyes, others having turned away in rejection, while angry forces are pushing it forward, despite itself, in the direction it wants to go. One might say this is no dream but real life, and the Department is behaving as gracefully as possible in circumstances over which it has little control. This deterministic view was not accepted by one distinguished observer of agr icultural politics, Professor Charles Hardin, when he was asked by a Presidential commission in 1966 for advice on the administration of farm policies. Hardin urged program revisions to deliver more benefits to the rural poor, and as a way to do that, he gave the following suggestion which appears not to have been fully heeded. Hardin said:

> . . My purpose is not to praise famous men. Rather, it is to counter any implications of institutional or social determination in what I have written. Dr. Johnson dismissed the argument on free will as follows: "Sir, we know that we are free, and there's an end on't." Famous faculties, renowned colleges of agriculture, effective agencies of government, and the USDA itself as well as Congressional Committees on Agr iculture and the farm organizations in their golden periods have been greatly shaped and guided by individuals who set the tone, defined the standards, and provided the examples. The inference is clear: Men may go on suffering "The stings and arrows of outrageous fortune, or . . . by opposing, end them. . . "*

Farm Labor

THE CONDITION OF FARM WORKERS AND SMALL FARMERS IN 1966

REPORT TO THE BOARD OF DIRECTORS OF NATIONAL SHARECROPPERS FUND

by Fay Bennett, Executive Secretary

> "Some of the [Mississippi] children could not go to school because they had no shoes, and had distended stomachs, chronic sores of the upper lip, and were extremely lethargic – all of which are the tragic evidence of serious malnutrition."
>
> Senate Subcommittee on Employment, Manpower and Poverty, New York Times, 4/30/67

> "It was a simple business proposition [leasing 4,600 acres to the Hammermill Paper Company], Mr. Rogers explained. The rent for putting the land into pulpwood would far exceed the return from the 25 or so [evicted] tenant families . . . ."
>
> Sumter County, Alabama, landowner in the New York Times, 2/11/67

> "My mother . . . has been working in the fields for 40 years . . . . She just came back from Minnesota. Why should she have to do that? My father has cancer, yet he is working in the field. Forty years of migrating to look for food is too long."
>
> Father Gonzales, co-chairman of the Texas farm workers protest march

The Year in Brief

1966 was the year in which the United States discovered it still needed its farmers. Large-scale world food shortages resulted in the reduction of U.S. carry-over stocks from surplus to less than desirable levels. Cotton shortages also appeared abroad; these may affect U.S. surpluses in 1967 as the grain shortage has changed the food picture already. General farm income rose, but consumer costs rose so much more that widespread consumer protest was felt. Although farm wages increased too, and a minimum wage was established, they lagged so far behind general American standards that farm workers across the country undertook protest marches, union organization, and strikes, with first dramatic gains appearing in California. None of these gains was shared by small farmers, whose numbers continued to drop, particularly under forced evictions in the southern states.

The Vanishing Sharecropper

Since 1960, the total number of farm residents in the United States has dropped by 4 million, from 15.6 to 11.6 million people. The rate of decline is about 4 per cent for white and 10 per cent for Negro farm people. In eight southern states the number of Negro farmers – owners, part-owners, and tenants – dropped from 210,591 in the agricultural census of 1959 to 142,506 in the 1964 census. This was a loss of 32.4 per cent. In the same states the number of white farmers dropped 15 per cent in the same period, from 679,692 to 576,394. The exodus of rural Negroes in the sixties can be related directly to the number of mechanical cotton pickers. Alabama had 734 in 1960; 2,490 in 1964. South Carolina had 455 in 1960; 2,048 in 1964. Figures are similar in other states. Mechanization and use of chemicals have started the same process in tobacco production.

The out-migration is related, also, to the persistent difficulty marginal farmers – those who need help most – have in obtaining government assistance. Only 12 per cent of Farmers Home Administration loans in 1966 went to farmers who earned less than $4,000 – and most Negro farmers earn far less. In Hinds County, Mississippi, evictions are related directly to the tenant farmers' attempts to share in federal programs; to their asking for receipts in business dealings; to the election of Negro members of Agricultural Stabilization and Conservation Service committees. Tenant farmers were evicted in Alabama because they would not sign over their ASCS checks to the plantation owners. Some evictions can be attributed to voter registration drives and to fear of the growing Negro vote in the blackbelt counties. Landlord-employer attempts to evade application of the minimum wage have also speeded up evictions and in some cases spurred the shift from cotton to cattle.

Poverty in the South

Most of all, people leave to escape the poverty that is still more prevalent in the South than anywhere else in the nation. The southern states had only 25.9 per cent of the nation's population in the 1960 census, but nearly half its poverty. Yet their share in the federal programs that might relieve that poverty is near the population proportion, and far below the extent of need. For instance, only 31.8 per cent of public assistance payments in the United States in fiscal 1965 were made in the South.

The antipoverty program itself has been urban-oriented, but the rural roots of poverty are beginning to be understood. In fiscal 1966, less than one-seventh of total Community Action Program funds went into rural program development and administration. In Department of Labor programs, only 20 per cent of Manpower Development and Training Act funds went for projects in rural areas. In 1964, the Rural Community Development Service found that only 3.4 per cent of MDTA training projects were conducted in small towns under 10,000 population or their surrounding rural areas, and only 3.1 per cent of the number of trainees who participated were in rural and small-town projects. In fiscal 1966, 164 MDTA agricultural projects were approved for 7,100 trainees, a decrease from previous years. The total budget for the South's 16 Negro agricultural colleges was $32 million in 1962 while that for 4 southern white land-grant colleges, with fewer students, was $72 million.

Hired Farm Workers

More than 3 million persons did some work on farms for cash wages in 1965, the latest year for which full information is available. Of these, about 1.3 million were casual workers, employed for less than 25 days at farm work, and about 1.9 million were noncasual, employed for more than 25 days. In the labor intensive crops, the number of man hours increased – 2 per cent in both the record vegetable crop and in fruit and nut production.

Income. The 1.3 million casual workers averaged only 9 days of work and earned $66.00; although many of them were students and housewives, there is no way of knowing how many were trying to find work over the whole harvest season, and how much their incomes depended on farm work. Over-all, the 1.9 million noncasual workers averaged 137 days and earned $1,045 during the year. Whites averaged 142 days and earned $1,170; nonwhites averaged 125 days and earned $747. About 2 million persons did farm work only; they averaged 104 days' work and earned $805. In 1964, 2.1 million did farm work only; they averaged 100 days' work, and earned $698. A Department of Labor study submitted to Congress in January, 1966, revealed that although in 1947 the median annual income of farm laborers including foremen was 31 per cent of that for craftsmen, foremen, and similar workers in nonfarm industries, in 1964 it had dropped to 21 per cent. In the same period, average hourly earnings in contract construction increased 131 per cent; in retail trade, 108 per cent; in manufacturing, 107 per cent; in wholesale trade, 107 per cent; and in agriculture, only 64 per cent. Yet output per man hour in agriculture in 1964 was 2.7 times higher than in 1947, while in nonfarm industries it was 1.6 times as great.

Foreign Workers. The transition towards the elimination of foreign workers in favor of domestic farm workers continued but had not yet been fully completed. More than 500,000 man months of bracero (Mexican contract) labor were used in 1964; 27,000 in 1965; and about half of that in 1966. Three-fourths of the foreign workers in 1966 were British West Indians; two-thirds of them worked in Florida sugar cane; most of the rest picked apples further north. Employment of Canadians, mainly in northern potatoes and some in apples, declined 30 per cent to about 3,600 man months. The last Japanese contract worker left the country in September, 1966.

The Wall Street Journal for March 9, 1967, reported:

> The bracero cut-off clearly has accomplished one thing, however: Improving the lot of the farm workers who remain. According to Labor Department statistics, California's hourly farm wage rate climbed 22 cents from October 1964 to $1.58 in October 1966 as growers competed to attract workers . . . .
>
> While this was going on, the vast majority of the growers were hardly displaying the deep suffering they had so dismally predicted. From $3.67 billion in 1964, California's gross farm income climbed to $3.75 billion in 1965 and $3.95 billion in 1966. More importantly, net income, which dipped to $922 million in 1965 from $1.05 billion in 1964, rebounded to some $1 billion last year.

Housing. One of the greatest barriers to securing an adequate supply of domestic farm workers has been the lack of family housing. An eight-county survey made in California farm country showed that 80 per cent of the farm worker housing violated minimum standards of health, safety, and sanitation; 65 per cent of the housing was deteriorated and dilapidated; 33 per cent had inadequate sanitation facilities; 30 per cent had no bathing facilities; and 25 per cent lacked running water. This is, of course, a nation-wide situation and not peculiar to California. In New York State, a converted chicken coop in Portland was called typical of migrant housing. It was 3 stories tall and housed 400 workers in summer, 1966. It had no running water, only outside toilets, and most of the rooms had sharp breaks in walls or windows. A window that led to the building's only fire escape was nailed shut. (Within the past year, two serious fires have cost the lives of three migrant workers in upstate New York.)

Children. One result of migrant parents' substandard wages is that children are pressed into working to increase the family income. The present child labor provisions of the Fair Labor Standards Act provide a 16-year minimum age limitation during school hours for the school district where the minor lives while employed, and no minimum age is set for

work outside school hours. Minors employed by their parents are also excluded. Even with this inadequate legal protection for children, violations are constantly found by the investigators of the Department of Labor. In fiscal year 1966, 1,725 farms were found in violation, and 5,487 children were discovered working during school hours; more than half of these youngsters were between the ages of 10 and 13. It is estimated that approximately 375,000 children between the ages of 10 and 13 work in the fields.

Health. Farm workers lose more days due to sickness (an average 7½ days a year) than workers in all other occupations (average 6 days). More than 2 out of 10 farm workers have chronic health conditions that limit their activities, compared to about 1 out of 10 for all occupations. The Journal of Occupational Medicine for January, 1966, reports:

> Experience indicates that migrants generally have no greater incidence of venereal diseases and tuberculosis than other similar low-income nonmigratory residents. The migrant family does suffer, however, from diseases such as diarrhea, respiratory infections (including pneumonia), skin diseases, frequent pregnancies and complications of pregnancies, muscular aches and pains, and accidents and trauma. In past years, most communities have been able to provide little if any treatment for these conditions.

A survey taken by VISTA volunteers in Orange County, New York, in the fall of 1965, verified this situation in New York State, which has more facilities and less restrictive residence requirements than most states. Out of 258 farm worker family members, only 18.5 per cent had been immunized or innoculated for diphtheria, 20.3 per cent for tetanus, and 37.8 per cent for small pox; 13.8 per cent had recently had a tuberculin skin test, 44.4 per cent had had chest X-rays, and 21.4 per cent, a blood test.

Accidents. In the 20 states that reported injuries to farm workers during 1964, 1,400 involved children under 18 employed in agriculture. In 1965, agriculture again ranked as the third most hazardous industry, following mining and construction, according to the National Safety Council report, Accident Facts, 1966. There were 3,000 accidental deaths and 260,000 disabling injuries. Only 9 states and Puerto Rico provide workmen's compensation insurance for farm workers in the same manner as for other workers. Eight states provide coverage for specific agricultural occupations, usually the use and operation of machinery. A recent survey showed that only 42 per cent of all farm workers had hospital insurance and only 37 per cent had surgical insurance.

Legislation. In 1966, some 390,000 hired farm workers were included under the federal minimum wage law, although their hourly wage starts at only $1.00, an obvious poverty rate. But they are not yet covered by unemployment insurance, nor is their right to bargain collectively protected by law. Efforts to include farm workers' children under the protections given other children by the Fair Labor Standards Act have fallen short for many years. The major campaign at this time, spurred by organizing drives across the country, is to bring farm workers under coverage of the National Labor Relations Act.

Organization of Farm Workers

Most hopeful trend of the year was the upsurge in unionization of farm workers. Two major California farm worker unions merged into the United Farm Workers Organizing Committee, AFL-CIO. Although UFWOC has gained contracts with both Schenley Industries and the DiGiorgio Corporation, the strike goes on against about thirty other grape producers, and organization has yet to be extended to other branches of California agriculture. Outside California, the most important current organizing effort is at La Casita farms in Texas. A dramatic feature of organizing efforts has been the marches on state capitals to ask for a minimum wage and other farm worker needs. Such marches have been held in California, Texas, Wisconsin, and Michigan, and have attracted wide community support. Union efforts have not been confined to these areas. They have been felt up and down the East Coast, particularly in Florida. Sugar workers are organizing in Louisiana.

Federal Programs

Farmers Home Administration. Total rural housing loans in 1960 amounted to about $40 million; in fiscal year 1966, loans for rural housing, farm labor housing, and rural senior citizens' housing had risen to more than $266 million. Farm ownership and operating loans went from $43 million in 1960 to more than $233 million in fiscal 1966.

The latest in yearly FHA surveys of farm ownership borrowers shows that on the average, over a five-year period, they raised their gross cash income from $9,383 to $17,410 and made substantial gains in net worth. While this is an important indication of how much farmers need low-cost credit and how well they benefit from it, the very average indicates that the loan program is not reaching low-income farmers. Operating loans were at $276 million in 1965, about the same as 1962 but about $25 million less than during the 3 intervening years. Yet low-income farmers went without needed credit.

Economic Opportunity Loans through FHA have begun to reach farmers who were too poor to be serviced by FHA previously. Seventeen thousand rural families were aided in fiscal 1966. There were 28,011 individual loans totaling $48 million, and cooperatives serving

low-income rural people received 473 loans totaling $5.6 million, all since January, 1965. The average gross income of those who borrowed to finance nonagricultural enterprises increased from $3,112 to $5,862; for agricultural purposes, from $2,505 to $3,436.

Agricultural Stabilization and Conservation Service. In Alabama, Florida, Georgia, Kentucky, North Carolina, South Carolina, and Tennessee, only two Negro farmers (in Georgia) won seats on the county committees in 1966 ASCS elections, and these were as second alternates. In the same states, 302 Negro farmers have been elected to the community committees but only 68 as chairman, vice chairman, or regular member. The rest were alternates. The gain over 1965 is 28 community committeemen.

Food Stamps and Surplus Food. The Food Stamp Act of 1964 seemed a promising plan because the food stamps could be used at the grocery store for a more varied diet than was available through the surplus food program. But it was a substitute for, not in addition to, surplus food. The stamps must first be bought and the Act did not take into account the fact that the poorest people – like sharecroppers and tenants – don't have cash. In Madison County, Mississippi, 11,244 families participated in the surplus food program but when the changeover was made only 5,951 participated in the food stamp program. In Harrison County the number dropped from 9,500 families to 2,201, and the situation is duplicated throughout the South. Under current regulations in Alabama, a family of 4 with an income of only $45 a month must pay $18 to receive $56 worth of food stamps; a family of 4 with no income must pay $8 a month to receive $48 worth of food stamps. The Secretary of Agriculture has legal power to distribute free surplus foods during "emergency" situations, even in communities which have food stamp programs. He could also develop realistic payment scales so that food stamps could be free for those without money. NSF and the newly organized Commission on Rural Affairs of the Citizens' Crusade Against Poverty are pressing for such action.

A Program for Rural America

If present trends continue, the next quarter of a century will see 100 million more people crowded into the great urban centers where already 7 out of every 10 people live. The mounting crisis of noise, dirt, and smog; poverty and illiteracy and despair; racism and tension and violence, will convulse the nation.

This need not be. Pilot projects in which the National Sharecroppers Fund has played a part have already demonstrated that poverty can be attacked successfully in the rural areas and the forced exodus from the land can be halted. Manpower training programs combined with crop diversification and loan assistance have enabled poor farmers to raise their incomes 100 per cent. Marketing co-operatives such as the West Batesville Farmers Association (Miss.) and the MidSouth Oil Cooperative (Tenn.) are saving small farmers money and helping them to increase their incomes. Farmers in South Carolina, Georgia, and other states are building low-cost homes.

But pilot projects are not enough. All rural people need literacy and skill training. Massive economic and technical assistance is needed if hundreds of thousands are to stay rather than migrate. Discrimination, repeatedly protested by NSF, against Negro farmers – and indeed against all small farmers – must end.

And because rural communities and areas have been impoverished along with their people, public investment is needed to build the roads, schools, hospitals, and other public facilities they need in order to attract new industries and institutions. From a quarter to a half million new jobs could be created to meet these basic rural needs. This new tax base, and increased purchasing power, could begin to break the cycle of poverty and start the spiral towards abundance.

National Sharecroppers Fund

*works in Alabama, Arkansas, Florida, Georgia, Louisiana, Mississippi, South Carolina, and Tennessee, helping poverty-stricken people learn how to help themselves;

*cooperates with other concerned organizations, particularly with the Southern Regional Council and its state councils on human relations in the field, and with the Citizens' Crusade Against Poverty in Washington;

*works to end the exclusion of agricultural workers from the protections and benefits of social legislation that other workers enjoy;

*supports the efforts of farm workers in organizing unions, and guides low-income farmers in organizing cooperatives;

*carries on extensive educational work through: publishing and widely distributing printed materials; presenting testimony before governmental agencies; supplying speakers and informational services for a great variety of public groups; maintaining contacts with the press and other media;

*works with government and private agencies to help low-income rural people build a better life.

National Sharecroppers Fund – 112 East 19th Street, New York, New York 10003

The Nation 10/20/69 Migrant Labor

quence of maintaining the inequities of the court-martial. Two other developments, which have already begun in the federal courts, could seriously limit the independence and jurisdiction of the system. First, on June 2, 1969, in *O'Callahan v. Parker*, the Supreme Court ruled that a serviceman charged with a non-service-connected crime committed off post cannot be tried by a court-martial and thus denied the right to grand jury, trial by jury of his peers, and the other rights provided by civilian law. The Court made no bones about the inferior quality of the court-martial or its belief that a serviceman, under the circumstances of this case, should be given all the rights provided in a civilian court. Second, certain federal courts have in the last year displayed a greater willingness to accept jurisdiction of suits brought by servicemen who challenge the legality of various types of military determinations.

Both developments appear warranted by the present state of military justice. Unless reforms are made in the code, it is likely that still more cases will be removed from court-martial jurisdiction and that expanded review of military determinations by federal courts will bring the military under greater civilian control. The state of military justice is very much in flux, as the defects of an anachronistic system of criminal law have suddenly manifested themselves. The Congress has a clear duty to legislate sufficiently sweeping reform to overcome the disquieting fact that 3.5 million servicemen are bound by an inadequate system of criminal justice.

OPERATION SISYPHUS

Wetbacks, Growers and Poverty

SHELDON L. GREENE
Mr. Greene is general counsel for California Rural Legal Assistance and a specialist in litigation challenging the employment of nonresident alien labor.

San Francisco

The *bracero* program died in 1968, after a long illness. Under its provisions, 4.5 million Mexican temporary workers were brought into the United States between 1942 and 1963 as supplementary farm labor. Officially terminated by Congress in 1963—long after the World War II labor shortage which it was intended to ease had ended—it finally trickled to a halt in August 1968 when Secretary of Labor W. Willard Wirtz denied a request by California tomato growers for 2,200 Mexican farm workers. He characterized this refusal of legal entry as "a historic step towards healing the migrant worker sore in California and in the entire United States." But current 1968-69 immigration records show the apprehension of 150,000 Mexican nationals who had entered the United States illegally, and the incidence of these wetbacks in American employment is perhaps triple the number caught. This would suggest that Secretary Wirtz's cure is at the most cosmetic.

Illegal entry by Mexican nationals has afflicted domestic low-income workers since World War II. In 1942, after Mexico had agreed to supply temporary workers under the *bracero* program, Texas farmers refused to meet agreed wages and working conditions. In response, Mexico for a time cut off the supply of workers, but U.S. Immigration authorities permitted thousands of Mexicans to cross the border illegally. They were then apprehended and "paroled" to Texas farmers, thus avoiding the terms of the international labor agreement. Farmers and border industries got cheap labor; domestic farm workers and El Paso garment workers and meat packers suffered wartime inflation but were forced to accept low wages if they wanted to work at all.

In 1954 the President's Commission on Migratory Labor studied the border labor problem and concluded: "The United States, having engaged in a program giving preference in contracting to those who had broken the law, has encouraged a violation of the immigration laws. Our government has thus become a contributor to the growth of an illegal traffic which it has responsibility to prevent."

That same year, the Justice Department launched Operation Wetback, a roundup of more than a million illegal entrants in an area stretching as far as St. Louis and Chicago. San Antonio alone harbored 331,000. The roundup seemed so successful that the Immigration and Naturalization Service stated optimistically in its 1955 report that it had ended the wetback problem. The boast proved premature.

The Border Patrol and the Investigation Section of the INS are diligent, outnumbered and outmaneuvered. The comparatively few illegal entrants who attempt to cross the natural, and for the most part barren, frontier on foot are easily spotted by the continual overhead observation

PAGINATION INCORRECT

of Border Patrol spotter planes; they are then picked up by ground patrols which run along exfoliated drag strips. Some few aliens risk their lives in airless car trunks and campers, or precariously flattened on a ledge beneath passenger cars. Such trips cost from $100 to $300. One recently ended in death by asphyxiation.

But for 70 to 80 per cent of the illegal entrants access is neither hazardous nor romantic. More than a million Mexican aliens carry visitors' permits. These salmon-colored cards, issued by the Mexican Government at a cost of about $80, authorize visits of seventy-two hours in an area not more than 25 miles from the border.

But the aliens, most of them, are not looking forward to a visit. The typical wetback meets an agent in Mexico who provides him with a routing or a contact. Once across the border, he is transported to a city, often Los Angeles, and there referred to a job. In some instances, the agents provide transportation by selling a group of wetbacks an automobile, in which they can better elude detection. Those who lack the cash are offered a "go now, pay later" plan under which the price of the car is deducted from future wages.

Once inside, the alien easily merges into urban or rural Chicano barrios. Anyone can get a Social Security card by filing an application; proof of legitimate entry or birth certificate is not required. Employers record the Social Security number and couldn't care less about the worker's status. It is a felony to induce an alien to enter the United States, to transport him or to harbor him from detection; but conservative legislators from farm-districts have managed to exempt the employer of an illegal entrant from that chain of complicity, even when the employee is known to be a wetback.

Agriculture absorbs the bulk of the illegal entrants. During fiscal 1968, 38,950 of those apprehended were doing farm work. Wetbacks are preferred by most farmers because they are thought to work harder than Americans and to complain less about conditions. The minimum wage for farm work in California is $1.65 an hour; wetbacks in labor camps are lucky to earn $1.35, not enough to live on in California but four times the Mexican minimum wage. The rich regions of California are dotted with the grim labor camps which formerly housed *braceros*. Wetbacks now live in many of them, hidden well off public roads on land posted against trespassing.

While most wetbacks seek farm work during the busy seasons, substantial numbers are kept on the year around, or find off-season jobs during the very periods when domestic farm workers, residents of the area, are unemployed and dependent on public assistance. Winter unemployment in farm regions runs as high as 16 per cent of the domestic labor force; in California alone idle farm workers require $15 million in public assistance. Ten thousand wetbacks were caught in the five states that make up the Southwest in February 1969. From this figure one can assume that from 10,000 to 40,000 low-income families were displaced from jobs by wetbacks during the winter months, at a cost in taxes and loss of domestic wages amounting to tens of millions.

Surveys show that the prevalence of wetbacks also depresses wage levels, and encourages employers to ignore the laws governing wages and working conditions. Union leaders find it difficult to organize in areas saturated with wetbacks. A nationally reported example is the stubborn resistance Cesar Chavez's United Farm Workers Organizing Committee has encountered in its efforts to sign contracts with the California table grape growers. Strikes are not a compelling argument with employers who can rely on Mexican nationals, and the union has been forced to organize a nation-wide consumer boycott of table grapes to achieve its purpose.

Displacement of local workers by wetbacks is no longer a predominantly rural problem, since illegal entrants increasingly gravitate to more permanent jobs in the cities. From 1,500 to 3,000 of them are caught each month in the Los Angeles metropolitan area. Recently, the Border Patrol uncovered a smuggling operation which specialized in supplying wetbacks for industrial jobs in Chicago.

Despite the seemingly impressive figures on apprehensions, the wetback problem is not being brought under control. The program is hampered from the start by a shortage of manpower and equipment. As one patrolman in the Stockton, Calif., area put it: "We stake out Route 99 and the smugglers hear of it and take another road. There aren't enough of us to cover all the main highways all the time." On any given day, approximately 300 officers are on duty in the five Southwestern states.

A more basic problem than the size of the Border Patrol is the ease of entry afforded by the visitor's card and the absence of administrative controls on its use. The zone of travel permitted by these cards (with no record kept of entry and departure) was recently reduced from 150 to 25 miles from the border and that is making it easier to tag violators en route to the big cities. Since the reduction, systematic road checks on approaches to Los Angeles have turned up hundreds of aliens with no residency documents.

However, Border Patrol officials complain privately of the Justice Department's failure to require fingerprints as part of the permit procedure. Lacking that identification, it is almost impossible to spot previous violators when they reappear at the border, and wetbacks who have been returned to Mexico re-enter again and again, visitor's permit in hand. Also, since no record is kept as to when a seventy-two-hour visit begins, a Mexican who has eluded detection for weeks or months can depart unquestioned.

The very volume of violators has dictated an informal handling of those caught, and this also fails to discourage the increasing traffic. Illegal entry is a crime for which the violator may be prosecuted in the federal courts and formally deported by the INS. Re-entry after such a deportation is a felony. But resort to these remedies is infrequent. The present policy is to allow the illegal entrant to leave voluntarily within three days of apprehension. Often he is permitted to get to the border on his own. Or he may be taken to a detention center in El Paso, Tex., or El Centro, Calif., to await bus transportation to the interior of Mexico at U.S. Government expense. Not only does the wetback get a free trip home but back wages are collected for him by Border Patrolmen. Voluntary return is likened by an INS administrator to a "game

warden who discovers a hunter without a license and helps him carry the deer he's killed out of the park." Multiple returnees are seldom prosecuted and are formally deported only after the fourth, fifth or sixth entry, unless they are caught assisting other wetbacks to cross the border. A formal deportation procedure takes no more than fifteen minutes, and does not require the services of an attorney, but the INS claims that there are insuf-

Fortune

ficient hearing officers to handle all the possible cases and that in any case deportation wouldn't stop the alien from trying again. Authorities do not even officially notify a grower when illegal entrants are found on his land.

United States attorneys and judges regard illegal entry as an economic crime of low priority and most Americans sympathize with the wetback, who is after all a very poor man trying to get ahead. Few jurists or juries appreciate the relationship between illegal entry and the plight of the domestic poor. Federal prosecutors have little time even for wetback smugglers, accepting only aggravated cases for prosecution. Despite the high apprehension rate in Northern California—3,500 in August 1968—there has been almost no prosecution of smugglers or transporters. Officials suggest that strict enforcement, involving due process for each alien, would choke court dockets, overburden U.S. attorneys and tie up patrolmen as witnesses. The more pessimistic add that extensive prosecution would ultimately fill the prisons to capacity—a line of reasoning not applied to marijuana cases. INS investigators are hampered by the taciturnity of wetbacks, who refuse to say how they entered the country or who helped them to do so. Aware that failure to cooperate will not land him in jail, the alien has no inducement to reveal what he knows of the smuggling operation.

Recent lawsuits brought in California by domestic farm workers against growers using wetbacks allege that such employment is an unfair business practice calculated to lower their wages, diminish their employment opportunity and force them to seek public assistance at the taxpayers' expense. While employment of illegal entrants is exempt from the legal sanctions against harboring wetbacks, farm workers charge that growers are nevertheless criminally implicated, since offering wetbacks employment and shelter from detection is aiding and abetting in the crime of illegal entry. This resort to self-help law enforcement by the poor is a reflection on the failure of the Justice Department to perform its duties.

The ambivalence of the INS in the area of illegal entry is striking. The search for violators is persistent but ineffectual, and it seems clear that more could be done. The service operates on a budget of $86,450,000, more than half of which is committed to the four states bordering Mexico. Detention and transportation of apprehended illegal entrants alone costs $1.6 million, yet no funds can be found to hire more hearing officers and increase the number of formal deportations. Nor is there money to increase the Border Patrol and investigation staff, despite increased illegal entry and the much heavier work load demonstrated by the higher apprehension rates.

An obvious need is the fingerprint identification of seventy-two-hour permit holders. INS officials argue that it would be impractical to match the fingerprints of apprehended wetbacks against those of 1 million cardholders. Yet the need to check at most 500 fingerprints a day, the ostensible average number of wetbacks caught in the peak months, is small compared to the FBI's work load of 32,000 identifications a day from a file of 15 million sets of prints.

The replacement of cards at four-month intervals would make it easier to revoke the cards of violators. A requirement that holders of the unlimited entry permit post a bond to secure observance of the terms of entry, a device authorized in related immigration laws, could be an effective deterrent. Other steps could be taken to provide more effective enforcement. A recent act which authorizes a federal magistrate to handle petty crimes could undoubtedly speed the prosecution of numerous smuggling offenses as misdemeanors. Formal deportation following the second illegal entry within two years, the power to assess administrative fines in lieu of prosecution (thereby attaching a portion of the wages earned), and even the right to confiscate the vehicle used in the transportation of illegal aliens, as is done in narcotics smuggling, would also discourage the border hoppers.

Important remedial legislation is before House and Senate. A bill to prohibit the intentional employment of a person illegally in the United States was introduced on March 26, 1969 by Sen. Edward Kennedy and Rep. Michael Feighan. The measure is co-sponsored by nine Senators and twenty-three Representatives. But even if passed, it will not result in many prosecutions, since the present difficulties of proving smuggling will be compounded when the federal attorney must submit his case to a jury. However, the abrogation of the employment exemption, combined with occasional well-publicized prosecutions and stiff fines, should cure many employers of hiring wetbacks at bargain rates. Similarly, a bill introduced by Senator Mondale would amend the National Labor Relations Act to make it an unfair labor practice to employ aliens unlawfully present in the country, or to

hire nonresident commuter aliens during a labor dispute. Any of these measures, applied for several years, would provide increasingly effective deterrence to illegal entry.

Even so, the problem of the wetback will remain as long as the Mexican-American border is open, the border economies remain interdependent, and American earnings are five to ten times the Mexican wage. But in our increasingly technological society, with its chronic unemployment among low-income unskilled and semi-skilled workers, it is a problem which cannot be ignored. The continued use of nonresident Mexican labor in border areas, a concession to the artificiality of the border, should be coupled with affirmative enforcement of wage standards and labor laws to provide domestic workers with earnings commensurate with living costs, at least equal access to jobs, and the freedom to bargain collectively.

Moreover, urban and rural areas distant from the border have no interdependence with the Mexican population and economy. Lack of enforcement in such places, except for the futile apprehension-return cycle, is really a subsidy to certain industries and subverts the Administration's policy to "move people off the welfare roles and onto the payrolls."

Despite the good record of the Border Patrol, administrative deficiencies in coping with the inflow of illegal entrants cannot be explained entirely by a lack of imagination or a lack of funds. It is not pure fantasy to conclude that the policy of the Justice Department on illegal entry is to do just enough to avoid wholesale criticism, without arousing the serious anger of anti-union employers who favor an abundance of cheap labor.

Modern Biology: A Terrifying Power

S. E. LURIA
Mr. Luria is Sedgwick Professor of Biology at M.I.T. He is the author of General Virology *(John Wiley & Sons).*

In the past twenty years, one has heard much talk of a biological revolution and of its consequences for mankind—not only in medical and economic achievement but in the nature of man itself. Man may soon be able to influence his own heredity directly, rather than only by the indirect process of eugenics. Scientists and science writers discuss such prospects with an uneasy mixture of optimistic predictions of benefits to come and dire warnings of possible catastrophes—as in Desmond Taylor's *The Biological Time Bomb*. Here I shall attempt to examine briefly the scientific basis of the expected developments, their probable nature, and the responsibility they present to both scientists and the public.

What has happened in biology in the last two decades is not a revolution but a scientific fulfillment. Modern biology started about 100 years ago with the foundation of Darwin's theory of evolution, which ties together all living organisms, past, present and future, into a single historical process of parenthood. The achievement of the last decades is the understanding of the nature, function and changes of the organic substrate of evolution, *the genetic material*, which is the stuff that carries from one generation to the next the set of instructions that dictate what an organism is, how it responds, and what kind of descendants it will in turn produce.

By 1952 the material of the genes was identified chemically as consisting of nucleic acid—generally (except in some viruses) desoxyribonucleic acid or DNA. In 1953 Watson and Crick proposed for the structure of DNA a model—the famous double helix—which not only proved to be correct but opened up entire new approaches to the study of the chemistry of heredity. Within the last sixteen years biologists have come up with the following satisfactory picture of what genes are and how they function.

A gene is a certain stretch in a long DNA fiber contained in the chromosomes of the cell nucleus. It carries in chemical imprint the detailed instructions for making both new copies of itself at each cell division and disposable "subcopies" or messages, which are used as instructions for synthesizing all the machinery of the cell. The messages are molecules of another kind of nucleic acid called RNA.

Gene structure and gene function are not immutable—if they were, evolution and development could not take place. On the one hand, the structure of genes can change by mutation, a relatively rare accidental change in chemical composition. Natural selection then brings about evolution by selecting for reproductive success those individuals endowed with particular genetic constitutions. On the other hand, the function of the genes in a cell is regulated by the environment, including the action of other genes in the same cell, the chemical messages from other cells, and also the external environment such as food and temperature. Thus while all cells of a complex organism have identical sets of genes (barring rare mutations), they function differently because some of their genes (which may number from a few thousand to several million, depending on the organism) receive different environmental signals.

The relevant point for this article is that all the essential features of the genetic process, insofar as they have been clarified, have turned out to be interpretable in strictly biochemical terms. No new principle or phenomenon has emerged to justify the assumption that some unique "vitalist" principle is at work in biological processes. This point is essential to a grasp of the present status and future course of biological technology. What molecular biologists have done is to make the genetic mechanism directly available to chemical experimentation. Arthur Kornberg and other biochemists have purified DNA from bacteria, viruses and from animal cells, including human cells. They have then caused it to produce more copies of itself in the test tube, under the influence of enzymes extracted either from the same organism or

Closing the Gates

Economic Woes Dampen Welcome Once Received By Migrant Workers in Western European Lands

By BOWEN NORTHRUP
Staff Reporter of THE WALL STREET JOURNAL

In France, the government has passed the word to employers: When a job becomes vacant, an effort must be made to fill it with a Frenchman before a foreigner is hired.

In West Germany, many of the two-year work permits given foreign workers aren't being renewed.

In some old sections of Rotterdam, residents complain of Turks buying up houses and sleeping six to a room. The Dutch government, too, is considering curbs on foreign workers.

For two decades or more the growing and prosperous nations of Western Europe have actively recruited foreign workers, sometimes even offering such inducements as subsidized housing and radio or television broadcasts in their own language. In the Netherlands and Germany, in fact, the official designation for the aliens is "gastarbeiter," or "guest laborer," a hospitable term.

But guests, of course, usually go home, and lately the welcome for the aliens has been wilting perceptibly. The chief reason: A recession whose effects linger in the form of rising unemployment around Western Europe. There also have been some unpleasant frictions involving natives and foreigners in France, Germany and the Netherlands.

A Problem, but No Panic

The movement traditionally has been from south to north. Spaniards, Greeks, Italians and Portuguese—and, more recently, Turks, Yugoslavs and Moroccans—have come to the prosperous northern nations to wait on tables, work in the construction industry and take the "dirty" jobs in various other industries.

There seems to be no panic about the migrant worker problem in the six-nation European Communities. In Brussels, a spokesman at the EC Commission says, "Yes, there has been friction in many places—but not on a scale that you would be anxious about."

Still, there are often-bitter campaigns to curb foreign workers, campaigns that tend to give little credit for the jobs foreigners do. Switzerland, with a labor force that is about 30% foreign, is cutting back. But, says one labor expert, "If all the foreigners left today, 80% of Switzerland's construction work would halt tomorrow."

In job-hungry Britain, a spokesman for a hotel and restaurant group recently complained of thousands of positions unfilled; the natives, apparently, consider a waiter's job demeaning. In France, there is acknowledgement that foreigners are needed, even in hard times, to fill the "dirty" jobs that Frenchmen scorn. But even these unpleasant jobs must first be offered to locals before foreigners can be hired now.

"Phenomena of Intolerance"

"In a period of slackening production, it would be absurd and contrary to the interest of the immigrant workers to make them come to France and condemn them to become unemployed," said Labor Minister Joseph Fontanet.

"A too massive influx of foreign laborers," he added, "can touch off phenomena of intolerance, since their integration into the French community can't be carried out adequately." There has been friction with Algerians, and the government recently took steps to limit Algerian immigration to 25,000 persons a year.

The Dutch government is preparing legislation to limit the entry of foreigners. It probably will put on employers who request workers the onus to house and vouch for them during the tenure of their work permits. In any case, says a Dutch official, "Demands from employers for workers are going down sharply."

About 16,000 foreign workers entered Holland last year. The figure this year is expected to be about 10,000. The Dutch government is wrestling with a trickier problem anyway: The influx of immigrants, many of them destitute, from the former colonies of Curucao and Surinam. These persons hold Dutch passports, and they qualify immediately for social benefits.

nA "Italian Village" in Germany

Germany, with about 2.13 million foreign workers, has been the most receptive nation to migrant workers from within and without the EC. Volkswagenwerk A.G., the big auto maker, boasts that it has created an "Italian Village" at its Wolfsburg plant.

There are community facilities, Italian doctors staffing a clinic, a religious installation operated by Missione Cattolica with an Italian priest in charge and even a court for playing boccie ball.

The German government maintains tight control over work permits and recruitment (the Central Labor Office has representatives in Turkey, Spain, Greece and other nations). When hard times threaten, recruitment of foreign workers is cut, and some workers are expelled.

During the 1966-67 recession, the number of foreign workers was cut by about 400,000, or about 20%. No such drastic change is in the offing now, despite rising unemployment, although recruiting has been cut back. The number of foreign workers has dropped by about 5% since last September.

In Germany, too, there have been tensions. Bavarian border police complain that Turks are smuggling drugs into Germany. And some Germans expressed alarm when the Italian Communist party recently established a West German office.

Within the Common Market the six nations already have tight control of labor from "third nations" (non-EC members) through work-permit rules and other legislation on immigration. Where new legislation is needed, it is likely to prove popular politically.

But free movement of labor within the EC is mandated by community treaties. Many Belgians, for instance, commute into nearby France and Germany. Similarly, Luxembourg draws on neighboring nations for its iron and steel industries (about 30% of Luxembourg's labor force is foreign).

The biggest contributor of intra-EC labor has been Italy. But there a natural corrective is at work; the Italian economy has pulled closer to parity with other EC nations, and fewer Italians want to leave home.

"You can't so much see Italy as a reserve of manpower any more," says Jean Geldens, an EC labor specialist. Nevertheless, some 80,000 Italians are likely to seek jobs elsewhere this year. The 1971 figure was about 100,000.

There has been some anxiety within the EC about the prospective entry of Britain into the community. Holland asked the Commission to investigate the situation with regard to Britain's large Pakistani and West Indian population. "They were worried that there would be an invasion," says Mr. Geldens.

Examination disclosed that the so-called "colored" people form only a small minority of Britain's more than one million unemployed. Holland's fear of new drains on its social services proved largely unfounded also with regard to its foreign workers. Although 140,000 persons now are unemployed there, only about 3,000 of them are foreign workers.

"A foreigner comes here to make money," says Adrian Vesseur, an official in the department of social affairs at The Hague. "If there is a possibility for work, he works."

JANUARY, 1973

THE AGENCIES

Office of Economic Opportunity

"In 1974 responsibility for certain programs now funded through the Office of Economic Opportunity will be assumed to other agencies, as follows: the migrant program will be delegated to the Department of Labor; Indian programs will be assumed by HEW: Community Economic Development program grantees will be funded by the Office of Minority Business Enterprise at Commerce; health projects will be transferred to HEW; research and development functions will be transferred to the agencies which have statutory responsibility in the fields of current OEO activity. In addition, legislation will be submitted to establish a Legal Services Corporation.

"No funds are requested for the Office of Economic Opportunity for 1974. Effective July 1, 1973, new funding for Community Action agencies will be at the discretion of local communities. After more than seven years of existence, Community Action has had an adequate opportunity to demonstrate its value. In addition to private funds, state and local governments may, of course, use general and special revenue sharing funds for these purposes. With Community Action concepts now incorporated into ongoing programs and local agencies, the continued existence of OEO as a separate Federal agency is no longer necessary." (Excerpted from the President's *Budget for Fiscal Year 1974,* p. 122.)

Housing Freezes: Congressional and Other Reactions

The Administration has labeled the nation's subsidized housing programs inequitable, wasteful and ineffective in meeting the housing needs of the country and as a result the Department of Housing and Urban Development (HUD) has had many programs placed under a severe moratorium and USDA's Farmers' Home Administration (FmHA) has had its funds almost totally frozen while an 18-month "evaluation study" is being conducted.

While outgoing HUD Secretary George Romney called his agency's cutoff a "temporary hold of indefinite duration," and said applications now in process would proceed, the FmHA freeze will mean that 83,000 low-income rural families will be deprived of $1.25 billion in credit in fiscal 1974.

(continued page 2)

LITIGATION

Mich. Sup. Ct. Overturns Workmen's Compensation Exclusion

The Supreme Court of the State of Michigan ruled early this month that the State's Workmen's Compensation Act excluding some farmworkers from coverage violates the farmworker's "rights to equal protection provided for in the constitutions of the United States and the State of Michigan." The landmark decision in *Gutierrez v. Glaser Crandell Company* (Michigan Supreme Court No. 53541, January, 1973) is a major victory for farmworkers who are excluded from labor-protective and benefit legislation in Michigan and sets solid legal precedent for attacks on exclusionary statutes in other states.

The accidents giving rise to the case occurred in 1967 when two migrant workers were injured while working for Glaser Crandell packing company. Claims were filed and a hearing was held before a workmen's compensation hearing referee in February, 1970. The referee's decision against plaintiffs was appealed to the Michigan Court of Appeals which held in 1971 that the exclusion of certain agricultural workers from the Workmen's Compensation Act was Constitutional, 34 Mich. App. 489 (1971). The Michigan Supreme Court has now reversed the Court of Appeals and remanded the case to the Workmen's Compensation Commission for a factual determination of plaintiffs' claims.

The Michigan Workmen's Compensation Act of 1969 (1969 PA 317) has two classifications of employers, "public" and "private"; and a single classification of employees, "every employee," MCLA 418.111; MSA 17.237 (111). In its most general terms then, the Act purports to cover all employers and their employees. Agricultural employers are dealt with in a separate section that attempts to exclude certain employers from coverage, MCLA 418.115 (d) and (e), MSA 17.237 (115) (d) and (e). The exclusions of section 115 (d) are based on the number of employees, their hours of work for the employer; and the manner in which the employees were paid (piece rate). Section 115 (e) sets up similar exclusions and provides for a limited medical and hospitalization plan coverage for certain agricultural workers.

The Michigan statute speaks in terms of covered or exempt employers; and the definition of agricultural employer is as broad as possible, covering all aspects of agriculture from planting to

LITIGATION

Farmworkers Face Another Season Unprotected by Pesticides

In May we reported an apparent victory for farmworkers. In response to a suit filed against the Department of Labor's Occupational Safety and Health Administration by MLAP and other groups on behalf of five farmworkers who had been poisoned by pesticides, OSHA had issued a temporary emergency standard for pesticides, prescribing reenty times and other safety procedures to be followed.

This temporary emergency standard was to take effect on June 25. However, within days of the issuance of the standard agribusiness interests began a heavy counter attack. Growers and grower associations filed law suits in every federal circuit court of appeals to enjoin enforcement on the standards.

In the Senate, Senator Ernest F. Hollings (D-S.C.), sponsored an amendment passed by voice vote, which would, if enacted, postpone implementation of all OSHA pesticide standards until formal hearings could be held by the Labor Department. Congress would then have 30 days to review the hearings before new regulations could become effective. Shortly thereafter, the House Committee on Agriculture accepted an amendment to the same bill to transfer Labor's authority over agricultural pesticides to the Department of Agriculture and void all OSHA standards to date. Both efforts have fortunately been defeated.

The Secretary of Labor responded even more rapidly than he had to the farmworkers' suit — by backing down; on June 15, he rescinded the emergency standard. He did promulgate as a substitute, a weaker standard to take effect on July 13. It would have covered only 12 of the original 21 organophosphate pesticides and the reentry intervals into the fields were reduced in some 33 instances, sometimes by more than half. The posting of written warnings, provided in the original standard, would no longer be required.

The shift in the Secretary's position is illustrated by the two standards treatment of parathion, a known killer. The original standard had required a lapse of from five to 14 days between the spraying and the workers' reentry into the field, but the substitute standards allowed immediate reentry into the fields.

Nevertheless, the agribusiness interests were not satisfied. They had obtained a definite postponement of the effective date of any standard from the Fifth Circuit Court of Appeals in New Orleans. The Secretary is defending the weaker standard there but the 1973 agricultural working season is now more than half over. By the time a decision is obtained farmworkers will have done without federal protection for yet another year.

Del Monte Sued on Grounds of Peonage

Del Monte Corporation for many years has employed migrant farmworkers from Southern and Southwestern states during the summer harvest season in Illinois. To recruit these workers Del Monte each year uses the free interstate recruitment services of the U.S. Department of Labor and participating state agencies including the Illinois Department of Labor.

This year Del Monte submitted four clearance orders for the recruitment of migrants to the Illinois Employment Service and the Department of Labor and then sent to labor supply states for workers.

When the workers arrived at Del Monte's Rochelle plant, willing and able to work, they found the actual employment situation far different from that represented in the clearance orders and the offers of work made by the Corporation and its agents. Little or no work was available and the workers found themselves subject to a wage deduction system which put them in a virtual state of peonage: many workers received a negative weekly pay check and others received so little that they had nothing to send home to their families.

Just as the workers had begun to work themselves out from under their debts to the company they were threatened with an influx of hundreds of additional workers from Texas for the corn packing season which meant they would again be placed in peonage and joined in it by the new arrivals because work would not be available for everyone.

Therefore the workers, represented by the Illinois Migrant Council, took Del Monte, DOL and the Illinois Department of Labor to court charging that this system violated their Thirteenth Amendment rights and the wage deduction system violated their rights under both the Fifth and Fourteenth Amendments of the Constitution as well as under the Fair Labor Stan-

LEGISLATION

Crew Leader Bill Expansion Sought

The Farm Labor Contractor Registration Act is one of the most important issues that has ever faced farmworkers, now or in the future.

Congressman William Ford, Chairman
Subcommittee on Agricultural Labor

In May we reported that Congressman William Ford (D-Mich.) had introduced a new crew leader bill. Senator Gaylord Nelson (D-Wisc.) has followed with a similar bill in the Senate. The two bills are almost identical except that the Nelson bill would require crew leaders to inform prospective workers of strikes in the areas in which they are to work.

Senator Nelson's bill, S. 2070, has been introduced in the Senate and awaits further action. The Ford bill, H.R. 7595, is now pending before the House Subcommittee on Agricultural labor. This measure amends the existing Act by extending its coverage and assuring its enforcement. According to Congressman Ford the original bill has "not achieved its original stated purpose of freeing the 'channels and instrumentalities of interstate commerce' from abuse by 'certain irresponsible contractors' who 'exploit producers of agricultural products, migrant agricultural laborers, and the public generally.' " The Congressman explained that his proposal was designed "to overcome the shortcomings which have been clearly demonstrated in the years that have passed since the present law became effective."

The Ford bill would extend coverage under the Act to farm labor contractors who recruit intrastate. The present Act includes only interstate recruitment. The bill would exempt day-haul operations from coverage, although day-haul operations on an interstate basis are covered under the existing statute.

Ford's bill would further raise existing insurance requirements for vehicle accidents to $10,000 for bodily injuries to or the death of one person; $50,000 for bodily injuries to or the dealth of all persons in any one accident; and $10,000 for the loss or damage to property of others.

The bill would create a federal civil cause of action for any person claiming to be aggrieved by a violation of any provision of the Act and prevents the award of damages for any prevailing party up to and including $500 for each violation plus attorney's fees and costs. In addition, the bill creates a subpoena power for the Secretary of Labor and authorizes the Secretary to maintain civil actions seeking injunctions against violations of the Act.

The bill creates the possibility of a jail term of up to six months for criminal violations of the Act in addition to the existing $500 fine provision. It provides that a registrant who fails or refuses to exhibit his registration as required under the Act shall be denied facilities and services of the U.S. Employment Service. The statute's present annual registration requirement would be changed to every three years.

As the Act now exists, the Department of Labor is authorized to initiate investigations and enforcement. Part of DOL enforcement to date has consisted of a voluntary compliance program that provides: "Except in cases of willfulness, prior to making any recommendations to revoke or suspend a Certificate of Registration or Farm Labor Contractor Identification Card in cases which compliance can be achieved, the Regional Administrator shall call to the attention of the holder of or applicant for a Certificate of Registration or Farm Labor Contractor Identification Card, the facts and conduct upon which he intends to base his recommendation. He shall afford such holder or applicant a reasonable opportunity to demonstrate or achieve voluntary compliance."

One day of hearings have been held on the amendments and additional hearings are expected later this fall. Persons interested in the bill should direct comments to Congressman Ford or other Subcommittee members from areas of migrant farm work including William Steiger (R-Wisc.) or Earl Landgrebe (R-Ind.). They can be reached in the U.S. House of Representatives, Washington, D.C. 20515.

Roybal Introduces Bill to Coordinate Migrant Services

Congressman Edward R. Roybal (D-Calif.) has recently introduced a bill that would establish within HEW a National Office for Migrant and Seasonal Farmworkers which would meet more effectively the needs of this client group. The Office would administer all of the laws and programs within the

ATTEMPTS MADE TO PREVENT CREW LEADER ABUSES

Senator Gaylord Nelson, Chairman of the Senate Subcommittee on Employment, Poverty, and Migratory Labor, plans to hold a day of hearings on amendments to the Farm Labor Contractor Registration Act of 1973. The hearings will be held on February 8th in Fresno, California. Fresno is in the migrant stream, and it is anticipated that the location will make it easier to obtain testimony on abuses and lack of coverage under the present Act.

The Farm Labor Contractor Registration Act of 1963 was intended to protect farmworkers from false or broken employment promises by contractors who recruit and transport workers interstate. The present Act requires contractors to provide earnings statements for their workers, to obtain vehicle liability insurance, to keep employment records, to register with the Department of Labor, and to carry proper identification. However, in addition to problems of enforcement, the present Act applies only to independent farm labor contractors who recruit ten or more workers at any one time on an interstate basis. Nelson's amendments would extend coverage to *intrastate* recruitment and would require crew leaders to inform workers of strikes in the areas of their prospective employment.

On November 9th, William Ford, Chairman of the Subcommittee on Agricultural Labor, held hearings on the House version of the crew leader bill. Eugene Bonfiglio, DOL's Supervisory Farm Labor Enforcement Specialist of the Employment Standards Administration Wage and Hour Division, testified on the problem of placing ultimate responsibility for violations. To date, there has been some doubt as to whether the crew leader or the grower has ultimate responsibility.

Mr. Bonfiglio said that an amendment which places the responsibility on each grower to hire a registered farm labor contractor would not delay the registration process, and, therefore, the growers' harvest would not be delayed. By effect of recent court decisions, the crew leader *and* the grower are jointly responsible only when the grower has the power to direct, control, or supervise work, or determine pay rates or method of payment. This has no bearing on situations in which the grower does not have such power. The extreme mobility of farmworkers and crew leaders makes enforcement difficult if joint responsibility can not be established.

At the Ford hearings, Bernard De Lury, Assistant Secretary for the Employment Standards Administration, expressed concern that not enough is being done to enforce the Act and that what is being done is neither uniform nor regular. Mr. De Lury called for annual crew leader registration, rather than one every three years. Mr. De Lury also revealed that in a spot check of 900 contractors in 1973, there were 375 violations for failure to register, 321 violations for failure to post notice, 184 violations for failure to keep records, 289 violations for failure to give earnings statements to workers, and 183 violations for failure to insure vehicles. Seventy-three percent of the spot checks revealed multiple violations. Of the 5,000 crew leaders subject to the Act, Mr. De Lury estimated that only 1,855 had registered in 1973 and that only two contractors were prosecuted since the Act went into effect.

Legal Services Bill Postponed

The Senate version of the legal services bill has been postponed for consideration until January 28th. The bill would amend the Economic Opportunity Act of 1964 to provide for the transfer of the Legal Services program from the Office of Economic Opportunity to a Legal Services Corporation. Two attempts were made to break off what had been described as "amendment by filibuster." The "filibuster" by Jesse Helms (R-N.C.) and Southern and conservative senators has, thus far, been successful. A cloture motion on December 13th failed by four votes and on December 14th by one vote. Action for Legal Rights, a Washington-based lobby group uniting such supporters as *The New York Times* and the American Bar Association, expects that the necessary two thirds needed for cloture will be obtained late in January or early in February. The departure of Melvin Laird from the White House is seen as a danger to the possibilities for a strong final bill. Mr. Laird is the only principal member of the Nixon Administration to react positively and publicly to the concept of a Legal Services Corporation. Following passage by the Senate, the bill will then go to conference where there are a number of amendments which would dilute the strength of the Legal Services Corporation. One amendment, by Rep. Edith Green (D-Oreg.), would eliminate (among a number of related programs) the 16 national backup centers, of which MLAP is one.

M— Migrant Labor

Dorothy Nelkin

on the season:

aspects of the migrant labor system

ON THE SEASON: ASPECTS OF THE MIGRANT LABOR SYSTEM

Following a factual introduction on the migrant labor system as it operates in New York State, this book presents three essays on specialized dimensions of the system. The analysis is based on systematic, ethnographic observation in migrant labor camps. The first essay deals with employment relationships in agriculture and their effect on the migrant worker. The second concerns the bearing of unpredictability--characteristic of the migrant labor setting--on life-style within a labor camp. The third deals with the relationship of the migrant to the larger society, documenting the "invisibility" of a group which has remained outside the mainstream of society.

The theme of the book is the process by which people adapt to an environment in which they are trapped. The migrant environment is shaped by such factors as physical and social exlusion from the wider society, an uprooted pattern of life marked by the necessity for geographic mobility, the conditions of stoop labor, and the dependence and powerlessness imposed by living in an employer-owned camp. The essays illustrate how adaptation which makes daily life viable within these circumstances, may limit the potential for social change and reinforce the social-economic marginality of a group.

This book is intended both for social scientists, with analytic interests in the social process within a particular setting, and citizens with concerns for a major problem in our society. The essays are an adjunct to a forthcoming volume co-authored with William H. Friedland, to be published by Holt, Reinhart, and Winston.

DECEMBER–JANUARY, 1972

LITIGATION

Dept. of Justice Indicts Two on Peonage Charges

Attorney General John N. Mitchell announced that two Florida men have been indicted on federal charges of holding at least nine farm workers in peonage and involuntary servitude in South Carolina.

Mr. Mitchell said a sealed indictment was returned August 27, 1971, in U.S. District Court in Columbia, South Carolina, and unsealed on January 4, 1972.

Alphonso Campbell, Jr., the leader of a crew of migrant farm laborers, of Wimauma, Florida, and his assistant, James Harris, also of Florida, were accused of holding laborers against their will during July and August, 1971, while the crew was picking peaches in the Spartanburg area.

Campbell was arrested on October 8, 1971, in Ruskin, Florida. Harris has not yet been arrested.

The eight-count indictment charges both men with three counts each of holding men in peonage and of holding them in involuntary servitude, and one count each of conspiracy to commit those offenses. Harris and Campbell are black, the workers are white.

According to the indictment, the defendants held at least nine men after transporting them from Atlanta, Georgia, to work on the crew near Spartanburg. It alleges that they charged their victims exhorbitant amounts for such items as wine, soap, razor blades and cigarettes and forcibly prevented them from leaving before their debts were paid.

The indictment said Campbell and Harris beat one migrant laborer who attempted to leave the camp on July 4, 1971, and forcibly removed his clothing as an example to the others that such attempts to leave would not be tolerated.

The maximum penalty for each count of both peonage and involuntary servitude is five years in prison and a $5,000 fine, and five years and $10,000 for the conspiracy charges.

Unprecedented $600 Million Suit Brought Against USDA

On December 23, in an unprecedented action, New York City and the State of Pennsylvania joined the National Welfare Rights Organization and nine poor families in a suit against the U.S. Department of Agriculture. The suit seeks to prevent massive cuts in the Food Stamp Program that have been ordered by the Department. At stake is approximately $600 million in annual food stamp benefits that plaintiffs claim will be wrongfully taken away from them.

The class action suit was filed in Federal District Court in Washington, D.C., on behalf of all poor people in the country who will be harmfully affected by the Department's new regulations. Currently, about 10 million persons participate in the Food Stamp Program.

The suit seeks to enjoin the Agriculture Department's implementation of a new Food Stamp allotment schedule. The nine families allege that the new allotments are too low to meet basic food needs. The suit contends that the Agriculture Department is violating the Federal Food Stamp Act and must increase the size of the new allotments. The 1971 amendments to the Food Stamp Act require the Department to establish allotments high enough to "permit low-income households to purchase a nutritionally adequate diet." The plaintiffs say, however, that the Department's planned allotments are set so low that the millions of food stamp recipients will be afflicted with hunger and malnutrition. The new allotments are scheduled to take effect during January and February in most states.

Quoting USDA figures, the papers filed in court assert that the cost of a minimally nutritional diet in the Northeastern United States is well above the value of the stamps that participating families will be entitled to receive under the new allotments. The figures quoted by the plaintiffs show the cost of purchasing foods listed in the Department's "Economy Diet Plan." The plan is an austerity diet that is the basis of the Food Stamp Program's allotment calculations. It is the cheapest of five diet plans that the Department devises for American families. The Department acknowledges the long-term nutritional inadequacy of the Economy Diet Plan. Department publications describe it as being intended for "emergency use" and "temporary use when funds are low." But plaintiffs say that even the foods in the Economy Diet Plan will be beyond their reach under the new food stamp allotments.

Ronald F. Pollack, who coordinated this project, is a staff attorney with the Center on Social Welfare Policy and Law in New York City who recently won an injunction ordering USDA to concurrently operate the Commodities Program with the Food Stamp Program in Seattle, Washington. Mr. Pollack stated that:

> The Department's new regulations, if not stopped by this suit, may cause many states to entirely drop out of the Food Stamp Program. The meager benefits that the Agriculture Department now wants to provide are too little for any meaningful participation in the Food Stamp Program. If these regulations go into effect, millions of poor people who are hungry and undernourished will be left without sufficient food for themselves and their children.

FEBRUARY–MARCH, 1972

THE AGENCIES

New Food Stamp Regs: Stream Application Last year Congress made several important changes in the Food Stamp Program. While it left some of the problems farmworkers have always had in obtaining food stamps unresolved it did include some new provisions which could benefit—or harm—them.

Although to be eligible for food stamp benefits workers must register with local agencies by May 1, 1972, the states are only now completing their food stamp plans and submitting them to USDA for approval. As the state plans are approved, farmworker programs must be able to deal with local and state agencies to make sure their clients receive the fullest benefits obtainable under the regulations. Therefore they must be thoroughly familiar with some of the problems inherent in the new program.

We hope that the following analysis of some of the most important provisions of the program will prove useful to those who are working with farmworkers. However, we have not attempted to cover all the changes in the new regulations or discuss unchanged provisions. If after reading our comments you have any questions on the application of the regulations—either new or old—please contact us, and we will try to help in any way possible.

Determination of Earnings: A major problem that must be overcome in almost all states is the old one of how to determine the exact amount earned by each farmworker household. As in the past, many food stamp agencies will attempt to rely upon what the growers tell them a worker is earning or what he paid for a day's work. The food stamp agencies should not be allowed to continue this policy and the applicant for food stamps must be helped in showing the agency what type of, and how many deductions were made by the grower from his gross pay. The agencies will accept source documents such as paychecks, employers' written statements, wage stubs, or income tax returns. Verbal verification is also acceptable.

While the agencies may be thinking in terms of local employment security offices for verification, there is no reason why they should not be able to check with the local OEO programs, as these programs are likely to have the most knowledge and experience in working with farmworkers. OEO programs should be in a position to challenge the agencies' estimates of anticipated incomes when they are unfavorable to the workers.

60-Day Extension Across County and State Lines: This provision should clearly benefit farmworkers if they are properly informed—simply and clearly in their native languages—of how this provision works. The provision allows farmworker families to be certified for food stamps for 60 days when they cross from one county or state to another—assuming all other requirements of the regulation are met, e.g., members of the "household" remain unchanged. It is the responsibility of the original certifying county to pre-

(Continued on page 2)

"The Last Yellow Bus"—Ditched? In June, 1971, the Department of Labor announced that it would institute a program of manpower retraining and related social services which would help migrant workers "attain economic independence and security and prepare them for year-round employment." The program—euphemistically called "The Last Yellow Bus"—would provide training for 5,800 migrant workers and is funded at over $20 million for fiscal 1972. It is scheduled to operate over the next several years providing training and other services tailored to fit the needs of the individual worker, his family, and the labor needs of his resident area.

That was in June. As of this writing only a small portion of the $20 million has been released. (For example on February 25, the Department announced a $3 million grant to Deganawidah-Quetzalcoatl University in Davis, California.) However, there is no indication of how much more, if any, funds are to be released in the near future. Based on information provided by persons who have negotiated regularly with the Department, we believe that the delays in funding are the results of pressure from the Department's regional offices and its state employment services, both of which want the Department to give them complete control of the funds. It has been suggested that the Department really wants to be able to delay funding and claim either a lack of qualified grantees or assert some other jurisdiction for the deadlock. Then at the end of the fiscal year, the Department would be able to release the remainder of the $20 million exclusively to the employment services—that being the only feasible way of disposing of the money short of returning it to the U.S. Treasury. Which is, of course, exactly what the employment services want.

When MLAP recently requested copies of all grant applications, program guidelines, and other data relating to the "Bus," under the Freedom of Information Act the Department failed to answer. When MLAP, through counsel, asked to consult informally with the Department on formulation of future policy, the Department ignored our letter.

The undesirability of giving the funds exclusively to the state employment services should be obvious. MLAP and 16 other migrant and farmworker-oriented organizations petitioned the Department in April of last year to abolish the employment services charging that they knowingly violated civil rights, safety, and minimum wage laws in their farmworker job referrals. The charges were backed with approximately 2,000 pages of verified

Pertinent to economic development? PW

THE COCA-COLA COMPANY FOODS DIVISION'S

AGRICULTURAL LABOR PROGRAM

A PROJECT IN PROGRESS

The following report outlines progress being made in The Coca-Cola Company Foods Division's Agricultural Labor Project in Florida. This report reflects accomplishments since the last report was issued on March, 27, 1972.

I. In the area of employment and working conditions, the following objectives and/or activities have been accomplished:

1) Following several months of negotiations, a contract was signed on February 29, 1972 between the United Farm Workers Union, A.F.L.-C.I.O. and The Coca-Cola Company Foods Division. The contract covers all farmworkers employed by the Company in its groves, both production employees as well as harvesting personnel, retroactive in its coverage to the first of the year. It is the feeling of the Company, however, that contract negotiations were made much easier because of the existence of the Agricultural Labor Project over the past two years.

2) Approximately one-half of all agricultural employees of the Company are "Regular" employees (permanent and full-time) and the other half are "Seasonal" employees (full-time work available approximately seven months of the year). Prior to the union contract, both groups were accorded substantial

"employment benefits" by the Company; however, additional and improved benefits were provided as a result of the contract.

3) The more significant benefits under the Agricultural Labor Project and the contract for "Regular" employees are:

- Group life insurance coverage
- Group medical insurance coverage
- Retirement Plan
- Thrift Plan (savings and bonus)
- Tuition Refund Plan (education and training)
- Travel Accident Plan
- Formal Grievance Procedure
- Assured weekly hours of work
- Stand-by Pay (in the event of bus breakdown)
- Paid Sick Leave
- Jury Duty Pay
- Funeral Leave Pay
- Paid Vacations
- Paid Holidays
- Workman's Compensation Make-up Pay
- Field Toilets, iced drinking water, tools and equipment, safety programs, etc.

4) The following benefits are provided under the Agricultural Labor Project and the contract to <u>all</u> "Seasonal" employees:

- Group life insurance coverage
- Group medical insurance coverage
- Travel Accident Plan
- Formal Grievance Procedure
- Stand-by Pay (in the event of bus breakdown)
- Jury Duty Pay
- Field Toilets, iced drinking water, tools and equipment, safety programs, etc.

(In the event a seasonal employee works 100 days or more in a calendar year - which just about anyone can do if he chooses, he is also provided):

- Paid Sick Leave
- Paid Vacations
- Paid Holidays
- Workman's Compensation Make-up Pay

5) Individual employee earnings have substantially increased so far in 1972.

- The average employee earnings for production (hourly-paid) employees (who worked 20 weeks and 1,000 hours or more) for the first six months of 1972 was $3,149. This covered 215 employees, and compared to $2,787 average income for employees in the same category for the first six months of 1971, up 13%.

- The average employee earnings for harvesting (piece-rate paid) employees (who worked 100 days or more) for the first six months of 1972 was $3,649. This covered 363 employees, and compared to $2,649 average income for employees in the same category for the first six months of 1971, up 38%.

II. In the area of housing, the following objectives and/or activities have been accomplished:

1) Forty of the 85 two-to-four bedroom, landscaped homes in Lakeview Park have been occupied. Thirteen of these families work for companies other than The Coca-Cola Company Foods Division.

2) Fifty of the 85 homes have been completed and it is anticipated that the remainder will be completed in the near future.

3) In addition to the families already living in Lakeview Park, at present seven other loans have been approved with thirteen more in process with FHA for a total of 60 homes signed and/or sold.

4) The tot lots, community walkways, beach pavilion, basketball court, children's playground equipment and parking lot for buses and trucks have all been completed and turned over to the Home Owners Association.

5) As Company-owned housing is being phased out in other areas, seven families have moved into new homes and thirty-six other families are in the process of buying new homes through FHA or FmHA qualified home builders in the communities where each family has chosen to live. Two other families are building their own houses. Company consultants are working with these people.

6) In July of 1970, the Company provided housing to 247 families. In keeping with the project objective of phasing out Company-owned housing, only 101 families remained in such housing. Of the 101, only 37 are scheduled to vacate Company-owned houses as the remainder will permanently live on premises for operational or security reasons. Of the 37, all but

one have plans at this time to buy or build their own homes.

III. In the area of health, education and social services, the following objectives and/or activities have been accomplished:

A. The Avon Park-Frostproof-Wauchula Community Development Corporation

1) Renovation of facilities to house the Living-Learning-Library Center, the Child Development Center and the Community Health Clinic, at the Frostproof complex has been completed.

2) The Living-Learning-Library Center is fully operational with a staff of six. Three of these are library aides hired from the community who will gain the necessary job skills through special on-the-job training programs. Funding for this program is provided to the Board by a grant under the Library Services and Construction Act with additional local funds provided through the Company. A summer youth recreational/educational program involving some 65 children from the surrounding communities is in operation during the summer school vacation period of June - August.

3) The Child Development Center serves 40 - 45 children between the ages of six months to six years, five days a week. The Center is open from 6:00 a.m. to 6:00 p.m. due to the work schedules of their mothers.

4) The medical screening and referral program has held pre-screening interviews with 565 persons living in the area served by this board. Of this group, 407 persons completed their medical history forms with 362 voluntarily agreeing to a medical examination by a physician. Of those taking the medical examination:

38.9% had major illnesses
25.1% had minor illnesses
53.0% had multi-dental caries

Those persons with major and minor illnesses are involved in appropriate referral and follow-up medical care.

5) On July 1, 1972, this board received, as an interim grantee, a three-year grant to provide comprehensive medical and dental care for migrants and other needy families in this area. The grant of $169,878 per year is funded by the U.S. Department of Health, Education and Welfare. The program will be located at the Frostproof complex where existing structures will be appropriately renovated. The clinic will provide at least one doctor and dentist plus support staff such as nurses, dental aides, clinic aides and community health workers. It is expected that the National Health Service Corps will provide the dentist. The program will provide care for acute and chronic medical conditions, health and nutritional education and acute and preventive dental care. Clinic aides and community

health workers at the clinic will be hired and trained from among the agricultural worker population in the area.

6) The once-a-month training sessions for board members and other interested community persons is scheduled through the end of the year. Other educational programs involving adult education classes, vocational training at local schools and college continue as previously reported.

B. The Fort Pierce/Indiantown Community Development Corporation

1) Final rezoning approvals given by the County Commissioners should result very soon in the purchase of 1.6 acres of land on which a community complex will be built in Fort Pierce. The complex will house a child development center, the community offices and meeting room, the community health aides, library and recreational facilities. The building is anticipated to be completed early this Fall. The land and building will be provided by the Company to the board through a lease agreement for one dollar per year.

2) The medical screening and referral program has been initiated in the area with the hiring of two community health aides who will participate in a four-week intensive training program to gain the necessary skills before making their first family visits in late August. The program, under the direct supervision of an accredited Public

Health Nurse, will be made available to each Company employee and each member of his or her family who lives in the Fort Pierce/Indiantown area. Complete medical histories for each individual will be recorded by the community health aides followed by a physical exam by a physician. Appropriate referral and follow-up procedures will be given to individuals with problems identified in the screening program. The first families to be served will be in the Indiantown area.

3) The Child Development Center in Indiantown closed for two weeks in July for staff vacations and minor renovation. It re-opened July 31 with an all-day family orientation program for the community on July 29.

   The Child Development Center in Fort Pierce is anticipated to open early in the Fall at the new community complex. Thirty-six prospective employees from the agricultural community have been attending classes daily for six weeks at the Indian River Community College gaining new educational skills in preparation for these new jobs. They will receive further on-the job training at other local child development centers and further classroom work prior to the opening of their own center in October.

4) Educational classes in legal rights, basic adult education and vocational training have been well attended in recent months.

C. Central Region Community Development Corporation

1) The board has received its charter from the State of Florida on May 12, 1972, making it the third community development corporation to receive its charter as a result of the project.

2) The board is acting as a catalyst between members of its community who need off-season jobs and Walt Disney World. The board, through a lease arrangement with the Company for two buses, will make transportation available to those members of its community who apply for and receive jobs at Walt Disney World during the harvesting off-season (July - October). Close cooperation between the personnel offices at Walt Disney World and the board have made it possible to schedule interested employees on two work shifts so that they might ride in large groups on the buses. The buses will operate seven days a week to accommodate the needs of all employees due to different work week schedules and overtime requirements.

3) An adult basic education "tutoring" program has been in successful operation for over two months. The tutor (a college student with special orientation for this program) goes to the home of the persons who desire special tutoring help in basic adult education for one hour each night, one or two nights per week. Each person being tutored receives lessons especially prepared for him according to

his educational needs. This special tutoring program has been so well received that additional tutors have been hired so that all persons requesting a tutor could be accommodated.

4) The once-a-month training session for all board members continues. These training activities deal with the responsibilities of being a board member and how to appropriately deal with problems confronting the board as it manages the programs for all members of the community it serves.

5) A youth group has been organized and is currently exploring the activities and programs of special interest to the group.

6) The board held its first annual meeting in April, where new board members were elected by secret written ballot. The meeting was well attended by families from the community and a number of visitors, including members of the Fort Pierce/Indiantown and Avon Park-Frostproof-Wauchula Community Development Corporations.

IV. In the area of organizational development, seminars were held on May 22 and 23 for all harvesting foremen and supervisors. A similar seminar was held on June 27 for all production superintendents and foremen. These seminars, dealing with personnel policies and practices and with employee supervision, are part of a continuing program begun early in the project.

V. In the area of community relations, the project is continuing its ongoing documentation and public information activities described in previous reports.

State and Federal Rights of Migrant Farm Workers: An Appraisal

Mark Erenburg
Research Fellow
Department of Economics
University of Wisconsin

February 1, 1967

THE GOVERNOR'S COMMISSION ON HUMAN RIGHTS
902 State Office Building
1 West Wilson Street
Madison, Wisconsin 53702

Telephone: 266-1231

(The opinions expressed in this paper are those of the author and do not necessarily express the opinions of the Governor's Commission on Human Rights)

It is the purpose of this paper to clearly set forth the legal position of migrant farm workers in this country and in Wisconsin, to comment upon the degree to which the legal rights of these workers are recognized, and to suggest courses of action which would insure the migrants a more complete realization of these rights. The paper begins with a discussion of the federal laws and programs which apply to migrant farm workers, proceeds to an analysis of the legal position of migrants in Wisconsin, and concludes with comments on the future status of migrant workers in the United States.

I. FEDERAL LAWS AND PROGRAMS

1. The Social Security Act - Old Age, Survivors, and Disability Insurance

The Social Security Act covers agricultural employees who are paid $150 or more in cash during a calendar year by an employer, or who have worked for an employer on 20 or more days during a calendar year for cash-pay on a time basis.[1] Farm crew workers are employees of the crew leader if the crew leader (a) arranges with the farm operator to furnish workers; (b) pays the workers either on his own behalf or on behalf of the farm operator; and (c) is not designated as the farm operator's employee in a written agreement between himself and the farm operator. The crew leader in this case is considered self-employed and is responsible for the payment of employment taxes and for reporting the workers for Social Security purposes. If an agreement has been entered into in writing that the crew leader is the farm operator's employee, all his crew members are also employees of the farm operator. If the crew leader does not pay the workers or has not entered into a written agreement as above, the common-law test is applied in

determining the identity of the employer of the workers and the status of the crew leader.[2]

A number of factors prevent migrant farm workers from receiving the protection of the Social Security Act: Many workers do not earn as much as $150 from an employer in a calendar year or work 20 or more days for an employer on a time basis; uncertainty of whether the farmer, the crew leader, or the migrant himself is an "employer" has produced widespread controversy, and consequently no consistency in regard to who, if anyone, deducts and matches Social Security contributions for farm workers; where crew leaders are indeed employers of farm workers, there is no enforcement of Social Security regulations; and where farm workers work in family units and earnings are recorded as family earnings, accounts of individual family members cannot be credited with their individual earnings, and usually no one receives proper credit for the work performed.

To bring farm workers under the Social Security Act, the standards of the law should be lowered to include those workers who earn $50 (not $150) or more from an employer in a calendar year. The Social Security Administration and the Internal Revenue Service (the collector of the Social Security Tax) should reformulate specific administrative rules governing work in agriculture. For example, amend Chapter 7, Title 42, sec. 410 of the Social Security Act[3] to read: Where doubt exists as to who is the employer of a given employee, the decision shall turn on who pays for the work done, whether by the hour or by any form of piece rate or share basis. In situations where the crew leader is considered the employer, evidence of deduction and matching of Social Security contributions should be made a prerequisite for registration under the

Farm Labor Contractor Registration Act of 1963.[4] Finally, where individuals work in agriculture in family groups and are paid by any form of piece rate or share basis for the services performed, the earnings of the family group should be regarded as the earnings of the designated family head for taxing and crediting purposes.

2. The Farm Labor Contractor Registration Act of 1963

The Farm Labor Contractor Registration Act of 1963 is designed to prevent the exploitation of migrant agricultural workers by farm labor contractors.[5] The act requires a farm labor contractor (crew leader) to obtain a certificate of registration from the U. S. Secretary of Labor, if the crew includes 10 or more migrant workers who will be used in interstate agricultural employment. The act prescribes certain duties for the contractor, lists certain undesirable practices which are prohibited, and provides machinery for refusing or revoking a certificate of registration.

Although this law does provide for supervision of crew leader behavior, greater safety in the transportation of farm labor, and access to labor market information from crew leaders, its primary impact in the Midwest is lost because Midwest migrants do not regularly suffer from the exploitation prevalent on the East and West coasts. In the Midwest, crew leaders are usually paid a salary, a bonus on the crop harvested by their crews, or both to compensate them for their organizational and transportation services. Only rarely does a Midwest crew leader receive total payment for his crew's work, take a percentage for himself, and then distribute the remainder to the crew, not telling them about his percentage. Workers are usually paid directly by farmers or

processing companies as are the crew leaders. Because the cost of crew leader services is such a small percentage of total labor costs for an employer, the crew leader does not even indirectly lower the potential earnings of his crew. It is to the advantage of the crew leader to seek greater efficiency from his crew, since he will usually derive a bonus from their productivity.

Regulation of exploitation by crew leaders in the Midwest is not needed. However, enforcement of this law should not be allowed to wane even when its main purpose is already served. As mentioned above, the law can certainly contribute to the safety of workers in transit (the law provides the basis for, among other protections, compulsory automobile liability insurance and safety standards for vehicles),[6] can discourage nefarious activities, and can contribute to a better understanding of the farm labor market. Data gathered in compliance with this statute must be made available to the public in its most complete form without delay. Only through increased knowledge can a comprehensive picture of the supply and demand for farm labor and a better utilization of resources be developed.

3. <u>The Fair Labor Standards Act - Minimum Wage for Agriculture</u>

The 89th Congress amended the Fair Labor Standards Act to bring certain agricultural employers under minimum wage regulation. Any employer employing 500 or more man-days of agricultural labor in any calendar quarter of the preceding year is subject to minimum wage regulations.[7] The federal minimum wage for agriculture now prevailing is $1.00 per hour.

There is no way to assess the extent of the impact of this legislation on the migrant worker, both because there is no way to determine

how many migrant workers would come under the law and because there is no way of estimating the degree of enforcement of the new amendment. Congress did intend that employees of only large farms be covered, and while the number of such large farms is increasing, it is safe to say that a large number of migrant workers are employed on farms where less than the equivalent of seven full-time workers are employed for a quarter of a year.[8] Needless to say, there will be enforcement difficulties too, which cannot be assessed here. But, remembering that agriculture has always demanded and obtained special exemptions from federal legislation, and that the agricultural industry is characterized by the fierce independent spirit of the small farmer, we can see that enforcement of the federal minimum wage for farm labor and especially for migrant farm workers will be difficult. It is now too early to tell what difficulties and/or benefits will come from this legislation, but not too early to seek wider coverage and stronger mechanisms for the enforcement of a federal minimum wage for agriculture.

4. The Fair Labor Standards Act - Child Labor

Farmers whose crops or products go either directly or indirectly into interstate or foreign commerce are subject to the child labor requirements of the Fair Labor Standards Act. That is: Farmers may not employ children under 16 years of age in agriculture during school hours.[9] Farmers must also keep certain records required by regulations under the act regarding the minors they employ.[10] These requirements apply to the employment of migratory children as well as local resident children.

The law is a wonderful instrument. Coupled with the state laws governing compulsory education (as the Wisconsin law discussed below),

the Fair Labor Standards Act provides a strong base for the protection of minor children in their employment relations. However, no matter how good the law is, its effectiveness depends ultimately on its enforcement. The enforcement has been far from adequate. The Wage-Hour division of the Department of Labor has far too few staff members dealing with far too many migrant families to effectively enforce the law. The budgetary limitations which are now preventing this division from fulfilling its duties should be eliminated. With an adequate number of officials, and with the cooperation of state officials (which also must be nurtured), the enforcement of the Fair Labor Standards Act will become more effective. Efforts should be directed toward improving the enforcement, not the substance of this federal act.

5. The Economic Opportunity Act of 1964

There are several sections of the Economic Opportunity Act which are directly applicable to migrant workers.[11] One is Title IIIb which deals with migrants directly,[12] another is Title IIb which deals with vocational and adult education,[13] and of course, Title IIa, the C.A.P. program.[14] Several comments must be made on the use to which this legislation is being put.

First, as with all retraining and adult education programs, OEO programs for migrants suffer because only the cream of the migrant population is exposed to such education, while the people who most need help get none. This problem cannot be easily remedied and in fact, no productive approach suggests itself.

Second, too many OEO migrant projects are hampered by bureaucracy and are oriented toward "Anglo" rather than migrant world view. In some

projects, there are not enough migrant participants or consultants on the administrative or field staffs to allow the programs to effectively serve the target groups which they purport to serve. In some projects, the migrant staff members are hampered by excessive regulation, supervision, and red tape so they cannot be effective contributors to the effort. In other projects, migrant staff members are hired merely as window-dressing; to appease the social thinkers. In such migrant projects, the basic purpose of the Economic Opportunity Act is flaunted.

Third is the more general matter of the availability of funds. The prospect of a diminution of the funds available for poverty programs and for migrants in particular is deplorable. Interested citizens should stand firm against any such politically expedient move by the present administration.

6. The Migrant Health Act of 1962

The purpose of this act, passed in 1962, is to expand services to improve health care and health conditions for domestic agricultural migratory workers and their families.[15] The act has two main provisions. The first authorizes the Public Health Service, U. S. Department of Health, Education, and Welfare, to make grants to public and other nonprofit agencies to pay part of the cost of establishing and operating family health service clinics, and other special projects to improve health services and conditions of domestic agricultural migratory workers and their families. The second provision authorizes the Public Health Service to encourage and cooperate in programs for the purpose of improving migrant health services and conditions. An expanded demand for these funds can only bring improvements for migrant workers and their families.

Such a demand must be cultivated by public and private social planners.

7. The Interstate Commerce Act

Federal law provides for the regulation of interstate transportation of migratory farm workers by certain motor vehicle carriers.[16] The Interstate Commerce Commission is authorized to establish reasonable requirements with respect to the comfort of passengers, qualifications of operators of the vehicles, and the safety of operation and equipment. Such requirements apply to carriers in the case of transportation of migratory workers for a total distance of more than seventy-five miles, and if such transportation is across the border of any state.[17]

Regulations under this law, issued by the Commission, list qualifications of drivers of vehicles transporting migratory workers, including physical fitness and minimum age of 21, and they place a limitation on the drivers' hours of work. They also require protection of passengers from cold; meal stops at least every six hours; and rest stops. In addition, the regulations include requirements as to the vehicles; they must have side walls and handles, seats with back rests, and smooth floors.[18]

There is generally inadequate enforcement of the provisions of the trucking regulations applicable to migratory workers. In fact, few migrants are aware of them. The problem is primarily one of inadequate staffing. There is some cooperation with state officers in states that have state trucking laws applicable to migratory workers. However, only a few states have such laws. The possibility exists that both federal and state trucking regulations can be more strictly enforced in the future if they can be administered in conjunction with the crew

leader registration law.[19] It may be possible to check drivers' equipment and trucks when crew leaders apply for their licenses. However, this will be far from a complete solution to the problem because the regulations are not limited to crew leaders, but also apply to family cars, station wagons, or trucks owned by families transporting migrant workers throughout the country. Speculatively, as the crew leaders are subject to more and more regulation, there may be a move toward the use of public transportation, expanded use of family cars, or the use of trucks to transport migrants to and from the fields only, relying on the migrants' family cars to get them to the harvest areas. If such a shift occurs, enforcement problems will surely multiply.

II. STATE LAWS AND PROGRAMS

1. The Wisconsin State Employment Service

The Wisconsin State Employment Service (WSES) should provide labor market information and related counseling and training services to migratory farm workers. In conjunction with employment services (or commissions or bureaus of employment security) in other states, the WSES processes clearing orders, directing the flow of migratory workers from areas of excess labor supply to areas of excess labor demand. This Annual Worker Plan is the largest single service the nation's public employment services perform. In Wisconsin, because of a lack of staff and because of the "local-interest" orientation of the existing staff, the service does not carry its clearing function to a logical end.

The WSES does not efficiently locate and relocate the migrant workers within the state as labor demand shifts. They provide little or no information about labor and crop conditions within the state or in

neighboring states. Local officials have little concept of the professional manpower policies of the WSES and the other state employment services cooperating in the United States Employment Service. They are concerned primarily with the labor problems of their local area and think secondly about the state as a whole and least about national labor problems; each successive step encompassing more the problems of migratory farm workers in relation to those of their employers.

The WSES does not communicate with migratory workers in Wisconsin. Wisconsin migrants are almost 100% Mexican-Americans but the WSES has no one on its field staff who speaks Spanish. WSES staff does not go to the workers, asking to be of assistance, or offering information. They await the visit of the worker to the office so he can ask questions in English (his second language) which might make him appear ignorant.

The function of clearing labor orders from states or areas of excessive supply to areas of excessive demand is one of the most important to the welfare of migrant farm workers. The WSES should continue its work with all diligence. However, the placement of workers once they have arrived in Wisconsin, and the movement of workers out of Wisconsin when another state's labor demand is more serious is equally important to the welfare of migratory workers. The WSES and its counterparts in other states should consider hiring field personnel who can most effectively communicate with the workers who pass through their states, hiring personnel who can conceive of labor problems on a state-wide and country-wide basis, and who will actively carry out the function of labor market intermediaries to efficiently distribute the country's labor resources to provide the greatest good for the greatest number of people.

2. Workmen's Compensation Insurance

Wisconsin passed one of the first Workmen's Compensation Insurance statutes in the United States in 1911.[20] In 1961 the statute was amended to cover agricultural employment on those farms where six or more workers are employed for 20 or more days in a calendar year.[21] For all intents and purposes, this revised statute covers the great majority of migratory farm workers who pass through Wisconsin each year.

A problem arises with the enforcement of this statute. The statute requires that covered employers post notices with certain information relating to industrial injuries.[22] Only recently have efforts been made to have these and other notices reproduced in Spanish where Mexican-Americans are likely to be employed.

Enforcement problems will not be eliminated with the continued introduction of Spanish language literature for migrant workers. Many workers can read neither Spanish nor English, and many more do not even understand the principles behind a Workmen's Compensation Insurance statute. The Industrial Commission should introduce a completely revised informational and educational program to better orient Mexican-American migrant workers toward the industrial-like environment in which they work. Other states, both industrial and agricultural should amend their Workmen's Compensation Insurance laws to include agriculture as in Wisconsin, and other states should make every effort to better educate and inform migrant farm workers about the ramifications of an industrial work environment.

3. The Migrant Housing Code of the State Board of Health

Chapter H 76 of the Wisconsin Administrative Code sets forth the minimum standards adopted by the State Board of Health applicable to all

migrant labor camps. The chapter is known as the Migrant Housing Code. A survey conducted by the Wisconsin Governor's Committee on Migratory Labor has revealed that this code is surpassed only by the Michigan code as the most rigorous and inclusive housing code of all the states which experience a substantial influx of migrant labor.[23]

The problem with this code is not in its substance, but in its enforcement. The State Board of Health does not have sufficient staff to conscientiously inspect and reinspect the over 330 camps in this state. The Board also has limited powers for enforcing their orders for closing and for repair of camps. Administrative channels between the Board and the Attorney General's office are clogged with tradition and strangled by a lack of funds. The Board has already applied for additional funds for inspectors and legal aid in enforcement. Some improvement may be forthcoming.

Other migrant-using states should enact and/or revise their housing codes to conform with the Wisconsin and Michigan standards, but even more important, all states should embark on a program of increased inspection and supervision of the housing facilities provided for migrant labor.

4. The Wisconsin Minimum Wage Law

Section 104.01(1) of the Wisconsin Statutes of 1965 reads: "The term 'employer' shall mean and include every person, firm or corporation, agent, manager, representative, contractor, subcontractor or principal, or other person having control or direction of any person employed at any labor or responsible directly or indirectly for the wages of another." There is no agricultural exemption in the Wisconsin Minimum Wage Law, but because its constitutionality was in doubt when the law was first passed,

it applies to women and minor employees only. The prevailing minimum wage in Wisconsin as of February 1, 1967 is $1.25 per hour for women and minors 18 years of age and over as set by the Industrial Commission.[24]

The Commission is also responsible, through its Labor Standards Division, for the enforcement of this law. In one respect, the Commission has managed to circumvent the difficulties imposed by the exclusion of men from the law. After examining the Wisconsin Fair Employment statute,[25] the Commission feels that to discriminate against men by paying them less per hour than women for comparable work is a violation of the law. A novel approach, but as yet untested by the courts.

The Commission, however, has failed in its primary task of satisfactorily applying the Wisconsin law to migrant women and children. There have been difficulties, to be sure, but the Commission's efforts have been small. Granted, it is difficult to convert piece-rate wages into hourly equivalents without extensive supervision and records of hours worked kept by employers. Granted, work in family units does not lend itself to computation of minima for each individual worker. But, these difficulties have to be surmounted since the law does not exclude agricultural employment. The Commission must use every resource at its disposal to make the law effective. Ideally, the legislature should pass a minimum wage law which covers men and women because only with such a law can Wisconsin claim complete protection for the socially disadvantaged workers of the state. For the present, the Commission must work with agricultural interests to devise a reporting and auditing procedure which will insure women and children in agriculture a "living wage."

As already noted, the federal minimum wage for agriculture probably will not cover many migrant workers. The Wisconsin wage is not being applied effectively to migrant workers. Other states do not have minimum wage laws or do not apply them to agriculture. Ideally, improvements should alter federal and state legislation and enforcement so that all farm workers may enjoy the social minima enjoyed by the industrial workers in this country.

5. The Wisconsin Child Labor Law

With the power granted by the Wisconsin Statutes,[26] the Industrial Commission issued a child labor rule in 1960 which reads in part: "No minor under 12 years of age may be employed or permitted to work ... in cherry orchards, market gardening, gardening conducted or controlled by canning companies and the culture of sugar beets and cranberries. (1) The presence of a child under 12 at the place where his parent or guardian is employed, if merely for the purpose of supervision, is not prohibited by this order, and (2) An employer is not deemed to have permitted a child to work at employment prohibited by this order if he has notified his employees of its provisions and has made reasonable effort to enforce such provisions and has not acquiesced in children under 12 performing such work."[27]

Wisconsin is one of the few states which regulates child labor in agriculture. It is a shame that this order is not enforced. There is difficulty in determining the ages of migrant children, and there is difficulty in keeping enough staff in the field to insure observation of the law. By instituting a system of child labor permits in agriculture as in industry, and by increasing the field staff of the Labor Standards

Division, this child labor order could effectively be implemented. In addition, the order should be reworded to eliminate the loopholes now present in subsections (1) and (2).[28]

6. The Compulsory School Attendance Law

The Wisconsin Department of Public Instruction is charged with enforcing the state's Compulsory School Attendance Law which provides (by 1970) that children between the ages of 7 and 18 (with special provisions for vocational education for children above 16) must attend school while it is in session.[29] The law does not discriminate between residents and non-residents of the state. That is, if a child of the proper age is in the state while school is in session, that child must attend, no matter where his permanent residence. The application of this law presents certain problems.

Many school districts cannot afford the temporary influx of migrant children in the spring and fall. Many cannot provide the bilingual teachers, the classroom space, the desks, books, and recreation facilities necessary for the proper education of an increased number of students. Naturally, many local districts are hesitant to bring migrant children into the system because it would only mean a lowering of the educational standards for the local children while the migrants were in the area. In other cases, there is a lack of employer cooperation in implementing the law where school districts do want to follow the dictates of the law. There are also problems of parental education, a lack of communication between home and school, a lack of study time, space and incentive in migrant camps, and the gross financial problems of migrant families. The Department of Public Instruction tries to give special assistance to those

districts which are centers of migrant concentration, but a lack of funds and staff has made their job difficult. This Department should exert all pressure on local districts to comply with the state school law and urge that it seek, anew, funds to aid migrant education.

7. The Department of Public Welfare

The Wisconsin Department of Public Welfare is equipped to serve migrants in two general ways. First, the Department administers a state-at-large fund to reimburse local welfare districts for general relief and emergency medical payment made to non-residents.[30] The law provides up to 30 days of general relief for persons who do not have a legal settlement within this state and who have resided in the state less than one year, and provides for independent payment of emergency medical expenses for these people. A fear by local administrators that they will be unable to prove that migrants are non-residents, a lack of knowledge of the program by the migrants, and a confusing mixture of county and local welfare administrations present the biggest hurdles to an effective use of this public welfare program. To remedy the situation, welfare information should be more readily made available to migrants in Wisconsin, tests for eligibility should be revised and simplified, and an appeals procedure to state officials should be instituted to remove any final decision about allocation of welfare funds from the myriad different local administrators.

Wisconsin also provides medical assistance to minors under Title XIX of the Social Security Act, and to certain adults, given revised and liberalized eligibility requirements.[31] The program is too new to be evaluated properly, but one obvious comment is that it will not be

effective for migrants unless the ramifications of the program can adequately be explained to the migrant population.

Secondly, the Department of Public Welfare, Division for Children and Youth (DCY) provides Day Care centers for migrant children aged 3 to 7 during summer months. These centers are designed to encourage a social and intellectual growth of preschool children. The centers have been in existence since the summer of 1962 and serve a valuable function as the first exposure to a school environment for young migrant children. It is hoped that DCY will continue to supply funds and personnel to run these centers and that they will increase their advertising and promotion activities to bring more eligible migrant children into the program.

8. The Proposed Labor Recruiter Registration Law

Several states, including Minnesota, Michigan, and Texas now have laws requiring labor recruiters to register with the local employment services.[32] The laws are supposed to prevent labor pirating and the misinforming of the migrant labor force. Such a bill was introduced in the 1965 session of the Wisconsin legislature. The bill never reached the floor.[33]

Comment upon this legislature is called for. The state of Wisconsin should never adopt such a law. Setting aside the possibility that Constitutional rights of free speech may be violated by such a registration law, the functioning of the labor market and the purpose of the State Employment Service should serve to preclude the need for such a law. The Employment Service provides labor market information about jobs and wage rates to agricultural workers as one of its most important jobs. This purpose is not aided by preventing information from reaching workers

independently through word of mouth, or through labor recruiters from other areas. If wages are higher, or conditions better in another state, then that information should be given to the workers either by the Employment Service, word of mouth, labor recruiters, or some combination thereof. No attempt should be made to regulate the introduction of this information. If this state fears the loss of labor before its own crops are harvested, then the agricultural industry should be prepared to match wages and conditions offered by other areas in active competition for labor. There is no a priori reason for believing that once labor comes into a state, that labor should be insulated from all other labor market information until the crops of that state are harvested. This type of thinking leads to a misallocation of resources and lower total earnings for agricultural workers.

To the proposition that the regulation of labor recruiters would prevent misleading and often false information from reaching the migrant workers, the reader should recognize that the market system can and must deal with these problems itself. Workers who are misled, will not often be misled again. To combat the risk of labor loss because of misinformation, employers should be made to bear the cost of wages higher than minimum to keep a stable labor force. If the state government is to do anything to change the labor market mechanism, it must provide reliable information to all who seek it, instead of trying to screen out information which can be used by workers to maximize their total earnings and to bring about a more optimal allocation of resources in the state and in the country.

9. Unemployment Compensation Insurance

Migrants in Wisconsin are not eligible for Unemployment Compensation

Insurance in agricultural employment.[34] The Unemployment Compensation concept places the responsibility for employment fluctuations upon the employer, rewarding him for keeping his own employment stable. Obviously, agricultural employers cannot readily control the fluctuations in their demand for labor and should not be required to bear the cost of such fluctuations. Thus, the Unemployment Compensation Insurance System of the State of Wisconsin as it is formulated should not be adapted to better serve the migrant farm worker unless the philosophies behind the law are first changed.

III. THE FUTURE OF THE MIGRANT WORKER

1. Collective Bargaining

When passed in 1935, the Wagner Act insured industrial employees the right to organize and bargain collectively with employers as to matters of wages, hours, and working conditions.[35] The law provided an administrative agency, the National Labor Relations Board (NLRB) to oversee the application of the law; to determine appropriate bargaining units, to hold elections, to certify exclusive bargaining representatives, and to investigate unfair labor practices on the part of the employers and later the employees.[36] The basis for the law and the power granted to the NLRB as decided in the famous Shechter case and as stated in the act itself is the prevention of the disruption of interstate commerce by the actions of employers and employees in labor disputes.[37]

The agricultural industry today is at the stage of development which the manufacturing industries held in the 1930's. Labor unrest is interfering with interstate commerce. The industry has developed a structure which allows the development of unions of farm workers to bargain with a

relatively small number of employers about wages, hours, and conditions of employment. The industry is no longer composed of myriad independent small farmers and a larger number of uninformed and uneducated farm workers. Today, "agri-business" has large farmers and a more informed, more educated, and more structured force of farm workers.

The traditional reasons for excluding agriculture from coverage by the National Labor Relations Act -- the large number of uneducated workers, the large number of diversified employers, the vital nature of the industry, its inability to be efficiently controlled, and unfamiliarity with government regulations -- are gone. The threat of damage to our economy due to interference with interstate commerce in the agricultural industry has grown. The industry is gaining structure and organization much like any other manufacturing industry. Is it not time to reconsider the implications of taking agriculture under the NLRA? Why should governmental employees be given collective bargaining rights when they once were vehemently denied on grounds much more firm than those used to deny rights to agricultural employees? Why should agricultural workers not enjoy the same collective rights as industrial workers did in a similar stage of development?

The State of Wisconsin, as it has done in other fields, lead the country in adopting a state labor relations law in 1939 which did not exclude agriculture.[38] In 1964 and again in 1966, the Wisconsin Employment Relations Board considered cases arising out of collective bargaining in agriculture with the same efficiency and results as are experienced with more traditional industry problems.[39] In the 1966 case, the WERB considered a case which was denied jurisdiction by the NLRB because of agricultural status, and subsequently issued a cease and desist order in favor of

the agricultural union. The jurisdiction of the state Board was not contended by the employer. Considering this state history, there can be little doubt that the National Labor Relations Act is not being adapted to the changing employer-employee relationships which exist in the country today, and is losing its effectiveness as a viable instrument for preventing labor unrest and the resulting damage to the economic system. Congress must reconsider the place of "agri-business" in the structure of the economy and act accordingly to rectify the injustices visited upon this industry's employees because of their exclusion from coverage by the National Labor Relations Act.

2. The Importation of Mexican Nationals

In 1964, Congress refused to renew Public Law 78, the Bracero program.[40] The reason given for this action was that the importation of Mexican Nationals tended to undercut the wages and employment conditions of American citizens and served to perpetuate the pockets of unemployment throughout the country. Congress felt that the work done by Mexican workers could and should be done by Americans to alleviate the unemployment problems of some agricultural and urban areas, and to add to the national product of the country as well as to the well-being of the employed workers themselves.

The Immigration and Nationality Act of 1952 (Public Law 414) provides another means for foreign workers to obtain six-month or longer permits to work in the United States.[41] On December 19, 1964 Secretary of Labor W. Willard Wirtz issued a statement in which he described the program to be followed by the Department of Labor in matters concerning Public Law 414 and the importation of Mexican Nationals. Wirtz said: "First, there will be no administrative extension of the situation existing under Public Law No. 78. Second, the responsibilities of the Secretary of Labor

under Public Law No. 414 will be strictly administered in accordance with the Regulations which are being issued today.... Third, an active domestic labor recruitment program has been instituted and must be continued." (Emphasis in original.)[42]

The Secretary must carry out his promises. There has been an administrative extension of Public Law No. 78--witness the use of "greencard" Mexican Nationals to break the strike of farm workers in the Rio Grande valley of Texas. Does the Secretary of Labor believe that a labor shortage has been demonstrated by employers there because workers are out on strike? Is the Secretary strictly enforcing his Regulations under Public Law No. 414 or are local authorities warping the national interests to conform with the interests of local farm owners in predominately farm states such as Texas? Where is the active domestic labor recruitment program and what has it done? The Secretary has reported that the end of the Bracero program had little or no effect on prices of agricultural produce.[43] No wonder, with the supply of workers coming into the United States through the holes in Public Law No. 414, why should there be any impact? Every effort should be made to end Public Law No. 78 de facto just as Congress ended it de jure in 1964.

In conclusion, the federal and state programs serving migrant workers seem adequate in substance, but are lacking the enforcement needed to reach desirable social goals. This is not true in every case, but on the whole, the statement stands. In the future, the substance of all programs will have to change to meet the changing needs of the migrants, and new programs such as one to insure collective bargaining rights will have to be implemented so that migrants can be successfully integrated into an industrial and somewhat alien society.

Texas farm workers' struggle heard by Senate committee

RIO GRANDE CITY, TEXAS—

Thunderclap from a Senate hearing a week ago brought water to the parched earth of south Texas where miserably paid farm workers have been on strike against million dollar fruit and vegetable farm corporations.

The power and glamour of the United States Senate came to this grimly impoverished Texas land like a spectacular thunderstorm—complete with flashes of lightning, welcome rain, and a beautiful rainbow afterwards.

It was difficult to measure the political rainfall because the gullies were gushing with water that washed away the lizards and cactus, and

"FARM WORKERS' STRIKES & BOYCOTTS"
CONTINUING STRUGGLE FOR SELF-DETERMINATION

The agricultural industry is putting together another major effort to stop the farm workers' union. As of this writing the leadership of the Teamsters Union has decided to join the employers in this effort.

The "growers" (meaning the decision-makers of the industry) have developed a four-fold strategy:

1) Attack the motives and efforts of Cesar Chavez and the United Farm Workers.
2) Resist all grass roots UFW organizing (by firing union members, refusing to negotiate, resisting renewal of contracts, denying access to union organizers).
3) Invite the Teamsters in when it is necessary to thwart United Farm Workers.
4) Divert attention from the moral issue of justice and dignity for farm workers by talking about the "jurisdictional dispute", "elections" and "reasonable legislation".

Cesar Chavez and the United Farm Workers intend to continue and strengthen their non-violent campaign. They will organize farm workers and ask for support from concerned people all over the world. Every person who reads this paper can help in the following simple ways :

a) Avoid all head (iceberg) lettuce and table grapes unless they bear the United Farm Workers' Aztec eagle label. Also avoid all Gallo and Franzia wines (all wines from Modesto, California are Gallo wines; all wines from Rippon, California are Franzia wines).
b) Offer to help your local boycott committee (325 Second Ave. S.E. Atlanta, Ga. 30317; 373-0201)

How did the lettuce strike get started? For years lettuce workers quietly organized local UFW committees and waited for the successful completion of the Delano grape strike. In July of 1970 as the grape struggle was ending, the United Farm Workers (UFW) petitioned lettuce growers for secret ballot union representation elections. The growers sought out the Teamsters Union and signed back door contracts. The workers were not consulted. Denied elections, they went on strike August 24, 1970 to demonstrate that they wanted to be represented by Cesar Chavez' UFW. 7,000 workers walked off the job in what the L.A. TIMES called: "The Largest Farm Labor Strike in the U.S. History." As a result of the strike several growers rescinded their contracts with the Teamsters, held elections, and negotiated contracts with the UFW. About 10% of the lettuce bears the UFW label.

What about the grapes and wines? On April 16, 1973 the majority of the Coachella Valley growers refused to renew contracts with the UFW, signing with the Teamsters Union instead. The Farm Workers immediately went on strike, and called for a renewal of the grape boycott. Later in the summer of 1973, grape growers in the San Joaquin Valley followed suit and signed with the Teamsters. The strikes spread, with increasing incidences of violence and intimidation by Teamster "goons". Unjust mass arrests of striking farm workers in all major grape growing areas brought many religious leaders to the picket lines; these supporters, in turn were arrested along with the farm workers. In August, one UFW striker was shot to death by a sniper; another died as the

result of injuries received at the hands of a deputy sheriff in Arvin, California. In August 1973 Cesar Chavez called off the Strikes, rather than risk further violence.

Why a boycott? For 100 years growers have broken strikes by intimidating local workers and importing strikebreakers and by enlisting the cooperation of local law enforcement officials who issue restrictive injunctions, enforce them aggressively and provide a police escort service for strikebreakers.

Workers in agriculture have had many strikes but their employers have been willing to accept limited losses rather than negotiate with their workers. In Salinas on September 17, 1970, a local judge outlawed all strike activity on the ground that the strike was a violation of California's Jurisdictional Strike Act. The workers chose to appeal that court decision and to continue their struggle through the lettuce boycott.

What was the outcome of the court appeal? On December 29, 1972, the California Supreme Court, in a 6-1 decision, overturned the 1970 injunction and ruled that the lettuce growers had unfairly interfered in union affairs by recognizing the Teamsters Union as the exclusive bargaining agent for the growers' lettuce workers when in fact neither the growers nor the Teamsters had consulted any farm workers.

Why is it important which union represents farm workers? The farm workers' struggle is for justice and self-determination. Farm workers are interested in more than higher wages. They want to participate in building a union of their own. They want leaders they trust. For these reasons they want Cesar Chavez and the UFW. They have demonstrated their clear preference for UFW in the great lettuce strike of 1970 and in the elections supervised by the Catholic Bishops Committee at Interharvest and at other lettuce ranches that have negotiated contracts with UFW. (There have been no representation elections of any kind at Teamsters ranches.)

A Lutheran clergyman whose father found dignity through the struggles of the UAW has written to the President of the Teamsters: "You are a busy man so let me come to the matter of central importance. Contract terms (benefits) have never been the primary reason to organize workers. Organizing has first to do with you consciousness of being a self-determined person, acting, rather than being acted upon, free, rather than oppressed. Cesar Chavez and the United Farm Workers aim at this primary goal. I don't get the impression that you do."

The issue is simple at its core; should farm workers have a union of their choice or should growers be able to pick a union and impose it on their workers?

The growers keep saying that they are for election and Chavez is not. Recent events should end that discussion! UFW and the lettuce workers wanted elections in 1970 and were refused. The growers signed contracts with the Teamsters without an consultation with workers (no strike, no secret ballot, no card check, no ratification). If growers are in favor of elections, why did they sign Teamsters contracts behind their workers backs?

The growers say that the farm workers' boycott is vicious and immoral! The British must have had similar feelings about the potent boycotts used by Sam Adams and other American patriots in the 1770's. The farm workers' boycott is an effective non-violent way for millions of concerned Americans to be with poor people in their struggle for justice. The boycott is a beautiful thing for the poor. It is hated because it is ecenomically effective. If the growers and the chain stores would stop fighting the farm workers union and use their influence to bring about more justice for farm workers then there would be no strikes and boycotts. It is the intransigence of the powerful that makes the boycott necessary. Dr. Martin Luther King Jr. used to say: "We are not boycotting to put anyone out of business; we are boycotting to put justice in business."

The Farm Bureau says that migrants are disappearing and that they represent only 10% of the farm labor force: There are 3 million farm workers in the USA according to a 1972 USDA paper entitled "The Hired Farm Working Force of 1971." The Senate Subcommittee on Migratory Labor in its 1969 report placed the migrant population in the country at one million. The USDA study found that the average migrant earns $1407 per year. 800,000 farm workers are children under 16 years of age; 300,000 of these children are migrant farm workers ("Child labor in Agriculture" American Friends Service Committee, 1971).

There are still hundreds of thousands of poverty stricken migrant farm workers. According to the U.S. Public Health Service the average life expectancy of migrants is 49 years. The nationwide average expenditure for migrant health in 1967 was $7.20 per person. For the U.S. population as a whole the figure was $256.00 (Research & Statistics, Note #7, 6/18/70, Social Security Admin. of the U.S. Dept. of H.E.W.)

In regard to lettuce, the growers talk about good wage if workers move with the harvest but forget they are proving that migrancy is necessary in the lettuce industry. The lettuce harvest moves geographically from Arizona to So. Calif. to Northern Calif. to Central California to Arizona. To even get close to 8-10 months of work a worker must migrate 4-6 times a year.

How important are wages to farm workers? Are other issues also important? Wages are very important because farm workers whowork under union contracts can now buy and rent their own homes and feed their own children instead of being dependent on charity. But wages are not as important as other issues that confront USA farmworkers:

1) Speed-ups, arbitrary firings, and personal abuse by foremen, supervisors and labor contractors. It is not uncommon for women to be degraded and their husbands humiliated by the personal attention of the "bosses." To resist is to be fired.
2) Lack of toilets and cool, clean drinking water in the fields.
3) Exploitation by labor contractors and crew leaders who overcharge for transportation, food, water, housing, loans, etc: who fail to pay Social Security to the government even after they have withheld it from the workers; who control the lives of their workers. The Teamsters' leadership and the lettuce growers are committed to continuing the labor contractor system. The UFW is just as determined to replace labor contractors with a union hiring hall.
4) A sense of futility and helplessness; without an enforced union contract farm workers have no grievance procedure, no way to protest mistreatment without risking their jobs -- so farmworkers silently swallow humiliatons in order to feed their children.

What are some of the benefits of the United Farm Workers' efforts?

1) Growing conviction that the poor can make changes through determined non-violent struggle.
2) Demonstration that Filipinos, Blacks, Whites, Chicanos, Arabs, Puerto Ricans and others can work together in one union.
3) Witness to the power of sacrifice and service on behalf of the oppressed: a challenge to all of us.
4) New hope among farm workers everywhere.
5) A new spirit of self-respect and independence that takes the place of fear and helplessness as farm workers organize, picket, build the boycott, form ranch committees, negotiate contracts and work in their own committees to enforce those contracts.
6) The Robert F. Kennedy pre-paid Medical Plan that has paid out two million dollars in benefits to farm workers and their families for: doctor visits, X-rays, lab work, medicine, maternity, surgery, hospital bills, death benefits, emergency dental care and ambulance service.
7) Farm Worker clinics (not government clinics or charity clinics) in Delano, Calexico, Fresno, and Salinas.
8) A Farm Workers' Credit Union controlled and administered by farm workers.
9) Agbayani Retirement Village for Filipino workers; now under construction in Delano.
10) Through the hiring hall an end to the labor contractor and crew leader system; an end to 4:00 A.M. "Shape-ups" where farm workers sell their bodies and their work to the highest bidder and climb into cattle cars to be taken to work; and an end to arbitrary firings, black-listing and discrimination in employment.
11) Job security for those farm workers who, after the age of 40, must still feed their children but who can no longer run through the fields with the youngest workers.
12) For farm workers, protection from poisonous pesticides in the fields; for the consumers, less poison on our food.
13) Other contract benefits, e.g., grievance procedure; seniority system; vacations and holidays with pay; toilets, washing facilities and clean, cool drinking water in the fields.

The time has come for justice for farm workers! United Farm Workers are doing the work and making the sacrificies that will bring that result. They need your support!!

"Why are our opponents so afraid of a union for migrant farm workers? Is it so much to ask that the poorest people of the land have a measure of justice?... Somehow these powerful men and women must be helped to realize that there is nothing to fear from treating their workers as fellow human beings. We do not seek to destroy the growers. We only wish an opportunity to organize our union and to work non-violently to bring a new day of hope and justice to the farm workers of our country." ---- CESAR CHAVEZ

Migrant Workers

January 16, 1974

Brothers and Sisters:

I'm sorry I can't be with you today as planned but I feel that yesterday's tragic accident in Blythe California requires my personal attention.

A bus carrying 45 lettuce workers missed a turn and plunged into a canal of water 8 feet deep. Nineteen of our brothers were killed. Seven are in critical condition, one paralyzed.

Too often we've seen unsafe buses for the workers go without needed repairs. Too often we've seen farm workers driving 125 miles and more before and after work because the growers and labor contractors won't spend the money to hire bus drivers.

It is physically impossible for a worker to drive a bus that far every morning, work all day in the fields, and then drive the other workers home at night, day in and day out, without rapidly impairing the physical ability needed to safely operate a bus. Since its inception our Union has fought against the greed of growers and labor contractors who care more about a few extra dollars than they care about human lives. Perhaps now you can see why we do so.

The seven seriously injured farm workers are now in the hospital at Blythe, a hospital totally inadequate for the emergency even if Mexican green-carders could otherwise expect good care. Therefore, the Union is making arrangements to have our injured brothers moved, if at all possible, to San Diego where they will receive better treatment.

Even though all of the killed and injured are not members of the United Farm Workers, there is no other organization willing or capable of handling the emergency. I have directed our field offices, our Union headquarters and the Farm Worker Service Center to immediately take whatever action is necessary to assist the injured and the families of the deceased. The Mexican government is demanding $1000.00 for the return of each body and so far has prevented our attorneys from speaking with the survivors.

All union offices will shortly be directed to begin raising the money needed to cover medical and funeral expenses of the Blythe victims. Only when there is a strong union truly representative of farm workers will such tragedies as this be avoided.

Much as I regret being unable to speak with you today, I feel it is necessary for me to personally take charge of the situation.

I beg your forgiveness for my absence and hope that you understand.

Viva la Cause!!!

Cesar E. Chavez

THE COCA-COLA COMPANY FOODS DIVISION'S

AGRICULTURAL LABOR PROGRAM

A PROJECT IN PROGRESS

The following report outlines progress being made in The Coca-Cola Company Foods Division's Agricultural Labor Project in Florida. This report reflects accomplishments since the last report was issued on December 31, 1971.

I. In the area of housing, the following objectives and/or activities have been accomplished:

1) Twenty-five of the 85 two-to-four bedroom, landscaped homes in the Lakeview Park site have been occupied.

2) Of the total, 33 homes have been completed and 14 more are under construction. Seventy-one plans for new homes have been submitted to and approved by FHA.

3) Fifty-eight applications have been submitted to FHA; to date, 34 have qualified and been approved and none has been rejected.

4) Improvements to the common land in the Lakeview Park site have been designed and accepted by the Homeowners Association. These include walkways, tot lots, a pavilion on the Lake Clinch beach for recreation and community activities, a play area, a basketball court and a parking lot to accommodate field equipment, buses and trucks.

5) Six applications for mortgages for new homes in Indiantown have been facilitated by the Fort Pierce/Indiantown Community Development Corporation serving that area. The

Community Development Corporations (CDC), run by the workers, govern and implement activities in the area of health, education and social services.

6) Company-provided houses are being phased out in the Avon Park/Frostproof/Wauchula area. Assistance in finding new homes for groves employees in this area has been offered by a Company housing specialist. Of the 22 families needing to be relocated, six have chosen to take care of their own needs independently. Of the remaining 16, twelve have been put into contact with a realtor or builder who has been screened for reliability and who can arrange for FHA low-income housing. Two families have moved into new homes and two more have made FHA applications. Referrals have been identified for the other four, but contact has not yet been established.

II. <u>In the area of health, education and social services, the following objectives and/or activities have been accomplished</u>:

A. 1) The Ft. Pierce/Indiantown Community Development Corporation (CDC) opened its Child Development Center in Indiantown on January 10, 1972, five days ahead of schedule. Seventeen children of mothers working for the Company are already enrolled, with additional enrollments anticipated. The children range from four months to 5 1/2 years. A staff consisting of a coordinator and six aides operates the center from 6:00 a.m. to 6:00 p.m., five days a week.

2) A second Child Development Center in Ft. Pierce is planned.

3) The Child Development Center staff continues to receive training one night a week and one full Saturday a month. In addition, the Vocational Home Economics Department of the State Department of Education has provided a full-time educator to teach the staff all facets of operating a child development program, leading the staff to para-professional status.

4) Application under Title IV-A, funds for voluntary agencies for day care for low-income families, has been submitted by the CDC. If approved, these funds will provide 75 percent of Child Development Center costs.

5) The first annual meeting of the CDC, held on February 19, was attended by over 200 persons. New Board members were elected by secret ballot and reports were presented at a session marked by a luncheon and by entertainment.

B. 1) The Avon Park/Frostproof/Wauchula Community Development Corporation has negotiated a lease with the Company at one dollar a year for the use of the former Labor Dormitory Campus at Frostproof as a multi-purpose community center. The Campus, consisting of eight buildings surrounding a grassy recreation area, will be utilized for a Child Development Center, a Living-Learning-Library Center, a recreation center and offices of the Community Health Aide and of the Community Coordinator, as well as for classes and meetings. The dormitory campus, constructed in 1970

to house single harvesting workers, is no longer needed for that purpose, due to stabilization of the work force and increased productivity of the harvesting employees.

2) Bids have been received for the remodeling necessary to create the new Child Development Center, which is scheduled for use in May. Application for Title IV-A funds, similar to the Ft. Pierce/Indiantown application, has been submitted.

3) The Living-Learning-Library Center will be funded through a $75,000 grant under the Library Services and Construction Act, and a $25,000 contribution by the CDC out of its 1972 allocation from the Company. It will utilize one of the buildings in the Campus complex. The program will be determined and operated by the CDC under contract with the State Division of Library Services, which will offer supervision, administrative guidance and advice. In conjunction with intensive use of printed and audio-visual media, stress will be placed upon such programs as a reading and study center, tutoring , participation in clubs and other activities of interest to the local population, self-help programs, use of drama, recording of oral portraits, life styles and cultures, and various art forms.

4) In the face of a severe shortage of dental services, the CDC has provided, for the second time, a volunteer dentist for two full days, utilizing the Department of Health's Frostproof facility, for adult emergency and child preventive treatment.

5) A Youth Committee has been established, composed of boys and girls who are in the Frostproof High School Band. The Committee will seek: to form a local band, to develop and publish a newsletter and to serve as a nucleus for encouraging youth to enroll in college.

6) Regular monthly sessions with the CDC's attorney on basic legal rights, contractural agreements and consumer problems have been started.

C. 1) The Central Region Community Development Corporation has continued the activities referred to in previous reports.

2) The Board continues to stress the need for educational activities for its own members and accordingly has made available programs in basic reading and writing and in consumer education. It is also sponsoring group meetings with local health personnel for educational and program purposes.

3) Two factors that tend to slow down progress in program implementation -- the geographic spread of communities involved and the severe need among the people for better communication skills -- have been recognized and attempts are being made to overcome them.

4) The CDC's Building Committee has chosen a site for its Community Center and requested approval by the Company. It has developed a proposed design for the building.

5) The CDC has engaged an attorney to conduct its legal affairs and to provide classes in legal rights and obligations.

D. Monthly, two-day training sessions have been held for the CDC Board members, as previously reported. They will continue through May, when they will be evaluated for the purpose of further training plans. As part of the training program, handbooks on job descriptions for 15 different positions in the Agricultural Labor Project affecting the CDC were developed and used as training tools. Guidelines for Board members on effective operation of the Community Development Corporations were developed and adopted. Handbooks on management for the Board's supervisory personnel were developed and adopted. These include standards of performance, management procedures and personnel policies and practices.

E. 1) The medical screening and referral program for all non-regular employees and for family members of all employees, a total of approximately 4,000 persons, got underway on January 10 in the Wauchula area. The program consists of three parts; (1) a pre-screening interview to gain the involvement of the family, (2) an interview to obtain the basic medical history and the taking of necessary specimens and (3) a medical examination by a physician together with interpretation of results and referral to private or public medical resources where indicated.

2) The following are some of the findings based on the first 24 families (82 individuals) taking the medical examinations:

9.8% had major illnesses

21.9% had minor illnesses

99% had poor dental health

E. Reading Is Fundamental, a supervised, free distribution of new books selected by the people, has been underway during the past three months. The program is carried out by the Community Aide in charge of the Mobile Community Center. The aide underwent a period of training in the principles of the national Reading Is Fundamental program. These included helping the people select books and methods of ordering, acquiring and distributing books and other media. The three Community Development Corporations allocated funds for books in their 1971 and 1972 budgets and set up RIF committees to assist in subject and title selections and to make arrangements for local distribution facilities. Distribution has occurred at planned intervals with the involvement of CDC's RIF Committee members, either at fixed locations close to the people to be served or through use of the Mobile Unit where necessary. The CDC's and their RIF Committees are currently assessing the program and seeking to improve its usefulness to the people.

III. <u>In the area of organizational development</u>:

1) Application of the techniques of normative systems analysis and implementation has begun. As of February 1, 24 out of 35 harvesting crew foremen have been keeping daily records with weekly averages of harvesting effectiveness. Recorded are the number of boxes picked and the number of days worked for each harvester. The foreman is thus able to see at a glance where irregular attendance or poor production occurs and can point out to his associates how these factors affect

their earnings. Achievement awards for crew effectiveness are additional incentives.

2) The normative systems implementation in Groves Operations has proceeded with the development of tools for increasing productivity and equipment maintenance and repair standards. Application of these tools is through regular, planned meetings between supervisors and employees, and supervisors and district managers.

IV. In the area of community relations:

The Company is continuing its documentation and public information activities described in previous reports.

Coca-Cola Unit, Chavez' Union Reach Agreement

Citrus Contract in Florida Is First in Southeast; Other Growers Opposed

Pay, Fringes Are Increased

3/1/72

By a WALL STREET JOURNAL *Staff Reporter*

MIAMI, Fla.—Things go better with Coke, according to the United Farmworkers Organizing Committee. They wouldn't, retort other citrus industry interests, if Coke hadn't knuckled under to union threats of a national boycott.

These, in essence, were the reactions of the Florida citrus industry spokesmen to announcement of a three-year agreement between the farmworkers and the Coca-Cola Co. foods division. The accord provides for pay and fringe-benefit increases for the company's 1,200 agricultural workers in the state.

Under its terms, the 300 full-time, hourly paid workers will get increases of 25 cents an hour the first year and the 900 piece-rate harvesting workers will get an increase of five cents a box for most fruit picked.

A union spokesman said the contract provides for additional increases in each of the next two years, but said he didn't know the exact amounts.

The company's hourly paid workers were getting $1.85 to $2 an hour and the base rate for seasonal harvest workers on oranges had been 35 cents a box.

Union Hails Accord

The union hailed the settlement as the first collective-bargaining agreement for Florida citrus, as well as the first in the southeast for the California-born labor organization.

Cesar Chavez, head of the union, told a press conference here that "I hope this will break the dam for our movement in Florida." That isn't likely, some industry officials indicated.

Fred Adkinson, president of the Citrus Industrial Council, Lakeland, denounced the agreement as "an absentee-type contract between a union, with no roots in the area in which it is operating, and a huge conglomerate company with a lot of other interests besides citrus."

INFORMATION

ABOUT THE COCA-COLA COMPANY FOODS DIVISION'S AGRICULTURAL LABOR PROJECT

M — Ag. Workers — Coke Project

A PROJECT IN PROGRESS

The following is the first in a series of reports to outline progress being made in The Coca-Cola Company Foods Division's Agricultural Labor Project in Florida. This project is designed to raise the standard of living and the quality of life for groves and harvesting employees -- including migratory labor -- in the Division's citrus operations.

In reporting the accomplishments to date in this program a review of the guiding principles and objectives of the total activity could perhaps best place those accomplishments into proper perspective.

Seasonal agricultural workers have long been enmeshed in a tragic cycle of poverty, hoplessness and despair. Simply stated, the end result of the Foods Division's program is to break this cycle as it pertains to workers in its own Florida citrus groves.

We expect that this effort will be a long and difficult one. There will be, no doubt, setbacks and even specific temporary failures. Nonetheless, we are pledged to seeing it through successfully, making certain that this program's achievements are lasting ones.

PRINCIPLES OF THE PROGRAM

The Agricultural Labor Project is based on several underlying principles that are guiding all its activities. Briefly, they are:

--- That the program will be effective only to the extent that it fully involves the workers themselves in the solutions of their own problems and in the creation of their own destiny. We will guard against the assumption that one person can determine for another what is in his own best interest.

--- That the emphasis of the program must be upon accomplishments rather than promise. After years of promises and plans that have never come to fruition, seasonal agricultural workers have developed a "show me" attitude; thus, while the program is being implemented along a long-range time table, every effort is being made to continually take visible, immediate action in improving the life of the worker whenever and wherever possible.

--- That this program will be truly successful only when it is capable of sustaining and extending itself on a viable economic basis. A realistic repeatable model of social change, which can serve as a practical example to others, must in the long-run be capable of returning as much or more than it expends for it is only when that occurs that continuing progress and commitment can be assured.

--- That the program emphasize a self-help potentiality that exists within all of us. Paternalistically applied welfare programs, no matter how well intended, tend to demean the recepient as well as the donor; thus, interferring with the development of that human dignity and self-respect which is so essential to meaningful human progress.

--- That the complexity of the problems confronted in the project call for a systematic, sustained and fully integrated approach to bring about social change. Piecemeal, spasmodic and short-term efforts are not

likely to prove successful in alleviating deeply rooted traditional socio-economic patterns that have evolved and become institutionalized over periods of hundreds of years.

COMPONENTS OF THE PROGRAM

In summarizing the overall program, five main areas of activity emerge: (1) employment; (2) housing; (3) education, health and social services; (4) organizational development; and (5) community relations.

Sustained success in one of these areas is dependent upon success in the other four as they are so closely interrelated. For example, it is unlikely that a person with poor health will be able to make maximum use of employment or that a person with a lack of income potential will be able to purchase and maintain a home in which his family can live comfortably and with dignity.

In the area of employment, we are concerned with insuring productivity and in seeing that each employee has an opportunity to earn sufficient income to maintain himself and his family in a manner compatible with his basic needs. Questions of productivity, employee benefits, working conditions, training and orientation and opportunity for advancement all fall within this area.

It is our goal to see that groves and harvesting employees of the Company and their families have a chance to live in a decent, well-maintained house of their own selection and ownership. Programs to assist people in planning, purchasing and/or renting and maintaining their own homes fall within this area.

We are concerned with identifying worker needs in regard to health, education and social services and from them determining what existing services have to be made accessible and what new services have to be created to meet these needs. We will employ para-professionals drawn from the worker community itself to insure that the people's needs and the available resources and services are, in fact, connected.

Extensive training of management supervisory personnel and foremen will be undertaken to solicit their committment to the success of this program.

In the area of Community Relations, we are concerned with all relevant individuals and organizations such as growers, social action groups, federal and local social service agencies, state, county and municipal communities, etc. Those groups and organizations will be kept informed about the program so as to provide as much positive support and involvement as will be helpful to the interest of the seasonal harvesting employees.

To date, the following objectives of the Agricultural Labor Project have been achieved:

1. Three hundred groves employees, i.e., those who cultivate the land as opposed to harvesting personnel who pick the fruit, have been upgraded to "regular" employee status. As a result, those employees received a 23 percent increase in wages -- approximately $17 weekly -- and are now entitled to all benefits received by other regular employees of The Coca-Cola Company Foods Division, including health insurance, retirement and thrift (stock) benefits, vacations and holidays.

2. A Committee on Housing, composed of four harvesting employees, is surveying their fellow harvesting employees to determine their needs and desires on housing.

3. The Winter Park, Fla., architectural, engineering and planning firm of Schweizer Associates has been retained by the Foods Division to assist in planning new housing facilities to be purchased by the harvesting employees.

4. The Company has designated a 40-acre site of land for the expressed purpose of making homesites available to the harvesting employees.

5. A program of temporary improvement of current housing for harvesting employees has been completed. This temporary clean-up and repair project (carried out where possible by the workers themselves at $1.75 to $2.50 per hour) included:

-- general clean-up of grounds surrounding housing sites

-- removal of old cars and other large debris

-- painting of interiors of all houses

-- repair (or new) screens, doors, windows, etc. on current housing

-- playground equipment put into all living areas

-- sinks installed in houses

-- showers and hot water installed in all bathroom facilities

-- pest and rodent control program begun on regular basis

-- garbage pick-up begun on a regular basis

6. A committee composed of harvesting employees has been formed to advise on needs in the area of health, education and social services.

Four social service centers will be built and equipped to serve harvesting personnel.

7. Ten new buses, complete with toilet and first-aid facilities, have been delivered for use in transporting harvesting employees to and from the groves. Fifteen additional new buses have been ordered for delivery prior to the opening of orange harvesting season.

8. Fifteen existing buses have been reconditioned to include toilet and first-aid facilities as part of the total program to upgrade transportation for harvesting employees.

9. William Kelly, vice president and personnel director of The Coca-Cola Company Foods Division, has been named vice president of Groves Operations, with the major responsibility of implementing the Agricultural Labor Project. He has relocated from Houston to the Florida offices.

10. Gerald Abell, executive staff representative in the Corporate Personnel Department of The Coca-Cola Company, has been named manager of the Agricultural Labor Project, reporting to Mr. Kelly. Mr. Abell has relocated to Florida.

11. Scientific Resources, Inc., a behavioral science organization, has been retained to assist in the coordination and implementation of the project.

12. The first action of an employee development program has been the promotion on September 1 of a Black foreman to the position of area-supervisor.

13. A dormitory facility for harvesting employees, considered to be substandard, has been closed down permanently.

14. The Agricultural Labor Project has been discussed with representatives of both government and private social service agencies, including Opportunities Industrialization Committee, the U. S. Public Health Service, the Department of Health, Education and Welfare and the Office of Economic Opportunity to solicit their advice, counsel and/or assistance in various phases of the total program.

A PROJECT IN PROGRESS

Report #2

The following is the second in a series of reports to outline progress being made in The Coca-Cola Company Foods Division's Agricultural Labor Project in Florida. This project is designed to raise the standard of living and the quality of life for groves and harvesting employees -- including migratory labor -- in the Division's citrus operations.

This report reflects accomplishments achieved since the issuance of the first progress report on September 15, 1970.

In that period the following objectives of the Agricultural Labor Project have been achieved:

1) The Company has designated an additional 15 acres of land for the expressed purpose of making home sites available to the harvesting employees. (A 40-acre site had earlier been set aside for housing.)
2) A dormitory to house single harvesting employees (as opposed to the family employees) that was considered to be substandard, has been demolished. It will be replaced with a new dormitory complex, to include a dining hall and a recreation facility, all situated in a campus-like atmosphere.
3) Mrs. Georgia Rushing, selected from the worker population, has been hired on a full-time regular employee basis as the first para-professional in the program. She will be trained to coordinate the various activities of the health, education, and social services aspect of the program.

4) The first social service center has been opened in temporary quarters, pending completion of permanent facilities. The center is staffed and in operation.

5) Four crews of harvesting personnel, totaling 100 persons, have been selected to participate in a pilot program on compensation. At the present, it is a general industry practice to pay harvesting employees on the basis of the number of boxes of fruit picked. These 100 employees, however, will test a compensation program involving a combination of the piece-work rate plus an hourly wage.

6) The Employee Committee on Housing has completed a survey of all occupants residing in Company housing. Results of the survey, which was conducted to determine the needs and desires of the families, have been turned over to the architectural firm retained by the Company as consultants in the housing area.

7) On October 17, families living in Company-owned housing, which represents about 175 persons, attended a "new community" get-together. This meeting included the following activities:

   (a) An exhibit of community plans, mortgage assistance programs available to prospective homeowners, development and construction schedules, which the community members could study, suggest changes and ask questions.

   (b) A discussion by groves management on the total Agricultural Labor Program with particular emphasis on housing. This was followed by a question-and-answer period.

   (c) A tour of the two sites set aside by the Company for employee housing.

8) Three different three-day training seminars were conducted in October for all levels of groves and harvesting management personnel. Participation

ranged from the president of The Coca-Cola Company Foods Division to harvesting supervisors and grove unit superintendents and harvesting foremen. This sensitivity-type training program was conducted by Scientific Resources, Inc., the New Jersey-based behavioral science group retained by the Company as consultants in the Agricultural Labor Program.

9) Applications for mortgages on new homes have been completed by all of the families currently living in Company-owned housing. These applications are now being reviewed by the mortgaging institution and relevant federal agencies.

Inquiries regarding this report should be directed to:

Our 37-year-old apparatus for helping rural Americans has enriched a favored few, but never accomplished its original purpose. Wiser, more effective means are at hand—if taxpayers will speak sharply to their Congressmen

Time to Say No to Big-Farm Subsidies

By Eugene H. Methvin

Just try to fathom it. Two years from now, the federal government may be paying out more money in subsidies to farmers than it now lays out for crime and narcotics control, urban renewal, mass transit, water- and air-pollution cleanup, rural development and job training—*all combined*. Impossible? Not at all. For at this moment legislation is moving through Congress that by 1972 will present a fantastic $5 billion yearly to farmers *not* to grow cotton, wheat and feed grains.

The chances of this occurring are starkly real. And it worries thoughtful agricultural authorities. "At a time when important rural development, educational, health, housing and nutritional programs are being starved for funds," says former Under Secretary of Agriculture John A. Schnittker, "it does not make sense to continue exorbitant subsidies to thousands of farmers who already have high incomes and substantial wealth."

Indeed it does not. But it is happening. Yet the case is conclusive against continuing the old farm remedies devised nearly four decades ago. Ponder these facts:

- Farm subsidies have been costing us taxpayers $3.5 billion yearly. And this is only a part of the total cost, for they also boost the prices that we consumers must pay in the market. Cornell University Prof. K. L. Robinson estimates that the total effect is equivalent to a five-percent food tax—or about $100

File : Farm Problem

per family of four yearly. These payments are "doubly regressive," adds Michigan State agricultural economist James T. Bonnen, because "a major share of the cost is borne by consumers with below-average incomes, and a major share of the benefits goes to farm producers with above-average incomes."

• In the last four years alone, the Treasury has poured out $13.6 billion in farm subsidies. Yet, ironically, the payments have only intensified the very problem they were originally intended to cure—rural poverty. In 1968, the USDA mailed checks to 2,371,634 farmers. But two thirds of these got less than $1000 each, a skimpy 18.7 percent of the total $3.5 billion pie, while the lion's-share remainder was divided among only 785,242 big farmers. These payments helped the big farmer finance land acquisition and faster mechanization. "They sharply reduced farm employment, inducing heavy unemployment and consequent geographic movement of people," says the USDA's economic development director, John H. Southern. "They pushed the smaller farmer and middle operator farther behind in the struggle for technological adjustment."

A shocking result: Among those left out of the program, 400,000 farm families—one seventh of the total—average only about $600 a year income. (They will be eligible, under President Nixon's proposed family-aid plan, for direct grants to bring them up to the minimum income of $1600 per family.)

• Twenty-six million Americans, one fifth of our total population, lived on farms in 1947. Only ten million, one twentieth of the population, remain there today. Of these, two thirds are in increasingly difficult straits. Economists predict that we will ultimately have only 2.5 million farm people.

Must we now force more millions into cities, with the attendant problems of pollution, frustration and violence? Six out of ten adults in the nation's metropolitan centers, a Gallup poll shows, would prefer living in small towns or on farms. As President Nixon said in his last State of the Union message, "We must create a new rural environment which will not only stem the migration to urban centers but reverse it."

Nevertheless, Congress may now renew, with only minor cosmetic changes, the same discredited farm program that has intensified rather than eased the technological hurricane that helped depopulate and devastate America's rural culture.

Old King Cotton. How can Congress even contemplate such a course? The answer lies essentially in its archaic structure and rigid seniority rule, which delivers crucial legislative decisions to aging chairmen and narrowly composed committees incapable of weighing broader national needs.

The farm-subsidy scheme began in 1933 with the theory that the best

way to help depression-impoverished rural people was to guarantee higher prices for crops. In exchange, the farmers were required to limit the acreages they planted. Farm Congressmen soon convinced their constituents—and themselves—that their future depended on maintaining these subsidies, not on adjusting to changing technology and market demand.

Periodic Democratic or Republican sweeps in the wheat and corn belts left Democrats from the one-party "Solid South" in command, by seniority and survival, in the 34-member House Agriculture Committee. Result: Over the years, by rigging the payment programs and acreage allotments, "cotton men" have so fattened up the subsidy that cotton producers now draw half their gross income from the U.S. Treasury (compared to a third for wheat farmers, a fourth for feed-grain growers). Today, 13 of the 19 Democrats who dominate the House committee represent cotton, tobacco and peanut districts, embracing 12,143 producers who in 1968 collected an average federal payment of $14,379 each. Capitol veterans consider it a complete explanation of such a legislator's politics to say, "Oh, he's a cotton man."

Hunger as Hostage. The king of the House Agriculture Committee is its chairman, a wily 70-year-old Texas politician, W. R. "Bob" Poage, who came to Congress 33 years ago. Twice in the last two years, fed-up legislators overwhelmingly voted a $20,000 limit on payments to any one farmer, but Poage outfoxed them by accepting the Senate's unrestricted version. This year, with a showdown certain, he is trying an even more brazen strategy.

Urban and liberal Congressmen are eager to pass President Nixon's drastic reform proposed last May, to extend food aid to every needy American. (Only seven million of the nation's estimated 10 to 15 million hungry are being aided at present.) "Something very like the honor of American democracy is at stake," the President said. He proposed increasing the food-stamp program to $1.5 billion a year—six times the level authorized by Poage's committee.

The Senate promptly approved. But Poage bottled the reform up in his committee, awaiting this year's fight over the farm-subsidy extension. "It's the old vote-swap routine," explains Rep. Paul Findley (R., Ill.). "He's holding the hunger program hostage, in order to corral votes for his $2 billion for cotton."

Poage's committee oversees federal hunger programs simply because they began as efforts to dispose of the USDA's mounting surpluses. But the committee's chief concern has never been the programs' effectiveness in reaching the hungry. After repeated investigations found serious hunger and malnutrition in the nation, particularly in farm areas depopulated by the tractor revolution, the Senate in 1967 urgently authorized $25 million in emergency food and medical help. Poage and

his committee killed the proposal by a 22-7 vote. Last October, to an Urban Coalition witness urging prompt action on President Nixon's hunger legislation, Poage growled: "I have not understood why you and others are so concerned in maintaining a bunch of drones. You know what happens in the beehive: they kill those drones. This is what happens in most primitive societies. Maybe we have just gotten too far away from the situation of primitive man." (His words were eradicated from the published transcript.)

Rural Rags and Riches. The wretched record of the farm program in Poage's own Texas district is all too typical. Poage's 11 counties lie mainly south of Dallas. Incredibly, 109,476 of the 421,100 people fall below the official poverty level, with 17,508 living on welfare checks averaging $624 a year. Many are struggling along the tattered edge of subsistence agriculture. But a favored few 527 farmers flourish in the federal hothouse, harvesting $5000 to $103,581 each from the USDA—or a $12,536 average.

The contrast is most stunning in the easternmost four counties along the rich Brazos River valley. Cotton is the traditional big crop here. The four counties since 1950 have lost 19,865 population—more than one in five persons—and the small towns are drying up. Poverty, the bulk of it among rural whites, runs two and three times the national level.

Public Health Service physicians conducting a nutrition survey examined 289 people from 79 Limestone County families, two thirds of them poor. Most were elderly small farmers or children of displaced farm laborers. The doctors found shocking hunger and malnutrition: a third of the children under six, and 15 percent of all examinees, suffered from anemia due to diet deficiency. All needed immediate medical attention.

Incredibly, Poage has voted "nay" on each of three crucial votes over the past nine years on the Economic Development Administration, one federal program that offers depressed rural regions real hope. EDA's efforts in Poage's own district show how help can be channeled to depopulated farm areas. With two business loans in Falls and Robertson counties, totaling $1,277,000 (less than half the $3,419,000 showered on 194 farmers there in a single year), EDA has sparked a rug manufacturer and door fabricator to open plants that will provide 255 jobs.

"Jobs, adequate payrolls—that's the only answer we know," Marlin Chamber of Commerce director Ray Cole declares. "The farm subsidy checks end up in the hands of a few." His county, Falls, ranks among the poorest in the entire nation, with a family income average of $2287, and 61 percent of the families under $3000. In 1969 its unemployment level stood at 8.3 percent.

Not Again! Whether Poage's callous strategy of holding hunger legislation hostage for renewal of farm subsidies will succeed depends

squarely on the American public. Since the Administration thus far has declined to recommend any real agriculture-subsidy reform, Congress may simply go along with Poage—*unless the nation's voters tell their legislators sharply, "This time say no!"*

The American Farm Bureau Federation, whose membership embraces 1,800,000 families, is offering Congress and the nation a promising proposal (H.R. 9009) for drastically slashing farm subsidies, through a carefully phased program. Sponsored by 20 Senators and 43 Representatives of both parties, the proposal would:

- Reduce the $3.5-billion yearly subsidies for cotton, wheat and feed grains by one fifth each year, ending them entirely after 1975.
- Empower the USDA to negotiate contracts with farmers to retire at least 50 million acres of cropland, preferably whole farms, over the next 15 years. This would soften the impact of ending government surplus purchases and crop controls, while leaving farmers who choose to continue planting free to select their crops in response to market demand.
- Provide grants and loans to the thousands of struggling farmers who can never make a decent living on their few acres and hence must train for new off-farm jobs.

How would American farmers fare under such a program? Many have demonstrated that they neither need nor want perpetual subsidies. Out of some 250 U.S. farm commodities only cotton, peanuts, sugar, rice, tobacco, feed grains and wheat—40 percent of total farm sales—are subsidized and controlled. The other 60 percent of American agriculture is marketed without Washington's benevolent management. Producers of commodities from soybeans to livestock regularly shift production to meet consumer demands, and earn fair returns. Cattlemen, totally uncontrolled, are getting their highest prices in 18 years.

On the basis of studies by Iowa State University economists and others, Farm Bureau president Charles Shuman estimates that by 1975 his organization's plan could reduce the taxpayers' outlay for agricultural subsidies to one third or one half the present level. The savings could be plowed into President Nixon's new rural-development programs and benefit far greater numbers of rural Americans, many of whom are now left out in the cold. Shuman declares, "We believe it is time to get off the old dead-end road of government subsidies and embark in a new direction that will help *all* rural people. The issue's as simple as that."

I thought you might want to know of these information sheets regarding the lettuce boycott now underway in Atlanta.

LETTUCE STRIKE FACT SHEET

The events are complex but the issue in the Salinas Strike is simple: WILL FARM WORKERS HAVE THE RIGHT TO CHOOSE A UNION OF THEIR OWN OR WILL THEIR EMPLOYERS CHOOSE A UNION FOR THEM? The workers in the Salinas Valley, including Chicano, Filipino, Black and White brothers and sisters, organized quietly and waited patiently for a victory in Delano. As that victory took shape the workers asked for union representation elections in Salinas so they could choose their own union. The Salinas growers ignored their request for elections, sought out a local Teamsters Union and signed "back door" contracts, so called because Teamster leaders and growers met in a plush motel and made agreements without consulting the workers and without the knowledge of the workers. When these contracts were announced the workers were frustrated and angry.

The workers marched in Salinas, held rallies, organized ranch committees and went on strike at selected ranches to express their desire for their own Farm Workers Union. The Teamsters signed a juristictional agreement honoring UFWOC's right to organize farm workers. Most growers refused to release the Teamsters from the contracts.

Therefore, the massive strike began involving 7000 workers. Interharvest Co. signed a contract with UFWOC after an election supervised by the Catholic Bishops Committee proved that the workers wanted UFWOC. Also Freshpict and D'Arrigo Bros. have since signed UFWOC contracts. Judge Marion Smith in Santa Maria refused to grant an injunction against the UFWOC strike, which the growers sought, ruling that the strike was not juristictional since the Teamsters were unable to present evidence that they represented the workers. However, Judge Anthony Brazil issued a permanent injunction against UFWOC strike activity, which led the union once again to our only non-violent alternative -- the BOYCOTT.

In the 5 year struggle in Delano, Cesar Chavez and the farm workers with him demonstrated that non--violence can work. Through sacrifice, determination, and plain hard work they brought about a revolution in the grape fields. Millions of concerned people like you helped make that possible. The Salinas strikers need your help now. BOYCOTT FOR JUSTICE!

PLEASE ASK YOUR STORE MANAGER FOR FARMWORKERS UNION LABEL LETTUCE.

DEMAND TO SEE THE UFWOC EAGLE ON THE LETTUCE CARTON IN COLD STORAGE!

DON'T BE SATISFIED IN SEEING AN EMPTY BOX WITH THE UNION LABEL .... YOU HAVE A RIGHT TO KNOW WHAT YOU ARE BUYING.

FARMWORKERS AFL-CIO UNION LABEL

BOYCOTT STORES THAT HANDLE NON-UNION LETTUCE!

Labor donated

Dear Friends,

The United Farm Workers Organizing Committee, AFL-CIO, has signed contracts covering the largest lettuce producers in California and Arizona. Every packing carton produced under these contracts will have the "Farmworkers AFL-CIO" union label with the UFWOC eagle stamped on the packing box. All other California and Arizona lettuce will be considered scab.

These contracts cover approximately 25% of the California and Arizona harvests and are adequate to supply the major chains and any wholesaler who specifically orders union lettuce. Please ask your wholesaler to carry these brands and supply you with Farm Workers Union lettuce.

BEWARE OF SCAB LETTUCE! Some growers have stamped their boxes with Teamsters labels and "picked and packed by union labor" rubber stamps or notices. This is a LIE! These growers have legitimate contracts with the Teamsters for packing and shipping their lettuce, but they do not have legitimate contracts covering their field workers. This lettuce is SCAB LETTUCE! picked by illegally imported strikebreakers. Please insist on seeing the "Farmworkers, AFL-CIO" union label and UFWOC eagle on every packing carton.

****

UNION LABEL LETTUCE: The following companies with their brand names, are Farm Workers Union Label lettuce growers:

1. INTERHARVEST, INC.

Blue Chip	King City	Favor	Amigo
Eagle Eye	Eagle	Gold Star	King Pin
Hawk Eye	Nunes Brothers	Queens T	Pasco
Chiquita (wrapped)			

2. FRESHPICT FOODS, INC.

Ram	Sun Blush	Three Crowns
Prime	Freshpict (wrapped)	

3. D'ARRIGO BROTHERS, INC.

Andy Boy	Carousel	Green Head

HOW YOU CAN HELP WIN THE LETTUCE BOYCOTT

1. Visit a chain store(s) twice a week to check the lettuce and talk with the manager. Let us know what you find.

2. Visit colleges, schools, hospitals, restaurants, church institutions, explaining the boycott and asking them to help farmworkers by purchasing Farm Workers Union lettuce.

3. Arrange for speaking engagements at churches, union meetings, house meetings, clubs, groups, etc. Someone will be available to attend.

4. Arrange for publicity in organization newsletters and newspapers. Write letters to the editor in your local newspaper.

5. Design and distribute leaflets and posters for publicity.

6. Get important organizations to pass resolutions supporting the boycott. The press should get this information.

7. We always need paper and office supplies if anyone is willing to donate.

8. Help us raise money by selling posters, bumper stickers, buttons. Arrange fund raisers such as concerts, car washes, wine-tasters, dinners, etc.

9. When the time comes, help us leaflet and picket a selected chain store.

10. We are open to your suggestions also.

If you form a local committee or if you are working on some of these actions individually, please let us know what you are doing.

JACK AND THE BOYCOTT

" YOU CAN MARCH OUT HERE FOREVER BUT HE AIN'T GONNA GIVE IN."

" JACK'S IS A BAD PLACE TO PICKET."

" You're under arrest!" What a way to end a Monday, and that evening, June 14, sitting in a hot, stinking city jail cell, I was beginning to believe that the picketing of Jack's Liquor Store was a big mistake. I now had the time, while watching the roaches scurry about in complete freedom, to think about those statements made by our friends and foes.

We started with 6 pickets - and immediately had 3 jailed for criminal tresspass, (and bail set at $1000 each) and it looked like the above advice and words were coming true. Jack's Liquors was the initial target of picketing because they. refused to talk about their moral responsibility in continuing to sell Heublein products (like Italian Swiss Colony Wines and Smirnoff Vodka) while the Heublein Corporation has some 10,000 migrant grape pickers living and working under slave conditions. (See "Big Ol' Winemaker" story).

We sent out a call to some of our supporters for help on the picketline, and continued to picket in spite of rain storms, constant police harrassment ("you can't walk across the driveways") and seemingly very little support on the line. Jack's hired 2 special policemen to protect his store, and we dug in for a long seige. We were now determined to make our stand here and not be moved.

For the most part, Black folk, union members and people from the Little 5 Points neighborhood respected our line, and on Friday night we discovered that the store seemed rather empty and quiet.

Saturday, we returned with spirits renewed and 4 additional people, which proved to be the breaking point. After 2 hours of picketing, the manager came out and said: "Mr. Mariano, J.C.Garner would like to talk with you on the phone."

Mr. J.C.Garner is the owner of Jack's as well as Bailey's Supreme Coffee and is rumored to be a millionaire.

"Mr. Mariano, what do I do to get the pickets off?"

(continued on page 2)

FIREPOWER VS. SOUL POWER

"I TOLD YOU NOT TO FOLLOW MY TRUCKS! YOU'RE GONNA GET BIG TROUBLE! YOU BETTER BELIEVE IT!"

"We believed you Sunday."

"MY CUSTOMERS SAID 'FORGET IT', THEY DON'T WANT ANYBODY TELLIN' THEM WHAT KIND OF GRAPES TO GET! YOU STAY AWAY FROM MY TRUCKS!!"

BANG! BANG! BANG! BANG! BANG!

HISS-SS-SS-SS. BANG!

"YOU GET THE MESSAGE!?!"

It's for real. This message was delivered by Jerry Harmon, produce deliverer working out of the Atlanta State Farmers' Market. He owns 3 trucks and was delivering non-union Arizona grapes to some of his customers. We followed a few of his trucks to find out who his customers were. They were sympathetic to buying union grapes and said they would tell Harmon.

Sunday A.M. June 28, Harmon came up to our van parked at the Market and said his customers wanted union grapes. We told him who he could get them from. It was a small victory.

Monday A.M. Mark and I saw non-union grapes on one of his trucks and began to follow the driver. After conferring with Harmon a few times the driver began leaving. We followed, while Harmon in a pickup and a man in a station wagon cut us off and forced us to stop.

He then delivered his message.

Our message to Harmon was an arrest warrant, which was served that evening for aggravated assault.

WE ARE NOT AFRAID

12 midnight I received a call saying the preliminary hearing was 9 A.M. the next morning. We began our journey to Clayton Co. court, complete with shot off crome strip, bullet slugs, shot-up tire and rim.

(continued on page 2)

JACK (continued)

"Just remove the Heublein products from your shelves", as we originally said.

Mr. Garner immediately ordered his manager to do just that, and UFWOC-Atlanta called off picketing at Jack's Liquors.

After the dust settled at Jack's, our staff discovered that nearby liquor stores had placed plain brown paper covering over the Heublein shelf display without even being approached on the boycott!

We also discovered, through a reliable source in the liquor industry that when Jack's was being picketed, the package store retailers had an emergency meeting about the situation. Although unconfirmed, it seems a conspiracy was in the making, as the Smirnoff distributor offered to bankroll the retail stores for any "extra" expenses (such as special police, loss of business, etc.), if they would fight the boycott. In keeping with a precedent of prevarications(like telling frantic store owners that it all would be settled, "in a few days"), the distributor never came through with the money, so the owners decided not to fight Heublein's battles.

It is difficult for these folks to realize that there are other ethics besides the dollar, as one dealer said: "I hope this is settled by negotiations because if you picket me, it'll cost you money."

"How?" we asked.

"Well, you have to pay your pickets, don't you?"

Asi es la vida. (Such is life).

SOLIDARITY FOREVER !

On July 8, UFWOC-Atlanta joined with other farmworker supporters around the U.S. in solidarity with massive demonstrations at Heublein's stockholders meeting in Hartford, Connecticut. Our 12 hour vigil at the office of United Vintners became a ten hour one because of rain and lonliness. Throughout the day we wore signs and passed out leaflets explaining our purpose. Out little old winemaker (a little bigger) told United Vintners (Italian Swiss Colony, owned by Heublein) that he was quitting until they had their grapes picked under decent conditions with a contract.

Despite the scarcity of supporters, CBS Channel 5 did a film interview with Joe. We thank them for that coverage and thank those supporters who visited with us:

Don, Judy, Anneke Bender
Phil Barnhart
Charlie Helms
Austin Ford
Vern King
Ron Lucas
Ted Brodeck

FIREPOWER (continued)

Harmon arrived with his lawyer, Ed Wallace and a court reporter. Wallace greeted Joe with: "You Commie S.O.B., You're gonna see what a Georgia chain gang is like!"

As things got heavier, Wallace questioned me on everything but the shooting incident: the union, Cesar, our staff, our budget, my background. Amid name-calling, threats, intimidation and shouting, Wallace accused Mark of shooting a gun first.

Miraculously, Harmon was bound over for trial by Justice of the Peace, MacMullen.

It was difficult to tell who was on trial especially when they tried to keep Joe from leaving by serving a subpoena. When he wasn't bluffed by that, a Harmon witness tried to physically stop Joe's car. The lawyer began screaming about a warrant for Joe's arrest on aggravated assault.

Even though we were fearful, we could say: "We are not afraid."

Kathy Mariano

BOYCOTT ITALIAN SWISS COLONY WINES
BOYCOTT SMIRNOFF VODKA

BIG ! OLE WINEMAKER

Heublein conglomerate had a profit of 17+ million dollars in 1970. They own such diverse companies as H.Salt Fish n'Chips, Smirnoff Volka, Kentucky Fried Chicken, A-1 Sauce. Why is UFWOC "picking on" Heublein?

... see page 5

Editorial

WE SHALL OVERCOME

We've had some pretty powerful lessons this past month.

Sitting in a dark, stifling, stench filled jail cell, unfit for animals, yet overcrowded with 3 other humans with no place to lie except the roach infested, urine stained floor ... While I was in that cell, the picketing at Jack's seemed like an impossible task. (See story: "Jack and the Boycott"). One week later, when the Heublein products were removed it felt good to come out of the depths of despair to the fresh air of our first "victory". I hesitate to use the word victory, because I really don't consider it a victory "over" anyone, but rather a small step towards justice and reconciliation. I often hear that the boycott is a dangerous weapon, and can be used against innocent folk. Perhaps it can be used, but I am convinced that the only type of boycott that can succeed is one that is rooted in recondiliation and seeking justice.

The powerful weapon of the picket line was clearly outlined at Jack's and made me realize that picketing is never a futile pastime. The value of additional pickets to join in to reinforce the confrontation and achieve a significant non-violent change was also displayed here. When a gray haired, respectable looking woman showed up on Saturday, it really made a difference in our credibility , and the management of Jack's had a difficult time in dealing with her presence there.

So in a sense, I feel there is a lesson for ALL here. If you believe in non-violent social change - you can make a difference on the picket line. Do you really believe that? I do.

Sitting in a small foreign car, while an angered produce purveyor fires his .38 caliber pistol at the car, bullets ricocheting all about, and realizing that no one is around to see the incident . . . and sitting in a Justice of the Peace's office in Jonesboro, Ga., realizing that you're not gonna get any justice ..... (See story: "Soul Power vs. Fire Power")

The ugly incident at the Farmers Market and the Jonesboro court, reminded me that the boycott and la causa is no game. It's all very real with the suffering and struggling here in Atlanta, only a small fraction of the everyday misery of farmworkers or for that matter, Black folk here in Atlanta. So once again, for a very brief moment, I had the feeling of overwhelming odds, of hopelessness and oppression. For a flickering moment in time, I was a Black in the colony or ghetto, I was a Jew in Warsaw in the 1930's, I was a Chicano farmworker in 1970.

I am not one who dies blindly for a cause. My committment to the farmworkers is because their philosophy is one that parallels my philosophy of life - that of love, concern for life, for non-violent revolutionary change in ourselves and society. The farmworkers will only succeed in ending slavery, degradation and human misery by appealing to people's sense of justice. They are too few in number to do otherwise.

The song goes: "We Shall Overcome". (Nosotros Venceremos), neither I shall overcome, nor you shall overcome. So farmworkers appeal to you Mrs., to you, Pastor, to you Mr., to you, brother and to you, sister.

It is our last and only hope. Do you really believe "We Shall Overcome?" I do.

Joe Mariano

MUCHAS GRACIAS !

The boycott is people.... full-time and more important, the people who support it in their free time. For the boycott to continue, it has to depend on all its supporters.

We w ould especially like to thank the following brothers and sisters who have helped us either financially or with food and supplies.

LEGAL REPRESSION HITS FARMWORKERS

STATE LEGISLATORS TRYING TO CRIPPLE U.F.W.O.C.

On the national front, two of the most threatening and repressive pieces of legislation to face the farmworkers were finally defeated in a massive lobbying effo effort on the part of UFWOC and its many supporters throughout the nation.

Bills in both the California and Oregon legislatures were at different stages of be becoming law, when the emergency effort began.

The Oregon bill passed both houses and was awaiting the Governor's signature. This bill called for a 60 day cooling off period during any strike, after which the grower could submit the dispute to binding arbitration. This would enable the grower to harvest the crop, make his miney and then have nothing to talk about because the workers would have no longer been needed. This bill was defeated by putting pressure on Gov. Tom McCall to veto it. He was shocked when his office received over 400 phone calls in one day, which was immediately followed by 600 calls the next day. The calls were running 50 to 1 against the bill. McCall, who has his eye on Mark Harfield's Senate seat, was quite concerned about his liberal image, but had said he would sign the bill. So suprisingly he vetoed it on July 2. The governor said he had never seen such pressure against a measure in 22 years as a state official and political commentator.

Cesar was in Oregon during this time, promising a nationwide boycott of Oregon wood and agricultural products if the bill was signed into law.

In vetoing the bill, McCall said that provisions were judged to be unconstitutional and would in effect "guarantee no organizing of farmworkers in Oregon would occur."

LEGALIZE JUAN CORONAS

The California Bill represented, in effect, a sell-out by the Democratic Party, since it would never had proceeded as far a as it did, without strong Democratic support.
support.

On July 7, at a rally of some 5,000 farmworkers on the capitol steps in Sacramento, Cesar chastised the Democrats "for joining the Republicans in trying to shove this legislation down our throats."

The bill in California was even worse than the Oregon bill as it: prevented bargaining between the union and grower, outlawed the boycott, instituted the labor contractor system (Juan Corona, the alleged murderer of 23 farmworkers was a labor contractor) as law, set up a 5 man, grower dominated Agricultural Labor Relations Board appointed by Governor Reagan, and finally make it impossible for the union to win an election.

National Democratic leaders such as Senators McGovern, Bayh, Kennedy, Cranston, were contacted by phone and letter to let the California Democratic Party know that they were alienating minority groups by supporting this outrageous bill.

Such pressure was mounted that on Tuesday night, before the rally, Assemblyman Cory, the bill's sponsor "killed" his bill.

The next day, Cesar was asked at the rally whether he was celebrating a victory and his response was:

"It's a victory, but its a waste of time, ... we shouldn't have been here in the first place."

"We're holding the Democrats responsible for this. We're upset with them. We've looked to them for over 20 years, and we tried to support them in every way we can."

"And this is the way we're getting paid, and we're sick and tired and not going to take that any more."

"They (the Democrats) should know it right away because our people know it."

Our deepest thanks go out to our friends in Atlanta and in the Southeast who helped lobby against this attempt to crush the farmworkers non-violent movement.

:NOTE:

The Farm Labor Bill, vetoed by Governor McCall may be resubmitted in a special session of the Oregon legislature.

SUPPORT THE FARM WORKERS AFL-CIO

A special thanks to Mr. and Mrs. Elliot Haas for "bailing us out" of an emergency situation.

YOUR TAX DOLLARS AT WORK

Arizona is a "Right-to-work" anti-union state, where "rugged individualists" like Barry Goldwater reign supreme. We knew that these growers would be the hardest to get. Not only do they hate unions (and welfare and "government interference" and taxes and everything else.), but they are also bankrolled to the tune of millions of dollars a year by the government supposedly for NOT GROWING COTTON. Boswell gets $4,091,818 a year; Church gets $229, 638; Martori gets $127,526; and poor little Bodine gets $8,137 (we guess he doesn't grow less than the others don't grow). The new $50,000 limit on subsidies is so full of loopholes it is almost meaningless.

We've been talking with store owners who buy at the Farmers' Market and most have begun requesting UFWOC grapes.

La Tierra Es De Todos Como El Aire, El Agua, La Luz Y El Calor Del Sol. Y Tienen Derecho A Ella Los Que La Trabajan Con Sus Propias Manos. -- Emiliano Zapata

The land is everyone's like the air, water, the light and heat of the sun. And they have a right to it who work it with their hands.

HEUBLEIN GIVES THE FACTS??

HEUBLEIN: UFWOC is using this unfair boycott in an attempt to force unionization of farmworkers employed by 1,700 independent growers from whom Heublein buys wine grapes. It is growers like these with farms averaging 40 acres in size who supply more than 90 per cent of all California wine grapes to all California wineries, including our United Vintners subsidiary, Gallo, Almaden, Christian Brothers and Paul Masson.

UFWOC: Heublein's "1700 independent family farmers" are organized into a coop called Allied Grape Growers. Heublein and Allied Grape Growers formed a holding company, Heublein Allied Vintners, 82% of which is owned by Heublein and 18% by Allied. Heublein Allied Vintners in turn wholly owns United Vintners (Italian Swiss Colony Wines)

Gallo, Almaden, Christian Brothers and Paul Masson have had union contracts with their grape workers since 1967. Heublein workers have been requesting representation by UFWOC since 1967 and have been ignored.

HEUBLEIN: Heublein has no right to force unionization on the independent family farmers or their workers.

UFWOC: We feel responsible for conditions in our society and hold Heublein and every corporation responsible with us. Heublein lives life and makes profits in this society. As individuals and as a corporation they are responsible for the quality of life in America.

They can provide leadership that will bring peaceful change to an industry that has for too long had power over the lives of its workers. They can refuse to buy wine grapes that are not picked under decent union contract conditions.

HEUBLEIN: UFWOC refuses to consent to elections.

UFWOC: We have won all secret ballot elections held in the grape industry. But elections don't improve lives or conditions. Serious negotiations and strong contracts must follow. Heublein has offered elections at 3 ranches out of 1700. (At that rate, it would take 10 years to get contracts. Meanwhile people suffer.)

STAFF

Mike Perna from Duke University joined us for about 2 weeks, but was called to Montreal because of his talent for French. We we re very sorry to see him leave.

We welcome Bill Carmichael of Raleigh, N.C. to our staff. He'll play his guitar if you come and visit.

Things Have Changed ... see page 2

IDEAS FOR HOLIDAY GIFTS ... SEE page 7

THINGS HAVE CHANGED

It all started when Big Apple began prepackaging their produce at the warehouse and people couldn't tell what kind of grapes they were selling. So Mr. McDonald agreed to show us the grapes in boxes at the warehouse, including a tour of their operation and some free samples.

Then one day we got a frantic call from Mr. McDonald. He couldn't find our label on a new shipment of grapes just arrived. So we said we'd check on the grower and call him back. He returned our call first, relieved, because on the second check he found the Union Label, very small, on the side of the boxes. We sure appreciated that degree of committment and concern.

Speaking of phone calls, Colonial Stores phoned a grower in California to send back 300 lugs of grapes that were missing the Union Label on the box. This union grower called UFWOC, California asking them to O.K. the grapes because it was a mistake. Colonial Stores received a telegram from UFWOC, Calif. as well as a call from UFWOC, Atlanta saying it would be all right to accept the 300 lugs of Union Grapes without the label on the box.

Around this time we discovered that some of the chain stores would buy "fill in" grapes from the Farmers Market. So we initiated the "Grape Boycott Alert." Three times a week we survey the Farmers Market and make a list of scab grape labels to be avoided. This list of scab dealers and brands is delivered to the chain store offices.

Upon request, A & P agreed to let us check their coolers. We'd been checking the coolers at A/G Associated Grocers Co-op on and off for a while. So we made cooler checks a regular thing along with the "scab alert".

After our successful "Get Kroger in Line" campaign, we are now checking their coolers.

We appreciate the cooperation of Big Apple, A & P, Kroger, A/G, Colonial and Arlans on carrying Union Grapes for the season.

What is been even more rewarding is the relationships we've developed with individuals within the chain store operations. We salute those people. Communication is the name of the game.

SPARE HOUSE ?

The lease on the good ole! boycott house expires on December 1st. If you know of any houses for rent, please give us a ring. We would need at least a 4 bedroom home, but if you know of ANYTHING let us know.

On the twentieth of October in Seventy One,
Larry O'Brien was not having much fun,
As the Party needed more support
in order to win
And That was the week the UFWOC letters
came in!

Piled high to the sky, on the floors and
the desks,
Every note that he opened mentioned some
guy named Chavez.
Letters from Philly and Boston and Baltimore
Clergy, women, the rich and the poor,
Writing to help farm workers most urgently,
And asking what happened to the Democratic
Party.

If a letter to Larry you did write,
Thanks a million cause IT won the fight.
So UFWOC with few dollars and lots of
friends,
Stood up against the rich grower's might,
And when the vote was taken in committee,
The Harner Bill lost by five to three!

DAVE SINK LEAVES ATLANTA "GOODBYE TO A FRIEND"

By JANE BROWN
Office Secretary
Atlanta Georgia Labor Council
AFL-CIO

Dave Sink of the United Farm Workers Organizing Committee is leaving Atlanta. The National Headquarters in California asked him to go and work with the UFWOC in the Miami area.

Dave is a dedicated Unionist. His father was a Union Organizer in the late 20's and early 30's. So he has had a good background for his beliefs. He was a member for 5 years in the Seafarer's International Union of North America and his salary exceeded $12,000.00 a year. He gave up this and his seniority in the 'Seafarer's' to follow the cause of the Farm Worker and to do his part for them. For this he receives $5.00 a week for himself.

I have met the staff members of the UFWOC in Atlanta and never have I met young people who have come from all walks of life, from all sections of this country, give up so much, unselfishly, for the plight of the migrant farm worker.

Dave has given a total committment to this cause. I ask how many of you could do the same? He has shown me how little I am doing, how much I could do but most of all what I can do right now. I love him as a dear friend and I will miss him. I know wherever he goes he will follow his beliefs as totally as he has done in Atlanta. I wish him success in this new undertaking.

Don't forget about our victory celebration at the Atlanta American Motor Hotel on November 11th. Call us now for your ticket requests. A portion of the proceeds will help pay the many legal fees that we have to meet.

VIOLENCE AT THE FARMERS MARKET

"Stop it" screamed Kathy Mariano as Jerry Ragsdale, a produce salesman viciously struck Joe Mariano with his fists. Ragsdale, who works for Cerniglia Produce Company greeted the UFWOC folk with clenched teeth along with hate and anger in his eyes, when Joe and Kathy were routinely surveying the Atlanta State Farmers Market. With his hands around his head to shield himself from the blows, joe was then pushed and thrown by an enraged Ragsdale, almost completely off the loading platform. When Joe's hurtling body hit against the side of a truck, this prevented his falling off the platform and possibly sustaining more serious damage.

Stunned by the shock and collision with the truck, Joe fell in a heap upon the wet, garbage strewn, concrete platform. The assailant,angered by the lack of response, began to kick repeatedly with his heavy work boots delivering shots to Joe's head, back and kidneys.

The attack only stopped when the rest of the boycott staff sped to the scene drawn by Kathy's screams!

That morning the Vice-President of the Atlanta Labor Council, Bill Cook, accompanied the UFWOC staff on the survey and he along with the others were totally shocked by the ugly picture that was before them.

There was Joe's crumpled form lying on the cold concrete in front of Cerniglia Produce Company, while the other salesmen stood beside Ragsdale, who was pounding a sawed-off baseball bat into his open hand.

"If you come back here-- you can expect more of the same!" snarled another beefy salesman.

"We haven't been able to do business for two days because of all the people calling us!" shouted Ragsdale.

Joe, now recovered enough to answer, pointed at each of the salesmen and said:

"You're making a mistake because we have nothing against you. Our fight is <u>not</u> with you. It's with the growers and those non-union grapes."

At that point, Joe Cerniglia, the dapper owner strolled from the safety of his office where he had viewed the entire assault and exlaimed:

"You all had better get out of here!"

Joe responded:

"You are well aware, Mr. Cerniglia, the human misery those scab grapes represent, and that our fight is not with you!"

"I'm just trying to run a business and make a profit." Cerniglia said.

Then Kathy asked:

"Do you condone this violence Mr. Cerniglia?"

"I can't control what my men do!" snapped Cerniglia as he glared at the diminutive Kathy.

After this vicious attack, the farm worker staff concerned about the potential escalation of violence at the Farmers Market got a delegation of local labor leaders to see State Commissioner of Agriculture, Thomas Irvin, as his office is responsible for leasing the stall space at the Market.

Although the atmosphere at the present time seems to be less tense, the powerful presence of non-violent soul force has created a necessary tension which Dr. King best described:

"Injustice must be exposed, with all the tension its exposure creates, to the light of human conscience and the air of national opinion before it can be cured."

HOW TO GET TO HEAVEN

It seems that Cerniglia had indeed been hiding his true feelings about injustice and his handling non-union grapes, as was shown in a phone conversation with the boycott coordinator back in June.

"I'm just a businessman, caught in the middle. I really don't want to take sides or hurt anybody. Don't tell me about my Church's (Catholic) involvement with the farm workers -- I think that's misguided -- they can tell me how to get to heaven -- but <u>not</u> how to run my business!"

When Joe Cerniglia began receiving many, many phone calls from UFWOC supporters who were demanding to know why he was supporting grape growers who were fighting the farm workers, by selling their grapes -- his response "That non-union stuff was sent to me by accident"

When the numerous phone calls began to interfere with his profit making, Cerniglia finally exploded, vividly stating his position in words and deeds.

Phone calls were made to the boycott office warning the staff about their personal safety at the market and also mentioning threats to Father John Mulroy of Sacred Heart Roman Catholic Church. (Fr. Mulroy, who was active two years ago in the grape boycott was probably thought to be still involved with UFWOC. Cerniglia had changed his parish over the last boycott, Ironically, Fr. Mulroy was in Spain during this time)

continued on page 4

PROFITS BEFORE PEOPLE, continued

In a phone conversation with a UFWOC supporter, after the beating Cerniglia shouted:

"They're hoods!"
"This has been going on for five years!"
"Cesar Chavez is a farce and the farm workers don't support him!"
"I don't care what kind of grapes I sell or what kind of conditions they're picked under!"

Reflecting on the problems of the boycotters at the Market, Joe Mariano said:

"The violence at the farmers market is a microcosm of our society. The dealers have felt their whole value system threatened. So their response has been bullets, beatings and bad mouthing. As Cesar has said 'Men who practice injustice and who live in fear believe that they can accomplish all things by making other men afraid.'

Men like Joe Cerniglia and Jerry Ragsdale are not to blame for their actions for they are victims of a system that they themselves help to perpetuate - a system that degrades all human life.

Only by responding to this system with active non-violence can justice be attained.

MUCHAS GRACIAS

We would like to thank all of the folks who have responded to the needs of the Farm Workers and UFWOC, Atlanta since our last newsletter.

KROGER CAMPAIGN

Fred Herzog of Kroger's Produce Department told our office here that:
"Kroger intends to handle Non-Union Tokay Grapes"

BOYCOTT KROGER CAMPAIGN RALLY & PICKET

CONSUMER PHONE CALLS CONCERNED STORE MANAGERS

PICKET LINES BOYCOTT

****A GOOD SHOW OF STRENGTH MAY CHANGE KROGERS MIND****

IT DID

Before Fred Herzog had time to order more scab grapes, his office and warehouse were being picketed, his store managers calling in and his switch board was deluged with phone calls of irate consumers calling complaining of Kroger's Scab Policy.

Seventy-two hours after the initial Policy announcement and after a vacationing Vice-President had been contacted about the policy change, Mr. Herzog called us to say "Kroger would carry ONLY Union Label Grapes and had instructed his buyers to that effect."
It still remains a mystery as to what EXACTLY prompted Kroger to recognize their corporate responsibilities to poor people, but none the less this confrontation is a good example of the strength of the Boycott and Consumer Power in bringing about Farm Worker Justice.

Muchas Gracias

THROUGH THE GRAPEVINE

Remember.....all Tokays are non-union. They are hard to tell from regular red grapes. To be sure, look for the Union Label before you buy any grapes. We would like to thank those people who were able to help us by doing store checks.

WHAT ABOUT LETTUCE?

Negotiations have been going on since May but may soon grind to a halt. As long as these negotiations continue, we will not picket "scab" lettuce. However, we would remind you of the deadly poisons (aldrin; parathion; 2,4-D; DDT) that non-UFWOC lettuce contains.

With this fact in mind and also that of the destitute farm workers, REMEMBER, DEMAND TO SEE THE UNION LABEL BEFORE BUYING LETTUCE.

THE GRAPES OF WRATH & THE SWORD OF TRUTH

NOTE:

On June 28, 1971, Jerry Harmon, a produce trucker at the Atlanta State Farmers Market, pulled out a 38 caliber pistol and angrily fired six bullets into the car driven by Kathy Mariano, who is with the United Farm Workers. Farm Worker representatives who are conducting a boycott of non-union grapes in the Atlanta area were assaulted as they were following trucks to find out which customers were receiving the non-union produce. That same day, Harmon was arrested by Clayton County Police on a warrant which charged him with aggravated assault. On October 26th the trial of Jerry Harmon began and immediately was turned into a vicious attack upon the farm workers movement and the victims of the shooting incident. The bizarre and vicious events following the shooting are proving to be an emerging pattern of lies, intimidation and violence, which are very difficult to believe but nonetheless recounted below as they actually happened.

Ed Wallace is physically a big man with an intimidating presence. His black, slicked back, curly hair and small beady eyes are the first things one notices about him. The first thing one instinctively feels about the man is the hate that he radiates in his glares and sneers. Its the same kind of 'hate-stare' reserved for Black folk who are too uppity or don't know their place in the white racist society.

That sneer was on Ed Wallace's face when he stood up in the Jonesboro courtroom glanced at the Farm Worker staff, turned to the Clayton County Superior Court Judge and said:

"Your Honor, I would like to know what happened to the cases that were read off yesterday, specifically the aggravated assault case against Jerry Harmon? I would like to get the trial going to clear Jerry Harmon's name!"

Judge Harold Banke, somewhat taken aback at this interruption so early in the morning while other cases were being disposed of, snapped back:

"Mr. Wallace, you will refrain from making comments in open court because as you well know the perspective jurors may be in this courtroom and if you make such a statement again - I'll hold you in contempt of court!"

Eating humble-pie, defense attorney Wallace chirped:

"Your Honor, I'm sorry but you have to understand that I've become so personally involved in this case that I get emotional."

"But Mr. Wallace, an attorney should remain objective and not become personally involved with his client and the case." interuppted Judge Banke.

"As you will see your Honor, because of the nature of this case, it is impossible for me not to become emotionally involved. Would you say Mr. Harmon, that you are satisfied with the job that I have been doing in representing you?"

At that, Wallace turned to sneer at Kathy, and co-plaintiff, Mark Walton and then sat down.

The boycott staff saw this exchange as a sign of optimism in the Judge's attitude while a dark shadow was also revealed in Wallace's words 'nature of this case'. The selection of the jury was also a harbinger of gloom as the main question asked by Mr. Wallace of the candidates was: "Have you ever served in the armed forces of this country".

The actual trial was a physical and emotional strain on the boycott staff as the absurdities began to unfold during the testimony.

STOKELY, RAP AND MAO-----?

Wallace tried to introduce the paper-back Little Cesar into evidence. (Little Cesar is a vicious, right-wing hatchet job upon Cesar Chavez and the United Farm Workers, which is full of malicious gossip and unchecked rumors. Anthem Books, the publishers are a front for the anti-union National Right to Work Committee and the author Ralph deToleando is a propagandist for that group.) Assistant District Attorney Jim Bradley thwarted that effort to admit the book into evidence by producing a stinging review of Little Cesar by Monsigneur George Higgins of the U.S. Catholic Bishops Committee on Farm Labor.

Wallace persisted in reading from the book and formulating questions to the witnesses, such as these when Joe Mariano was on the stand.

Wallace:

"Do the following groups or people support your group? The Black Panther Party, SDS, Weathermen, Progressive Labor Party, Stokely Carmichael, H. Rap Brown and Ethel Kennedy?"

Mariano:

"No, with the exception of Ethel Kennedy, because I know she went to Salinas to visit Cesar when he was imprisioned."

However, the most insidious incident in the trial was the admission into evidence of the book: Quotations from Chairman Mao Tse Tung.

Defense attorney Wallace claimed that Joe Mariano, The UFWOC coordinator had dropped the book at the preliminary hearing and was picked up by Wallace in exactly the same area where the UFWOC car was parked.

Wallace then produced two witnesses that swore they saw Wallace find Quotations from Chairman Mao exactly where he said he did. The best was yet to come.

Recounting this experience, astounded Joe Mariano exclaimed:

"When Wallace asked me on the witness stand if I had ever seen this book before, I just couldn't believe this fabrication, as I had never seen this book before in my life! Since immediately I knew I had never seen this book before or had even ever owned a copy of Mao, I pursued it rather quickly and said I didn't recognize this book. But Wallace persisted that I examine it more closely and when I did -- Wow! I was really shocked! Inside the fly-leaf was an inscription which said: 'TO JOE AND KATHY' then some quote from the book, which I don't remember, and WITH BEST REGARDS, and signed with the initials C.C.! I was outraged by this blatant lie and the manufactured evidence."

"To top it off", Mariano continued, "I later told the D.A. that the handwriting did not resemble Cesar's and he (the D.A.) said; 'why didn't you say something before this?' I still am fuming at that, after all, am I the legal expert?"

DISGUSTING!!!

Walace's summation speech to the jury was a masterpiece in fascist rhetoric and symbolized the hatred, unjust and deceitful nature of this trial.

Wallace:

"Ladies and gentlemen, at first I thought this was going to be just another simple case of aggravated assault, but as I began to dig deeper, I became frightened at what I had found. There is a battle going on all across the United States, a battle to drive the samll businessman down and out of business. The battle extends from the grape arbors of California to Clayton County, Georgia and if they (pointing to Kathy, Mark and Joe) are allowed to attach the small businessman, (walks over to flag, touches it) they'll drag this down next! (At this point, Wallace excuses himself so he can regain his composure because he claims he gets emotional each time he talks about it) The small businessman is the back-bone of America, takes the brunt of taxes, works hard and pays his own way. These people are trying to whip the little guy into line so the big ones will just follow.

You are part of the silent majority, but its time to stand up and be heard. Mr. Jerry Harmon gets up at 3:30 in the morning to put bread on his family's table. His fine wife and two fine boys depend on him and his hard work. I've always maintained that idle hands are the Devil's workshop and sitting right there are three pair of idle hands. (Points us out in the audience) Jerry Harmon was bothering no one, just trying to survive in the business world, and these people hounded him day and night. (Hands jury pictures of a picket line outside of a store which is supplied by Harmon) When I was a little boy I went hunting rabbits with my uncle and we had let the pack of hounds out after the rabbit. I asked my uncle: 'Uncle Boots, aren't the dogs faster than the rabbit?' 'No,' he said, 'because the rabbit is running for his life and the dogs are running for sport!' So I say to you Jerry Harmon is the rabbit, running for his life, pushed into a corner. He said he would get union grapes, but they still wouldn't let him alone because that day they were unavailable, they still followed him. There they sit, the hounds! Running for the sport of it!

Another thing is that when your country calls you to service, any one who refuses to serve (Mark is a CO) is the lowest form of life to crawl across this terra firma. (He hands Jerry Harmon's discharge papers to the jury) Every man will stelp forward to answer that call to duty. Now what would you do if you were Jerry Harmon? He did the only thing he could to defend his business; he shot, not at Kathy or through the windshield, but he assaulted the tire! These people are spreading the seeds of discord and hatred throughout the country. Now about this non-violence. That sounds nice, but it never turns out that way! I suppose the students who rioted and demonstrated at Kent State were non-violent! I suppose H. Rap Brown, Eldridge Cleaver, and Stokely Carmichael were all non-violent too! (Shows jury picture of one of Jerry's trucks with a flat tire) Thats non-violence but we can't prove that those people did that! (Wallace takes Quotations from Chairman Mao, opens to an underlined passage and reads) 'Political power grows out of the barrel of a gun! (He slams book shut and bellows:) Disgusting! (He looks at the Farm Workers, hands book to jury and bellows again;) DISGUSTING! (Wallace turns to jury with his voice cracking and sobbing out) If you don't do something now, we're gonna get taken!

I hope that today October 27th will be the day that citizens in Clayton County stood up and were heard to the grape arbors of California. Let the message be clear! (Wallace turns to Joe Mariano and points a finger at him) And I hope that Cesar Chavez get that message Mr. Mariano; that Ed Wallace took a stand in the arena and armed with the sword of truth, fought for justice; and that sword will destroy you! (Pointing at Joe Mariano)

One hour and fifty minutes later, the twelve jurors returned to the courtroom and announced that Jerry Harmon was NOT guilty of aggravated assault. As the crowd of Harmon supporters filed out of the courtroom, one of them turned to Joe Mariano and said:

"You better go pick your grapes up North, boy. Don't you know you can't get a conviction down here in Georgia?"

In our last newsletter we told you that the judge was delaying the ruling on the legality of the Heublein boycott. He has yet to rule on this point.

HELP

Here is a way that some of you may be able to help.

The following is a list of our average monthly expenses:

Rent.....$150.00
Food..... 125.00
Phone..... 75.00
Utilities..... 50.00
(gas,water,electricity)
Postage..... 100.00
Allowances..... 125.00
($5.00 per week per full time volunteer)
Transportation..... 125.00
(gas, oil, repairs for 3 cars)

Total.....$745.00

If you or your group can take care of all or part of one of these expenses, please call us at 622-6296

HOUSE HOLD NEEDS

An Alarm Clock
A Wall Clock
Food (dry, canned, frozen)
Chairs (kitchen type)
2 Large Mirrors
Pots (2 quart size)

CLOTHES

Socks
Gloves
Shirts
Pants
Work Shoes

TIRES

5.80 x 15
6.00 x 12

THINGS TO READ

There are several informative and enjoyable books that have been written about the farm workers struggle. From the early days of the Delano grape strike to the exploitation of child labor. We only have the ones marked, but think that you will find good reading in all of them.

Sal Si Puedes, Cesar Chavez and the New American Revolution, by Peter Mathieson (Paper Back)

So Shall Ye Reap. The story of the Farm Workers Movement and Cesar Chavez, by Joan London,

Forty Acres, by Fr. Mark Day

Huelga! The First Hundred Days OF THE GREAT DELANO GRAPE STRIKE, by Eugene Nelson (Copy available here)

Child Labor in Agriculture, Summer 1970 A special report by American Friends Service Committee (Copy available here)

Migrant and Seasonal Farm Worker Powerlessness. Hearings before Sub-committee on Migratory Labor 91st Congress- June 9, 1961 to July 24, 1970 (16 books available here)

Fourteenth Report Un-American Activities in California, 1970. State Senate of California sub-committee on un-American activities. (copy available here)

MORE BOOKS

If anyone knows the mechanics of running a large book sale, Please let us know. We have an unlimited number of hard-backs and paper-backs at our disposal. Over 20,000 books. Most we'd sell in $.10 to $1.00 price range. Contact Mike.

Have you seen Migrant??? Call us about showing this film.

ATTENTION:

BUTTON & POSTER FREAKS

Please see us for your Christmas needs. We have them all from 'Viva la Revolucion' to 'Boycott the Hell Out of Them' Most complete selection in the South. The prices are fair with all the money going to la Causa.
Also, we have a few eagle tie tacs left. And with all those ties that you'll be getting, I'm sure that you will be able to use it. Or compliment the tie you are sending with this attractive pin. Great to give! Great to get! Check them out, please.

This Land is Their Land

"Welfare *is* a problem for taxpayers—welfare for the rich. In a recent year 500 large growers in California's Imperial Valley received $12 million in farm subsidies—or $24,000 each. Meanwhile 10,000 poor, landless residents of the Valley received less than $8 million in welfare payments—or $800 each. George Thayer, a California almond grower, told the committee: 'I believe we have created the worst welfare system of all times—the welfare system for the corporate farm.'"

The wheat field is ten miles long. There's a machine – one colossal machine – harvesting the wheat, rumbling toward the setting sun on tracks which keep it from compacting the soil. A helicopter sprays pesticide on the adjacent soybean field. Another helicopter circles, scanning crop conditions, transmitting data to a computer. Two men sit in a bubble-topped control tower, watching the instrument panels which surround them. The lengthening shadows of three giant skyscrapers—skyscrapers filled with cattle—fall on the men. In these nearly fully-automated structures they (the cattle) are fed various chemicals, fattened, killed, processed, and packed into cylinders for shipment by monorail to the Cities, which are, presumably, where all the people are.

THIS IS A PICTURE OF THE AMERICAN farm in the year 2015, as sketched by U.S. Department of Agriculture (USDA) specialists. To them it is irresistably appealing: ten whole miles filled with great amber waves of grain. Yet the implications of their vision are chilling: environmental ruin, nutritional famine, wrenching social dislocation. Who will own this futuristic farm? What will be its economic and environmental costs, and who will pay them? The government's crystal-gazing agronomists cannot be relied upon for answers. But already, at every link in America's economic food chain, vast transformations are at work which provide some exceedingly disturbing clues. We can begin with an implausible assertion and a surprising fact.

by Larry Casalino

"In California less than one tenth of one percent of the farms own 40 percent of the cropland. Tenneco also has vast landholdings in Arizona—altogether it controls a land area more than twice the size of Rhode Island."

(1) When we think of land reform, Asia and Latin America immediately come to mind. Things like the break-up of enormous "latifundistas" in steaming banana republics. Most of us think that such land reform is generally a good idea. But what most people would find pretty hard to believe is that the indispensable condition of sound agricultural development in America is land reform – right here in the fields of California, Mississippi, Maine. But consider this: (2) if you are the "average American," you eat a *less* nutritious diet today than you did ten years ago. (The Department of Agriculture admits this.) Only one-half of American families have "good" diets by USDA standards. How many more years of this kind of progress can we afford? The fact is our thinking about large-scale concentration in the economy of food has been dominated by the wrong agricultural cliche: it is not reaping the benefits of efficiency; it is sowing the seeds of disaster.

The general trend towards control of our food and land by a number of large "agri-business" corporations has received a certain amount of attention. But considering that the "food and fiber" industry is America's biggest business—accounting for almost a third of all private employment and nearly a fifth of the entire GNP—agri-business has managed to arouse very little interest and debate, much less serious opposition. Indeed the process of concentration has been so swift that there is remarkably little awareness of just how far it has already gone.

By 1958, the U.S. Food Marketing Commission classified 80 percent of the food industry as being under "oligopoly" control. Some samples: 95 percent of all prepared soups are sold by Campbell Soup, four corporations make 85 percent of American breakfast cereals.

On the farming end, in 1969 just 2 percent of U.S. farms made 30 percent of all farm sales, and 5 percent made more than half. One percent of U.S. feedlots now handle 52 percent of our beef, and 90 percent of all broiler chickens are bought up by five companies.

Food corporations continue to swallow up direct competitors, extending their "horizontal" expansion (as when one retail store is taken over by another, or a canner by a canner). But, even more significant, they are striving for "vertical integration," "total food systems" which encompass every step from farming through processing, distribution and retailing. And in recent years, huge conglomerates (like Greyhound, ITT and Tenneco) have been heavily diversifying into the food industry—particularly into farming.

Tenneco, roughly the 30th biggest U.S. industrial corporation, although a fairly new entry into agri-business, could be considered the vertically integrated food corporation *par excellence*, with its stated aim of controlling food production "from seedling to supermarket." In 1967 Tenneco acquired Kern County Land Company, California's third largest landowner. Three years later it took control of Heggblade-Marguleas, the nation's largest marketer of fresh fruits and vegetables. Tenneco also owns J. I. Case Co., which manufactures, among other things, farm machinery, and the Packaging Corporation of America, which manufactures food containers.

So Tenneco plows its own land, fertilized and sprayed with chemicals from its own chemical division, using its own tractors fueled with gas and oil from its own oil wells and refineries. The food is processed, packaged, and distributed by Tenneco subsidiaries. Tenneco is presently attempting to develop its own national brandname (Sun Giant) for produce, which it intends to sell at "premium prices." Tenneco doesn't have its own supermarket chain yet. Unlike traditional farmers, when Tenneco needs capital it can look to its other operations for help: Tenneco is also busy searching out oil off the coast of Southeast Asia and is the world's largest transporter of natural gas, building two nuclear-powered aircraft carriers.

Most Americans are not farmers, and probably never get much closer to the source of the food they eat than the deep freeze department at the supermarket. So for them, if agriculture has been replaced by agri-business, what real harm is done?

To begin with, there is the habit agri-business has of slipping poison into one's dinner. As we now know, much of the food these corporations supply has had much of the taste and nutritional value processed out, and has become a witches' brew of potentially harmful chemicals which have been processed in. So that many people find shopping in the supermarket a queasy balancing act, selecting the least deleterious diet they can from alternatives that range from U.S. meat, already banned as unsafe in twenty-one more scrupulous countries, to "fresh" fruits and vegetables which are picked before ripe, then waxed, gassed and injected with implausibly vivid dyes.

Highly processed foods are the hard-sell specialties of the agri-corporations. The use of chemical food additives, part and parcel of the rise of agri-business, has risen from a minor phenomenon thirty years ago to become a $500 million a year business in its own right. It is hardly a secret that, as one marketing spokesman enthused, "The profit margin on food additives is fantastically good—much better than the profit margin on basic traditional foods." Every reader of Sylvia Porter or *Consumer Reports* knows that the more intensively processed, synthesized and "convenienced" a food, the more exorbitant its price. But processed foods are not only a source of profit to their parent companies; today's giant food corporations simply *could not exist* without them.

Wonder Bread may not be the best for you—although you can store it forever, mail it to a friend, squeeze it 'til you can hold a loaf in your fist – but it sure is convenient for IT&T, which owns Continental Baking. It is the heavy doses of chemical additives that opened the

way for a handful of powerful corporations to centralize control of food markets in the United States. Chemicals make it possible to stabilize color, texture and other illusions of freshness during the extended storage and transport involved in wide regional and national distribution. Previously food markets had been localized and fragmented by the very nature of the simpler farm-to-table foods. Besides being perishable, they were undistinctive, unpatentable, effectively unbrandable. They provided no basis for the packaging, distribution and promotion involved in national market exploitation.

Along with additives, agri-business has brought an upsurge in pesticide use, which has more than doubled since Rachel Carson's *The Silent Spring* was published in 1962. Large agricultural corporations (which often have their own holdings in the farm chemical business) are totally geared to large-scale farming methods that depend on disproportionately larger amounts of pesticides and inorganic fertilizers. They are firmly locked into the familiar vicious circle: extensive use of monoculture (using a field to grow a single crop without rotation), pesticides, and inorganic fertilizers, which together have increased the variety and resistance of pests and impaired the quality of the soil, so that ever greater amounts of even more toxic and costly chemicals are soaked into the land. Agri-business corporations decidedly are uninterested in alternatives like organic fertilizer and biological control of pests. And they are in a position to make their lack of interest count. As a National Agricultural Chemicals Association spokesman candidly points out: "There really is not much biological control in industry research; they would research themselves right out of the market."

Among the many social costs of agri-business concentration is its effect on the prices people pay for food. In areas such as breakfast cereals where concentration is far advanced, its inflationary effect is already very clear. And continued growth of agri-business concentrations sets the stage for inflated prices throughout the industry in the future, when the market will be dominated by sufficiently few "competitors" to make possible what is euphemistically called "administered pricing"—in other words the kind of price fixing, both tacit and conspiratorial, that has long prevailed in other highly concentrated industries.

But the question of food prices is problematic in other ways. For instance, when people switch to high-priced processed foods which are often made from cheap imitation ingredients (soy protein for meat or milk), are they paying more for their food or getting more for their money? A large part of what we pay for food goes for such things as advertising, which is neither edible nor convenient. In fact, the food industry spends more on advertising and less on research than any other industry in America. Betsy Wood, of the Consumers Cooperative of Berkeley, estimates that consumers pay 15-25 percent more for national brand names—an average family would save $200 a year buying local labels. Are the taxes we pay that go to finance agri-business (in the form of subsidies, credits and special allowances) part of the price we pay for food? And when you consider the poisoning of our bodies and our environment, or the brutal exploitation of farm workers, it's even more difficult to count the cost.

"Large agricultural corporations are locked into a vicious circle . . . which has increased the variety and resistance of pests and . . . has caused greater amounts of toxic chemicals to be soaked into the land."

The most direct cost of agri-business power is that it prospers at the ruinous expense of the great mass of American farmers. For them the situation is desperate. Half the farms in America had gone out of business by World War II, and shutdowns continue at a rate of 2000 farms a week. The Department of Agriculture admits that the number of American farms remaining by 1980 may be reduced to less than a tenth of what it is today.

IT MIGHT SEEM REASONABLE TO conclude that the ability of agri-business to overwhelm the smaller traditional farmer demonstrates the superior efficiency of its large-scale, integrated mode of operation, and that we are seeing an outmoded economic unit, no longer able to compete, replaced by a more advanced form of organization. Thus, we might sympathize with those who are displaced and perhaps attempt to soften the blow, but to try to turn back the clock would be merely sentimental and quixotic.

At any rate this is what agri-business would like us to believe. In reality the big corporations have not prevailed by their farming competence which is dubious at best. What has happened is that agri-business, being more efficient at farming the American people than at farming the soil, has been able to draw upon a fascinating array of lucrative subsidies, which the smaller traditional farmer did not enjoy, and against which he has been unable to compete.

At least five major subsidies have combined over the years to give its economic edge:

THE CROP SUBSIDY

In January this year Senator Adlai Stevenson III's Senate Subcommittee on Migratory Labor conducted three days of hearings in San Francisco and Fresno. Over and over the Senator heard the same basic complaint: "My government taxes me to the extent of confiscation to subsidize and create favorable conditions for vertically integrated corporations," said Gus Stamenson, for 26 years a grower of almonds and walnuts on 40 California acres. "Give me a $4 million dollar subsidy and I'll be the most efficient farmer west of the Mississippi."

Ronald Reagan, Richard Nixon, and other politicians throughout the country have been very successful in persuading people that welfare is a major problem. They never mention the fact that federal crop subsidy programs cost the taxpayers more than all federal, state, and local

welfare programs combined. In 1970 Tenneco received crop subsidies of over a million dollars. California's J. G. Boswell, one of the world's largest cotton growers, received $5 million.

Welfare *is* a problem for taxpayers—welfare for the rich. In a recent year 500 large growers in California's Imperial Valley received $12 million in farm subsidies—or $24,000 each. Meanwhile 10,000 poor, landless residents of the Valley received less than $8 million in welfare payments—or $800 each. George Thayer, a California almond grower, told Stevenson's committee: "I believe we have created the worst welfare system of all times—the welfare system for the corporate farm."

THE WATER SUBSIDY

Last summer the Ralph Nader-originated Center for the Study of Responsive Law published a massive, thousand page study titled *Power and Land in California.* The study blasted the California State Water Project as "possibly the largest special interest boondoggle in history." It claims that, when finished, the project will have cost roughly ten *billion* dollars—$500 for every man, woman, and child in California. Yet economists estimate that the project will return only 50 cents of benefit for every dollar it costs!

Why build such an economically irrational project? Well, some folks do benefit from it a great deal—large landowners, large water-using industries, and developers. A 1959 study by the California Labor Federation reported that eleven landowners including Southern Pacific, Tenneco, and Standard Oil owned 33 percent of the land to be irrigated by the project. Southern Pacific and Tejon Ranch were the biggest donors to the successful 1960 campaign to persuade California voters to approve a bond issue to finance the project. And Bank of America is the biggest holder of the bonds.

The water is a speculator's dream. It raises land values by at least $300 an acre. So, if you own 20,000 acres, your land is suddenly worth $6 million more than it was before California citizens built a water project for you. And the taxpayers pay about half the cost of the water, so you can irrigate your crops much more cheaply.

Agri-business could have tried getting irrigation water even cheaper by pressing for a comparable federal water plan. They were deterred from that route because there's a catch—the federal 160-acre limitation.

This law would go far toward breaking up the large corporate landholdings. But the law has, from the beginning, been flagrantly violated. Jack Henning of the California AFL-CIO estimates, on the basis of his organization's research, that 900,000 California acres held by owners who own over 160 acres are receiving water from the federal Bureau of Reclamation. Among these owners are the old familiar names—Tenneco, Southern Pacific, Standard Oil.

THE RESEARCH SUBSIDY

The University of California's Agricultural Extension Service was originally founded to provide easily available local technical assistance to small farmers. Late in 1971 David Talamante of the Tri-County Economic Development Association approached his local Extension "Service" for assistance for a Chicano cooperative which grows strawberries in greenhouses. Talamante was laughed at and told: "If you want to do that kind of farming, why don't you go to Guam?"

This attitude is typical. Nearly all of the more than $20 million a year of state and federal tax dollars spent by the University of California on agricultural research are aimed at aiding the biggest farms. Some of the University's most brilliant inventions have been machines, like the tomato harvester, which allow corporate farms to dispense with troublesome farm workers. In the bitter grape strike of the late sixties, the University came to the growers' assistance during pruning season and allowed them to use a pneumatic pruning machine it had under development.

The situation is simple: we pay the University of California for technological development deliberately skewed in favor of large corporate farms. Then we are told that it is technology that makes corporate takeover of agriculture inevitable.

THE LABOR SUBSIDY

American Indians were the first to toil as farmworkers in the fields of California. They were followed by Chinese (who were 90 percent of farmworkers in the 1870s), Japanese, Filipinos, and, today, Chicanos. Jack Hanna, one of the developers of the tomato harvester, observed: "I'd seen nationality after nationality in the fields, and I felt that someday we might run out of nationalities to do our hard work."

Farmworkers, who have fed us for many years, are the least protected of all workers by federal and state labor laws. They have no protected organizing rights, and cannot insist on union representation elections or collective bargaining. The government has actively intervened to obstruct the United Farmworkers Organizing Committee's attempts to organize farmworkers. For instance, the Defense Department more than tripled its purchases of lettuce from Dow Chemical subsidiary Bud Antle during the UFWOC lettuce boycott.

Thus the government helps to provide big farmers with a cheap, easily exploitable labor force. Seven percent of California farms hire 75 percent of the state's farm labor. The larger the farm, the more labor the farmer can exploit, thus cutting costs of production and raising profits. The small farmer has no one to exploit but himself, in competition with $1.50 an hour wages paid to many farm laborers. And taxpayers pay the welfare costs of keeping farm laborers alive between seasons of peak work.

THE TAX SUBSIDY

There are numerous tax breaks in the IRS cookie jar that may be of benefit to any knowledgeable farmer. The important edge obtained by diversified corporate farmers comes from a number of special tax breaks that enable money expended in farming operations to cancel out substantial amounts of otherwise taxable profits from an owner's *non-farming* operations. Since the old-fashioned farmer doesn't have any significant non-farming profits, this is of no use to him. But to agri-business companies, which operate in many non-farming industries, this kind of tax shelter has proved extremely lucrative.

In the past couple of years reform moves have been made to curtail the special tax breaks (as well as the in-

Illustrations by James King

equities) in the crop subsidy program. But corporate ingenuity has found ample loopholes remaining in both these areas through which to make its way. There is little evidence that they have suffered much more from these reforms than the inconvenience of devious legal maneuvers.

[THE MYTH OF AGRI-BUSINESS EFFICIENCY]

THE FACT IS, GIANT FARMS are *not* more efficient than small farms, even in a strictly economic sense. The government's own studies conclude that all of the economics of size can be achieved by modern, fully mechanized, one- or two-person farms ranging from 100 to 600 or sometimes to 1000 acres, depending on the crop (see Ag. E. Report No. 107, Economic Research Service, U.S. Department of Agriculture). It's worth remembering that "inefficient" family farms have been producing national food surpluses for decades.

Concern for small farms is not nostalgia for the past – it makes economic, political, social, and ecological sense. We have been taught to assume without thinking that big and powerful equals efficient and good. The demise of small farms has profound effects on both urban and rural America. As 2000 farm families a week leave their land, local businesses, schools, and community groups shut down. More people crowd into the cities (75 percent of Americans now live on 2 percent of the land), where they will be dependent on big agri-business corporations for their food (and possibly for their jobs, housing, etc.). As large landholdings replace family farms, and the cities become even more crowded, rural communities turn into company towns. A 1944 study by anthropologist Walter Goldschmidt compared two farm communities in California's San Joaquin Valley, Arvin and Dinuba. Arvin was characterized by large landholdings, Dinuba by family farms. The differences are striking: The majority of workers in Dinuba were self-employed, while two-thirds of the workers in Arvin were agricultural wage laborers. Dinuba supported twice as many independent businesses and did 61 percent more retail business. Dinuba had many more parks, schools, and community groups, as well as more institutions for local political decision-making.

Goldschmidt originally planned to extend his research to include all farm communities in the San Joaquin Valley, but a vigorous campaign, spearheaded by the powerful Associated Farmers, forced him to discontinue his work. To this day, no follow-up study has been done – it's difficult to get research funds to look into the American power structure. But it seems likely that comparable study today would yield even more striking results.

In California, by far the nation's leading agricultural state, less than one tenth of one percent of the farms own roughly 40 percent of the cropland. Tenneco and Standard Oil each own over 300,000 acres of California land–much of it agricultural. Tenneco also has vast landholdings in Arizona–altogether it controls a land area more than twice the size of Rhode Island (it actually *advertises* this in its annual report).

Southern Pacific is California's biggest landowner with 2.4 million acres, about 150,000 agricultural (originally given to it free by the government to build a railroad). Other big California "farmers" include the 348,000 Tejon Ranch (with a big interest held by the *L.A. Times-Mirror*) and Kaiser with 111,000 acres. In the early 1940s California's largest agricultural landholder with over 600,000 acres was the Bank of America, which had foreclosed on a farm a day during the preceding depression years. Today the Bank of America, the world's largest agricultural lender, works closely with big corporate farmers while frequently refusing loans to small farms, thus giving another non-agricultural impetus to corporate control of the land.

California is only the most important example of the need for land reform in the United States. The situation varies somewhat from region to region – in the deep South landholdings are highly concentrated, in Maine 12 corporations own 52 percent of the land, in the Midwest things are not yet quite as bad. But everywhere the pattern is the same: land, whether agricultural, timber, urban, is increasingly controlled by big corporate interests.

[LAND REFORM IN AMERICA]

THE KIND OF CONCENTRATED control of such basic resources as food and land vastly increases the power of a few corporations over the lives of millions of people. Most of us are alienated from the land–unlike most people who have ever lived, we've pretty much forgotten about it. But there is no more basic resource, none that on as many levels–physical, social, and spiritual–so critically determines the dimensions of human life. And the corporations own it.

Land reform does not just mean a return to small farms. It means a radical restructuring of society. Corporate control of land helps force people into the cities and keep them there. Think for a moment about the vast changes in U.S. society if 75 percent of the people did *not* live on 2 percent of the land–you begin to get an idea of the profound implications of land reform. A certain traditional might suggest that the alternative to the USDA farm of 2015 is for "the people" to "take control" of the same ten mile wheat field and the skyscraper cattle factories. But the people can never control such things, which inherently centralize power and which point to a world of Super Cities worse than we have today. Ultimately, land reform should not just mean opening the land up for people who want to farm, but opening it up for everyone, for communities of farmers *and* carpenters, poets, printers, teachers, tailors, plumbers, jacks-of-all-trades. It should mean a decentralized society, in which the countryside is an attractive, healthy place where people live and work, where people are able to obtain and make use of simple, durable tools and machines, and build regionally a substantial self-sufficiency and independence. If we are really serious about having a direct say in decisions which affect our lives, we will first have to take the basic organization of our society out of the skyscrapers and bring it down to earth.

FARM UNION STRUGGLES FOR SURVIVAL

by

Vernon E. Jordan, Jr.

If there is any single union in America that best exemplifies the crusading ideals that built the labor movement in the bitter 1930s, it's the United Farm Workers Union, led by Cesar Chavez. Now, less than two years after winning union contracts for California grape workers, the union is in a life-or-death struggle for its very existence.

The United Farm Workers is made up of the poorest and most oppressed of America's workers. It started among the Mexican-American and Filipino farm workers of California, many of them illiterate, most of them migrant workers who never had the protection of a union contract before, and all of them desperately poor.

The union came into national prominence through its long struggle with the grape growers. The main weapon in that struggle was the boycott. A strike of farm workers could not succeed by itself. Growers could chase strikers off their land and hire other migrant workers, many of whom were never aware that they were being used as strike-breakers.

But the whole country was inspired by the brave efforts of Chavez's small band of unionists and the boycott of grapes spread. People refused to buy grapes picked by non-union workers and the growers finally signed a contract with the union. That struggle, and Chavez's inspiring, almost saintly, personality, won a warm place in the hearts of the country for the farm workers.

The grape contract was followed by other successes, including a well-publicized union contract with big growers of citrus fruits in Florida, where many of its members are poor blacks. Although farm workers are not covered by laws protecting union organizing, the UFW was well on the way to success.

Now the union is locked in battle with the iceberg lettuce growers in California's Salinas Valley, and once more it is pinning its hopes on a nation-wide boycott for victory. But this time there is a terrible possibility that not only will the union lose, but that it may even be driven out of existence. And the

...more...

reason is that it is not only tackling the wealthy growers, but this time the weight of the federal government's power is coming down against the farm workers.

The National Labor Relations Board has asked for an injunction against the union, preventing it from carrying out a boycott of iceberg lettuce on the grounds that such boycotts are against the nation's labor laws. This is an unusual move, because the labor laws specifically exclude farm workers. Since they don't benefit from any of the provisions of the labor laws, they have also been excluded from the laws' penalties.

The catch here is that a small handful of the union's members work as "packers" and are technically not farm workers. The NLRB is arguing that because of this the whole union is subject to the penalties of the no-boycott law, even though the overwhelming majority of the union's members are still not covered by the law's protection of collective bargaining.

So the possibility exists that the courts will stop the boycott, the NLRB will hold hearings charging the union with illegal boycott activities, and that the union may eventually be liable for civil damage suits from the non-union growers that could bankrupt it and permanently put it out of business.

It's not too hard to see what is really happening here: the power of the growers and the government is being harnessed in an all-out fight to break the union and deprive black and minority workers of their right to organize and strike. The law is being used to strip the poor of their rights and to protect the rich.

The dangers of such a short-sighted policy are too awesome to contemplate. If the workers' nonviolent tools are brutally taken from them, future farm strikes could well be as bloody as the industrial strikes of the past. And so long as one small, struggling union of the poor is allowed to be crushed, no worker, even one in the big and seemingly powerful trade unions, is safe.

III. Crops and Foreign Labor Importation
IV. Farm Product Prices Drop

I. FARM WORKERS ORGANIZE

Florida

Some 1400 farm workers and crew leaders in Belle Glade, Florida, members of the United Agricultural Workers of America, have voted to accept a charter as a local union of the Laborers International Union, AFL-CIO. In the first successful effort ever made to organize farm workers in Florida, the Industrial Union Department of the AFL-CIO lent its support to the drive undertaken by the United Steelworkers of America among canning processing workers at American Can and Continental Can Companies in Winterhaven. At an Industrial Union Department meeting late in April, thirty international unions decided that the Laborers International Union should assume jurisdiction over agricultural workers on the East Coast.

The Laborers Union, sixth largest in the United States, is expected to pour up to half a million dollars into a massive organization movement aimed at unionizing migrants and other farm workers up and down the Eastern seaboard. It is estimated that by fall the campaign will reach the proportions of the widely publicized West Coast organizing drive centering around the grape strike in Delano, California.

Both the Catholic and Protestant churches are deeply involved in this movement to bring basic union protections to some 106,000 farm workers--primarily Negro, Mexican-American, and Puerto Rican--whose annual earnings average $1,312.

Working and living conditions in the Belle Glade area are among the worst in the nation. Jack Ross, formerly head of the Florida State Citizens Committee on Agricultural Labor, had this to say about Belle Glade migrant housing in July, 1965: "I have had a lot of contact with slums in lots of places, and I am not easily shocked. But I saw conditions in Belle Glade which were worse than almost anything I have seen in Chicago or New York....I can only say that I intended to stay and see all I could, but after about 3 hours and visits to 20 or so places, I was so upset that I had to leave. I drove home earlier than I had planned and stayed awake most of the night trying to absorb it all....Negro families in Belle Glade pay about the same for two miserable rooms in wretched conditions as I pay for my comfortable house in the suburbs."

Arizona

Earlier this year some 175 central Arizona farm workers organized the Arizona Farm Laborers' Association, calling for higher wages, better working conditions, greater job security, and protection from employment abuses. The Association is working closely with community action groups in the agricultural towns of Avondale, Stanfield, Guadalupe, and Cashion, and has the support of the Arizona

Migrant Ministry. There does not seem to be direct labor union involvement as in Florida, although John E. Evans, Secretary-Treasurer of the Arizona AFL-CIO, promised he would fight for the inclusion of migrants under the benefits of all labor regulations in the state. In January, 1966, the workers staged a peaceful protest march at the State Capitol Building as Governor Goddard spoke on their behalf in his message to the State Legialature.

California

The ten-month-old grape workers' strike for recognition of their farm unions by some 34 growers in the Delano area met with partial success in April, when one of the largest ranches, Schenley Industries, finally agreed to negotiate without conditions with one of the unions, the National Farm Workers Association.

The news came to the strikers as they were finishing the last leg of a 25-day, 300-mile protest march from Delano to the state capital in Sacramento. Jack Conway, Executive Director of the seven-million-member AFL-CIO Industrial Union Department, and Paul Schrade, Regional Director of the United Auto Workers, accompanied the farm workers, led by Cesar Chavez, on the first day of the pilgrimage. Two weeks later, other AFL-CIO officials walked part way with the strikers; among them was William Kircher, Director of Organization, to whom Chavez attributes much of the credit for the Schenley offer to negotiate. The march was climaxed by an Easter Sunday rally, largest of its kind since unions began trying to organize farm workers over 30 years ago; 8,000 demonstrators thronged the steps of the Capitol and listened to speakers who had flown in from as far away as New York to be with the strikers.

The strike began in September when members of the Agricultural Workers Organizing Committee, AFL-CIO, walked off grape ranches in the Delano area protesting low wages and poor working conditions. Ten days later the independent National Farm Workers Association joined hands with AWOC, both groups pledging maintenance of the strike effort until the growers agreed to recognize the unions and bargain with them. Money was contributed by local unions and church groups, but it wasn't until Walter Reuther, head of the United Auto Workers and the Industrial Union Department, presented the strikers with a Christmas gift of $5,000 and promised a $5,000 monthly contribution "until this strike is won" that the farm unions were able to expand their strike efforts.

The partial breakthrough (33 other struck growers have yet to follow Schenley's example) was hard won. Nearly 10,000 people across the nation had participated in boycott activities against Schenley products. Boycott offices were set up in 16 of the largest U.S. cities. Over two million pledge and protest cards were distributed across the nation. The strike sympathizer had only to fill in his name and mail the card to Schenley. One hundred seventeen boycott committees, loosely directed from California, picketed supermarkets and liquor stores where Schenley products were sold.

On April 7, the day after the Schenley offer, Robert DiGiorgio, head of the area's largest grape ranch, offered to hold elections among his workers to determine whether or not they wanted to be represented by a union. As conditions to holding these elections, DiGiorgio called for a halt to boycott pressures, compulsory arbitration as part of negotiation procedure, and no-strike clauses in any final contract with the company. Chavez declined the offer, saying that the pickers presently in the field were strikebreakers who therefore had no right to vote, and that the pre-condition of cessation of boycott pressures was unacceptable.

Subsequent events have indicated that even this limited DiGiorgio offer was not made in good faith. Late in April, a near-riot between pickets and DiGiorgio guards broke up a meeting of company and union leaders. Cesar Chavez said: "Talks would be fruitless as long as DiGiorgio continues doing bodily harm to our pickets. We simply cannot sit in the same room in Fresno." (According to union reports, a picket, Michael Rosas, was hit on the head and required ten stitches when he helped a fellow picket who had been held at gunpoint and later dragged away by a guard. DiGiorgio officials have since ordered their guards to disarm.)

In addition, a DiGiorgio letter to its farm worker employees said the company "firmly believes you do not need a union, but we are ready and willing to let you tell us in a secret ballot if you want a union or if you want DiGiorgio Fruit Corporation." Gilbert Padilla, Vice President of NFWA, said the letter "tells workers they can vote for the union or for their job--some 'free' election."

In view of these facts, Chavez has diverted the massive boycott machinery from Schenley to DiGiorgio, and has called for a halt to all purchases of DiGiorgio products, which include S & W Fine Foods, TreeSweet, and White Rose brands.

During the week of May 9, approximately 2,000 people in California alone walked on picket lines. In Los Angeles, NFWA had over 500 pickets including officials from the AFL-CIO, Teamsters (independent), and International Longshoremen's and Warehousemen's Union (independent). One store finally sent its employees home.

Texas

On June 1, 1966, 500 farm workers, members of the Independent Workers Association, went on strike in the field of three of the largest melon growers in the lower Rio Grande Valley. According to a union spokesman, the workers are asking for a contract with the growers and a wage increase to $1.25 an hour.

II. FARM LABOR LEGISLATION

The Delano Hearings

Early this year the Senate Subcommittee on Migratory Labor held public hearings in the Delano area of California. Individuals and organizations concerned with the living and working conditions of farm workers were invited to present testimony.

Some of the statements presented were unexpectedly strong in favor of legislation for farm workers. The Catholic Bishops of California united for the first time in an urgent appeal for collective bargaining rights and a minimum wage for farm laborers. The statement, read by Bishop Donohoe, was applauded by nearly 1,000 people gathered in the Delano High School Auditorium. Senators Murphy (R-Calif.), Kennedy (D-N.Y.), and Williams (D-N.J.) broke their own rules of procedure by leading the applause for the Bishop, who said in part, "It is becoming evident that unless farm workers are given the chance to organize they are going to become wards of the state. This one act [collective bargaining] will not solve the farm labor problem, but it will be a first and giant step toward a solution."

Copies of the hearings may be obtained from Frederick R. Blackwell, General Counsel, Subcommittee on Migratory Labor, New Senate Office Building, Washington, D.C.

Minimum Wage

On May 26, 1966, the House of Representatives passed a minimum wage bill, H.R. 13712, which includes farm workers for the first time. This historic breakthrough extends a $1.00 minimum hourly wage to some 400,000 to 485,000 workers who labor on farms hiring more than 500 man-days of work during a calendar quarter. The hourly minimum goes into effect February 1, 1967, rises to $1.15 one year later, and reaches $1.30 in February, 1969.

When the bill came before the House it stated that farm workers must work more than 13 weeks a year in agriculture for their work days to count toward the 500 man-days which a farm must hire before being required to pay a minimum wage. However, once a farm reached the 500 man-day level, then all workers on that farm would receive the minimum regardless of whether or not they had been included in the original man-day count.

Unfortunately, an amendment offered by Congresswoman Green of Oregon was adopted to exclude from coverage those who work less than 13 weeks a year, even if they work on farms which are required to pay the minimum. This would give rise to basic inequities: two workers picking side by side, accomplishing the same tasks, would be receiving different wages.

Senate action on the bill, which is now before the Senate Subcommittee on Migratory Labor, will probably come in late June. We strongly urge you to write your Senators stating that you are in favor of the minimum wage, but with a 300-man-day test rather than the 500 (thus including more workers on large farms); that you believe wages for farm workers should begin at $1.15 instead of $1.00; and finally, that you are opposed to the Green amendment or any similar one.

Collective Bargaining

A Senate bill, S.1866, now in the Senate Committee on Labor and Public Welfare, would amend the National Labor Relations Act to include farm workers, who have heretofore been specifically excluded from the effective right to bargain collectively. We hope you will write your Senators that you support this bill, due to be voted on in late June. Remind them of the critical situation in Delano, and of the fact that if NLRA coverage had been extended to farm workers, the ten-month struggle there for union recognition would not have been necessary.

Unemployment Compensation

A House bill, H.R. 8282, was reported out of the Ways and Means Committee with the farm labor clause struck out. It is now before the House Rules Committee, and when it reaches the floor for a vote, it is expected that some efforts will be made to restore farm worker coverage. Again, letters to your Representative supporting the extension of coverage to farm labor are essential.

III. CROPS AND FOREIGN LABOR IMPORTATION

Following the expiration of Public Law 78 (the Mexican Labor Importation Program) at the end of 1964, growers were forced to turn again to use of domestic farm workers, who had been neglected by most large growers for many years in favor of the almost limitless supply of low-paid braceros available under P.L. 78. Since higher wages and improved conditions would have to be offered in order to attract American workers, some growers still hoped to obtain Mexican and other foreign

workers under Public Law 414 (the Immigration and Nationality Act). However, the Secretary of Labor used his authority to protect jobs and opportunities for American workers, and set minimum wages and conditions that growers would first have to offer domestic workers before he would approve importation of foreign workers under P.L. 414.

Most growers found an adequate supply of domestics available when they offered improved wages and conditions. In some cases imported workers were authorized in certain crops and for specific periods of time. Some growers who failed to show that they had made genuine efforts to recruit domestic workers had their requests for foreign workers denied. By late fall it was clear that the ban on unlimited importation of foreign labor was a resounding success: 100,000 more domestic workers picked the nation's crops at slightly higher wages than the year before.

Again in 1966, the replacement of imported with domestic labor has increased, and according to the U.S. Department of Labor, the number of foreign workers in the United States as of April 30 totaled 1,205, in contrast with 6,248 a year ago. Here is a brief summary of current problem areas, and recent decisions by the Labor Department on the authorization of temporary foreign labor importation.

California--Asparagus. Early in May the U.S. Department of Labor refused the request by asparagus growers for 2,500 foreign workers. The Labor Department's California regional director of the Bureau of Employment Security, Glenn Brockway, stated that the asparagus growers "declined to undertake an effective recruitment program to obtain American workers." Until very recently the growers have consistently refused to use state Department of Employment services to get domestic workers. According to Brockway, the government has repeatedly urged the asparagus growers to provide improved family housing, and offer higher wages and better working conditions in order to attract American workers. "These efforts were not made," he added.

California--Strawberries. On May 16, 1966, the Department of Labor authorized the importation of 1,000 Mexican workers to harvest the strawberry crop in Monterey County. After consulting with members of the California Farm Labor Panel, and with the California Department of Employment, it was decided that "Salinas Strawberries, Inc. has made a wide range of genuine and often costly efforts to attract workers... /including:/ acquisition of two trailer courts with the total of 254 modern and fully equipped trailers representing an investment approaching 2½ million dollars; acquisition through lease of 34 family housing units...."

Oscar Gonzalez, President of the United Farm Workers in San Jose, strongly opposes this authorization of imported workers. Gonzalez claims that the above-mentioned family housing offered to workers is rented at exorbitant rates which "could in no way be construed as encouraging families to come to Salinas," and that sufficient efforts were not made to attract domestic workers this year. Whereas last year hundreds of San Jose workers were bused daily 60 miles to and from Salinas, no similar attempts were made this year.

IV. FARM PRODUCT PRICES DROP

Early in April, Secretary of Agriculture Orville L. Freeman reported that farm prices have fallen since February 15. He predicted that the average prices of all farm products will be 6 to 10 per cent lower in the fourth quarter of the year than they are now; more specifically, vegetables are expected to drop 20 to 25 per cent by the end of the year. He listed these vegetable price decreases since February 15: fresh lettuce down 35 per cent; cabbage, celery, and onions down more than 20 per cent; fresh oranges and grapefruit down 7 per cent.

MIGRANT Lab

MERGER AGREEMENT between the AFL-CIO Agricultural Workers Organizing Committee and the National Farm Workers' Association gets favorable comment from, left to right, AWOC Rep. Larry Itliong, Executive Sec.-Treas. Thomas L. Pitts of California AFL-CIO, NFWA head Cesar Chavez and AFL-CIO Dir. of Organization William L. Kircher. The merger pact, which will unify striking grape workers for the Aug. 30 representation election at two DiGiorgio Corp. locations, will go to the next meeting of the AFL-CIO Executive Council for ratification.

Migrant Labor Council

WASHINGTON REPORT

printed every Friday in Washington, D. C. by UAW Citizenship-Legislative Department

Vol. VI, No. 19 — May 16, 1966

United Automobile, Aerospace, and Agricultural Implement Workers of America, UAW, AFL-CIO

"I suggest, Sheriff, that you read the U. S. Constitution before you arrest any more strikers." *Sen. Robert Kennedy*

Sen. Robert Kennedy made a dramatic appeal for justice among farm workers during recent hearing in California. Quotation above aimed at law officers who side with growers did much to calm an explosive economic situation.

The annual—virtually invisible—battle over California water monopoly is now under way on Capitol Hill. There are no headlines. No TV cameras. No exposés by the columnists. But at stake are huge supplies of federally-subsidized irrigation water, vast tracts of the country's most fertile soil and control of our most populous state.

The budget item is a mere $12 million to continue construction of a $157 million underground pipeline on the San Luis project (San Joaquin Valley of central California). This system will deliver subsidized irrigation water to a modern feudal barony—the most tightly held block of rich farmland in America.

(Continued on page 2)

Should taxpayers subsidize rich anti-labor growers?

By George Ballis

American taxpayers are paying through the nose for cheap water supplied by the federal government. While many family farmers are helped by this, today huge rich land barons in California not only pocket big profits, they also keep farm workers on strike, refusing to bargain the American way for wages, hours, and working conditions.

Farm Labor

NATIONAL ADVISORY COMMITTEE ON FARM LABOR

Activities Report
May, 1966

During the past year the National Advisory Committee on Farm Labor has concentrated on three major issues affecting American farm workers: the Delano (California) grape workers' strike, proposed minimum wage and unemployment compensation legislation, and the transition from reliance on imported labor to reliance on domestic workers following the end of Public Law 78 (the Mexican Importation Program). NACFL emphasized its "multiplier effect" by sparking efforts of groups all over the country, and continued its informational and educational work on an ever-increasing scale in response to growing demands.

The Grape Strike

The California grape strike of the Agricultural Workers Organizing Committee, AFL-CIO, and the independent National Farm Workers Association, was a continuing concern of the National Advisory Committee on Farm Labor. NACFL took the lead in bringing together widely representative church, labor, and civil rights groups in New York City that were concerned with backing the strike effort, and set up a meeting with Schenley lawyers to ask the company to sit down with the strikers. This meeting brought an important element to the strike movement: the powerful involvement of national organizations that voiced their support by putting the issues in the perspective of simple justice and morality.

To mobilize support for the grape strike, NACFL acted in the following ways:

1. Sent out thousands of fact sheets on strike developments to concerned organizations and individuals and to news media.*

2. Wrote to key people in church, labor, and civil rights organizations whose moral and financial support was essential in making the strike an issue of national concern.

---

*NACFL's mailing list includes the following:	Approx. Number
1. Organizational leaders of: all major faiths and church denominations, plus many local church groups; civil rights groups; farm worker organizations; state citizens' committees on farm labor; national, state, and local anti-poverty, political, and voluntary and fraternal groups Individuals: students, teachers at all levels; community leaders; state and local government officials; and hundreds of interested persons who have asked to receive NACFL's mailings regularly	2,750
2. Labor: Presidents, Secretary-Treasurers, and Education Directors of all National and International Unions and state bodies	450
3. Press: All major U.S. dailies and weeklies, news services, and magazines; columnists, radio and TV commentators, and writers	375

5. Congress: All U.S. Senators and Representatives	535
6. U.S. Government Officials (in Washington, D.C., and regional offices)	300
7. Libraries	150
Total	4,835

3. Published a 36-page pictorial report, The Grape Strike, which was distributed to the entire mailing list; requests for additional copies continue to pour into the office and total close to 15,000 pamphlets since the March printing.

4. Placed an article on the strike in The United Teacher.

5. Had its Program Secretary appear on a radio program which dealt with the issues involved in the strike.

On April 6, 1966, Schenley Industries announced they would recognize and bargain with the National Farm Workers Association, and a day later the Di Giorgio Corporation agreed to hold an election. NACFL will continue to back the strike effort by pressing for swift action on the promised negotiations, and will encourage further organizing efforts--in California and elsewhere--which hopefully will follow this historic breakthrough of the farm workers' unions in achieving recognition.

Legislation

As the minimum wage bill including farm workers went through several stages, NACFL presented testimony at the Congressional hearing and sent successive action memos and fact sheets to its mailing list asking for letters of support to be sent to Congressmen. NACFL has sent several letters to every Congressman urging support for the bill.

When a bill providing unemployment compensation for farm workers was being considered by the House Ways and Means Committee, NACFL again presented testimony and also sent action memos to organizations and individuals whose Representatives were on this Committee, calling for wires and letters at this crucial point, to ensure that the bill would be reported out with the farm worker provision intact.

All of these mailings have the "multiplier effect"--a number of organizations quote directly from our materials in their own publications, often sending out special mailings as a result of NACFL's alerting them to the issues, and other organizations request quantities of our memos and fact sheets to send directly to their mailing lists.

The End of Public Law 78

The end of Public Law 78 meant the end of an unlimited supply of imported Mexican workers, and victory in a struggle which NACFL had fought since its inception in 1958. NACFL had sought repeal of the importation program in the belief that domestic workers--given the opportunity to demand higher wages and better working conditions without fear of losing their jobs to low-paid foreign workers--could form a skilled and stable work force. NACFL predicted that many thousands of unemployed and part-time farm workers would, under improved conditions, seek work in the fields where they had largely been displaced by imported workers for so many years.

NACFL cooperated with the Department of Labor in tapping the domestic labor supply, and asked for assistance from voluntary groups in recruiting workers in areas where a shortage was expected. Growers who requested foreign workers under Public Law 414 (the Immigration and Nationality Act) were required first

to offer domestic workers wages and conditions set by the Labor Department; NACFL circularized these regulations to local groups urging them to check on compliance with the regulations in their areas, and also urging them to press for use of these minimum standards in all farm recruitment.

Efforts by growers to use P.L. 414 in place of P.L. 78 brought quick response from NACFL, acting as a "watchdog" in this transition period, investigating and publicizing the facts in each situation and countering the propaganda barrage from growers who claimed that crops were rotting in the fields because of a labor shortage. NACFL gave strong support to the Secretary of Labor in his basic stand against renewed importation, for which he was subject to much abuse from grower organizations and some legislators representing their views. NACFL also criticized the Secretary in several cases where imported workers were authorized. In April, 1965, NACFL sent a memo, "The Current Farm Labor Situation," to its mailing list, with special letters enclosing the memo to all Senators and Representatives.

NACFL published a 16-page pamphlet, The Case for the Domestic Farm Worker, dealing with the Florida situation and written in answer to a grower publication which distorted the facts. The pamphlet was distributed to thousands, including government officials and members of Congress.

In September a proposed Senate amendment to the Farm Bill would have transferred authority over importation of foreign labor from the Secretary of Labor to the Secretary of Agriculture. NACFL fought, along with other concerned organizations, to defeat this move, and contacted many Senators personally. The amendment, backed by powerful grower interests, would have been a blow to domestic workers since the Agriculture Department is ill-equipped to administer the program. The vote was 45-45, with Vice President Humphrey casting the deciding vote to defeat the amendment and retain the Labor Secretary's authority on this issue.

By late fall it was clear that the ban on unlimited importation of foreign labor was a resounding success: 100,000 more domestic workers picked the nation's crops at slightly higher wages than the year before; the over-all price of fresh fruits and vegetables dropped even though the Consumer Price Index rose; farm income soared to a record high.

Sugar Beet Wage Hearings

In November, 1965, NACFL notified key individuals and organizations in six states where hearings on 1966 sugar beet wages were scheduled for December and January, and succeeded in having testimony presented on behalf of the workers. In more than one area, no such testimony backing increased wages had been given in previous years to counter the well-organized presentation of the growers.

Education

The National Advisory Committee on Farm Labor continued its periodical Information Letter, sent to the entire mailing list and distributed even more widely through other organizations that requested quantity lots. Many new persons became concerned with the plight of farm workers as a result of mention of NACFL and its work in a number of newspaper and magazine articles, including several articles in labor publications for which NACFL provided photographs. Ralph McGill's widely syndicated column quoted from NACFL's pamphlet, Poverty on the Land (a report on its Public Hearings), on October 9, 1965.

NACFL's Executive Secretary appeared on a television panel discussion on farm labor issues. Her report on an extensive California field trip was circulated to the entire mailing list (including Labor Department and other government officials), along with a letter urging support of farm labor legislation.

One example of NACFL's "multiplier effect" is given in the following quote from a letter from the Unitarian Society minister in Madison, Wisconsin:

> "While I am sure you receive many such communications, it occurred to me that you might be interested to know the practical usefulness of the bulletins and background material which we receive from time to time from your office. The Social Action Committee here in our church has for some years been very much concerned with the problems of migrant workers....Most recently, we responded to your memorandum of March 1st by including with the order of service on a Sunday morning recently the enclosed memorandum from our committee. I am sure that many people have responded in useful ways...."

This minister also enclosed a radio talk he had given which cogently presented the basic relationship of rural and urban poverty.

An ever-increasing number of requests for information from students, teachers, writers, unions, and others have been answered. Many federal and state officials also rely on NACFL publications and request copies for distribution to their staff members.

Field Work and State Citizens' Committees

The Florida Citizens' Committee on Agricultural Labor, organized in 1964 by NACFL's Field Representative, Stanley Hamilton, continued its effective work by helping to achieve passage of a transportation safety bill in Florida, and it will be ready to give support to the organizing efforts among farm workers begun recently by the Steelworkers Union. Members of the Michigan Council on Agricultural Labor also worked on a state transportation safety bill, and the Indiana Citizens' Committee has backed a bill setting health standards for migrant camps. The two California groups, the Emergency Committee to Aid Farm Workers (in Los Angeles) and Citizens for Farm Labor (based in Berkeley), were most active recently in mobilizing support for the grape strike. Other state citizen committees are functioning in Oregon, Pennsylvania, Texas, and Washington. NACFL hopes to reactivate the New York and Wisconsin committees as well as organize committees in other states.

Other Activities

NACFL continued its close cooperation with the National Council on Agricultural Life and Labor, of which it is a member. Early in 1965 NACFL's Executive Secretary participated in a Consultation on Services to Children in the East Coast Stream. NACFL staff are in constant communication with Washington, the farm labor organizing fronts, and concerned groups.

- - - - - - - - - -

The minimum wage bill covering farm workers is close to a vote, and if strong support can be mobilized, it will be passed. House committees are examining bills which would include farm workers under unemployment insurance and collective bargaining provisions. Never before have so many aspects of the farm labor problem been so close to solution--and never before have the need and opportunity for NACFL's effective work been so great.

$1.75 Wage, Union Shop Gained in Grape Contract

HISTORIC FIRST CONTRACT is signed providing 35-cents-an-hour pay raise and full union shop for grape workers employed by Schenley Industries in California. From left, AFL-CIO Organizing Dir. William L. Kircher, Schenley Attorney Sidney Korshak and Dir. Cesar Chavez of the National Farm Workers Association, which represents the Schenley workers.

'Milestone' Pact Signed By Schenley

Los Angeles—A milestone labor agreement providing a minimum pay scale of $1.75 hourly for farm workers, a union hiring hall, dues checkoff and a union shop was signed here June 21.

The one-year pact, between Schenley Industries, Inc., and the independent National Farm Workers Association, covers some 500 Schenley employes at their vineyards in the Delano area.

It is expected to pave the way for a sweeping revolution on the farm labor front in California and elsewhere in farming centers across the nation.

Grape Strike Impact

Its immediate impact will hit hardest in the Delano area where several hundred grape workers have touched the conscience of the nation in a nine-month strike against deplorable wages and working conditions.

William L. Kircher, national organizing director of the AFL-CIO, who played a key role in negotiating the pact, hailed the agreement as a "significant breakthrough and the first contract of its kind anywhere in the farm industry."

"The Schenley-NFWA contract does many things," Kircher said. "It gives farm workers a firm collective bargaining base and it dramatically demonstrates real union accomplishment.

"It sets a model upon which other farm workers can look with understanding that 'it can be done.'

"And it provides the opportunity for the structure of an actual ongoing union operation within the agricultural industry.

(Continued on Page 8)

Better Jobless Aid Bill To Be Sought in Senate

(Continued from Page 1)

fits with tougher qualifications which keep many jobless workers from receiving them.

The AFL-CIO convention last December had termed the Administration bill "imperative" in view of the "crazy quilt variations" in the 50 state laws.

The real House battle was in the Ways & Means Committee, where a conservative coalition dumped the Administration bill and even voted down the attempt of Committee Chairman Wilbur D. Mills (D-Ark.) to preserve some meaningful federal standards.

AFL-CIO Pres. George Meany's comment at the time was that the committee has passed up "an opportunity to provide realistic legislative safeguards against future recessions," and "instead provided only minimal improvements and no federal benefit standard whatsoever."

Meany urged that the bill be used by the Senate as "a vehicle . . . to improve unemployment insurance" through "realistic, meaningful federal standards." He added:

"Certainly those persons unemployed through no fault of their own should not be used as pawns by the several states in their campaign to pirate industry from socially enlightened to socially backward areas."

Seven Republican members of the Ways & Means Committee, in a report accompanying the bill to the House, gloated over the measure as "a great victory."

They said the Administration bill "was designed to federalize and straitjacket state unemployment insurance programs. It would have established federal benefit standards, both with respect to amount and duration."

Not only did the committee reject all these, the GOP members said, but it also added a provision for court review if the Secretary of Labor should rule that a state's program does not meet even the mild federal standards now in effect.

Labor

Newcomer wins on the farm

Recently chartered AFL-CIO affiliate defeats Teamsters as bargaining agent for workers at two California farms

The AFL-CIO celebrated Labor Day this week in a manner to which it has become unaccustomed. A newly chartered affiliate won a surprise victory in an area of enormous future importance to organized labor.

The winner was the United Farm Workers Organizing Committee, chosen bargaining agent by workers at two California farms of the giant Di Giorgio Corp. The vote was 530 for the UFWOC to 331 for the International Brotherhood of Teamsters in an election conducted by the American Arbitration Assn.

Neither state nor federal law requires an employer to bargain with a union that represents his agricultural workers, and no government mechanism exists to determine such a union's majority status. The Di Giorgio management agreed voluntarily to the AAA election, presumably to end 11 months of strike, and apparently under the impression that the Teamsters would win.

Reversal. In an earlier election—run unilaterally by Di Giorgio and boycotted by the AFL-CIO predecessor to UFWOC—management representatives advised workers in writing that the Teamsters would give them better representation. The Teamsters, unopposed, won.

When demonstrations continued, Di Giorgio agreed to two AAA elections: one among farm workers and the other among 140 packinghouse workers, truck drivers, and warehousemen on the two farms. The Teamsters won the packinghouse and drivers' vote, 94 to 43.

Breakthrough. Last week's AFL-CIO victory among the farm workers follows recognition by Schenley Industries, Inc., of the National Farm Workers Assn. as bargaining agent for 450 vineyard workers—the first such union achievement after years of unsuccessful attempts to organize California farm workers.

NFWA, a community-based organization backed by many religious groups, had a mainly Mexican-American membership. The AFL-CIO Agricultural Workers Organizing Committee had a mainly Filipino-American membership. Last month they merged and received an AFL-CIO charter as UFWOC in time for the Di Giorgio election.

The merger and victory—and a Di Giorgio announcement that negotiations would begin immediately—spread concern among employers in California's multibillion-dollar agricultural industry. Not the least of their worries was that California's state legislature—no longer heavily rural as a result of reapportionment—might legislate collective bargaining machinery for farm workers. **End**

Migrant Labor

To State Capitol:

20,000 Texans Join Farm Worker March

Austin, Tex.—Twenty thousand Texans marched to the Sta Capitol here Labor Day to demand a $1.25 state minimum wa law and to show their sympathy for a band of farm workers w had walked 400 miles from the Rio Grande Valley to dramati their low wages and their strike against two corporation farms.

They also wanted to show the state's conservative Democratic organization that many Texans were ready for massive socio-economic changes.

At a barbecue that followed Pres. H. S. Hank Brown of the Texas AFL-CIO, which collected more than $16,000 from unions to sustain the marchers and the farm strike and which arranged the Labor Day march and rally, said, "This is Texas labor's greatest day."

Only five days before, Gov. John Connally, accompanied by State Atty. Gen. Waggoner Carr, who is a candidate for U.S. Senate, and state Speaker of the House Ben Barnes, had met the farm workers' march 50 miles from their destination urging them not to go on.

"There might be trouble," Connally warned.

There was none, as the biggest protest march in modern Texas history moved the last three miles to the State Capitol. Six blocks from the Capitol grounds, Texas Democratic Sen. Ralph W. Yarborough, a member of the Senate Labor Committee, joined the march.

From the steps of the Capitol, Yarborough told the workers, who had come from all over Texas, "a hundred years ago we ended physical slavery. We are here today to end . . . economic slavery.

"Texas has more people living the poverty level than any oth state.

"We are here today to lift Texa out of poverty."

Speaker after speaker said th the rally was just the start of movement to change things.

William L. Kircher, directo of organization of the nation

(Continued on Page 6)

20,000 Texans Join Farm Worker March

(Continued from Page 1)

AFL-CIO, who walked the last two days of the march, said:

"These campesinos (farm hands) are setting a good example for all working Texans who do not belong to a union—and only 10 percent of the work force does."

He added that "This new union of farm workers is going to be built by farm workers and for farm workers."

The United Farm Workers Organizing Committee, recently chartered by the AFL-CIO, is "the most significant event for organized labor in recent years," Eugene Nelson said.

Nelson, who served as a picket captain in the Delano, Calif., grape pickers strike, brought what he learned there to South Texas, where he organized the second UFWOC group in the country and then led 40 marchers for 56 days half way across Texas. He said:

"It's a cold and grotesque paradox that the people who produce the food—the vital substance—live under the worst conditions of any employe group in the country."

In the march of the farm workers toward Austin were two clergymen, the Rev. Antonio Gonzalez and the Rev. James Novarro.

From the podium the Rev. Novarro said "We were brought together by Divine Providence—how else could a Roman Catholic priest and a Baptist preacher have gotten together."

Father Gonzalez spoke with his mother and father, both migrant farm workers just returned from Michigan, on either side of him.

Cesar Chavez, a leader of the newly-chartered UFWOC, who helped direct the Delano grape strike, told the union members that the union had "taught the growers of California a few lessons in collective bargaining."

Most of the marchers returned to the Rio Grande Valley next day to continue their strike, leaving behind two men on the Capitol steps, one holding a metal religious cross and the other holding flags of America and Texas.

They, and alternates, were to remain there, silent each day, until the legislature passes a law setting a wage floor of $1.25 an hour for all the workers of Texas, including farm hands.

INFORMATION LETTER

Number 31 September, 1966

I. Organizing Farm Workers in Wisconsin
II. Farm Worker Organizing in Texas
III. News Bulletins

I. ORGANIZING FARM WORKERS IN WISCONSIN

"Those people are the most neglected in the state. A friend of mine does volunteer work for them; he says that they've never seen a dentist; that when they break a bone it heals any old way, just so they can go back to picking in the fields."
--An unidentified man, attending a rally of migrant farm workers in Wisconsin.

On August 14, 1966 about twenty-five cucumber pickers set off across the plains of central Wisconsin from Wautoma to Madison to protest their living and working conditions to officials at the state capital eighty miles and four walking days away.

The group, called Obreros Unidos (United Workers) is affiliated with the National Farm Workers Association in California, and headed by Jesus (who pronounces his name Jesse) Salas. A Stevens Point State University student, Salas comes from a migrant family who settled in Wautoma seven years ago and opened a small cafe. He was graduated from high school in 1961 and worked summers in state-sponsored education and social programs for the migrants.

The Obreros Unidos are making simple demands: a $1.25 hourly state minimum wage (at present the state law does not cover farm workers); representation on the 28-member Governor's Commission on Migratory Labor; accident insurance; sanitary facilities; better housing.

Participants in the march (who represent the 4,000 migrants who come to Waushara County during the summer months) encountered no real hostility during their journey to Madison. "One man even stopped his car, said 'good luck' and handed us a ten dollar bill," said the Reverend Anthony Dolski of the Green Bay Catholic Diocese.

Ranks of the marchers swelled to about 150 on the final day, as sympathizers including clergy and nuns fell into line. They were greeted at the steps of the state capitol by government officials, among them Joseph C. Fagan, chairman of the Wisconsin State Industrial Commission, which reports on wage conditions and adjusts wage scales for women and minors. Fagan spoké warmly of the marchers, and attached considerable significance to their dignified protest: "The biggest challenge you gave us, Jesus Salas and your brave band, is to have a human concern. Apathy in moral standards, due to preoccupations in living, in making a dollar, is a growing problem. You gave us for only a brief week the chance to look at something much better than what we have had for some while. And that is the chance to care about someone who is trying very hard to care about his own people."

An editorial in the Capital Times dated August 20, 1966 gives an excellent appraisal of the import of the march: "The migrants ask for a wage [$1.25] that barely breaks through the poverty line. Since Wisconsin prides itself on its social conscience and since exploitation of migrant labor is not a recent development, it seems reasonable to expect the state to pay its due bill with alacrity. The state, which accorded the march a proper dignity, will make a farce of that march if the migrants' petition is shunted, shuffled and referred. There should be no necessity for even the hint of the need for another march."

Wisconsin state law does not provide a minimum wage for farm workers at the present time. It is even doubtful whether the substandard wages set for women and minors by the State Industrial Commission (for women over 16, $1.10 an hour in areas with populations over 1,000; $1.00 in towns under 1,000; for minors 95 cents and 85 cents respectively) apply to migrant women and children.

Joseph Fagan said that if a case were found where men made less money than women working in the fields, his Commission could test the non-discriminatory clause of Wisconsin's fair employment practices law by questioning whether women could receive the minimum and not men. A series of hearings will be held this fall to determine public sentiment concerning a $1.25 hourly wage for migrant workers.

At least one large canning and processing company, Libby, McNeil and Libby, already guarantees its 400 field workers $1.25 an hour. Often Libby pays as much as half of this in deficiency wages to workers unable to pick $1.25 worth on the piecework basis used by other companies.

In answer to the inevitable grower charges that they are presently paying the desired wage, a University of Wisconsin graduate student, Mark Erenburg, who has been working on a wage study with migrants for three years, said that if the workers were making more than $1.25, the processors should not be opposed to paying them the minimum wage.

One of the demands has already been met: the migrants were enjoined to elect their own leaders to represent them on the Governor's Commission on Migratory Labor.

Increased interest has also been shown in improving housing conditions: Mr. Carl Kwasigroch of Middleton, Wisconsin, inspector for farm camps in four counties, said the housing code itself was deficient; it describes such details as screening and ventilation, but says nothing about walls and floors. "How can you possibly judge a dwelling unit?" he asked.

The march has ended, and no economic pressure or walkout is planned, but it took an 80 mile march on blistered feet to gain the state's ear.

II. FARM WORKER ORGANIZING IN TEXAS

> "I am doing it [marching] with my own heart, I have already wasted all my life in the fields. I don't want the new generation to struggle like I did...."
>
> --Reyes Alaniz (quoted from the Texas AFL-CIO News, August 20, 1966)

Starr County, Texas, scene of the most recent farm labor strike, is among the poorest in the nation: the average family income is $1,568, less than one third the

national average. The migrant worker is the worst paid, worst housed and most backward in the four-county Rio Grande Valley. The only person lower on the economic scale is the Mexican worker from across the border.

The strike began on June 1, when 300 workers, with no support, picketed at the gates of La Casita Farms. The strikers, who numbered over 1,000 in late June, voted to affiliate with the California-born National Farm Workers Association, which recently received an organizing charter from the AFL-CIO, a preliminary step toward full membership in the labor federation. (Its new name is the United Farm Workers Organizing Committee.)

The farm workers in Texas have never organized before. They are asking only "a decent wage for a decent day's work." The workers are demanding $1.25 an hour; at present the wage rates range from 40 cents an hour to a top of 85 cents.

Unlike the year-long California grape strike (one of whose leaders, Eugene Nelson, is in great part responsible for the Texas movement), the Starr County strike has received the staunch support of local priests who have spoken out time and time again on behalf of their impoverished parishes.

Father Henry J. Casso, executive director of the Bishop's Committee for the Spanish Speaking in San Antonio, had this to say: "The scope of the strike is illustrated by the fact that some of the poorest people in San Antonio, those migrant farm workers who live around Mission Espada, have contributed food and clothing to the strikers." (More than 10,000 pounds of food was shipped to the strikers by the Bishop's Committee during the first three weeks of the strike.)

Bishop Medeiros of the Brownsville diocese commented upon the significance of the strike in terms of human dignity: "Human labor is not just another commodity on the market; it is something which comes from the human person and confers dignity upon the product of his work. It cannot be bought or sold like groceries or farming tools, because something of the human person is stamped on his work, and we cannot buy or sell human beings."

According to Newsweek Magazine (September 12, 1966), "Neither the march nor its clerical support would be possible without the hard-headed leadership of San Antonio's Catholic Archbishop Robert Emmet Lucey, 75, who likes to recall that his father was a union man. When the strikers recently marched into Lucey's cathedral to offer a basket of melons and a bushel of cotton to God, he told the crowded church: 'We endorse and approve your demand for an hourly wage of $1.25....This objective of yours is a step in the right direction.'"

On July 4, a small group of the strikers began the 387 mile trek to Austin, Texas, to present their grievances to the Governor, and to ask him to call a special session of the state legislature to enact a $1.25 minimum wage law. Among the leaders of the march were Eugene Nelson, former picket captain of the Delano grape strike; Houston Baptist minister James L. Navarro; Houston priest,Rev. Antonio Gonzales; and San Antonio priest,Rev. Sherrill Smith. According to a report in the New York Times only about twenty-five marchers made the entire trip. Three of these were more than seventy years old, and one was eighty-three. Cesar Chavez, head of the United Farm Workers Organizing Committee, AFL-CIO, joined the marchers for an afternoon. The trip was made without incident; in several cities the mayors and city officials turned out to greet the marchers and in some cases offered their political support.

During most of their two months on the road the marchers were accompanied by a small grey burro with $1.25 painted in pink on his side.

Governor Connally paid a surprise visit to the demonstrators en route, and told them he would neither call a special legislative session nor be on hand to meet with them in Austin. Further, he urged that the rally planned in Austin be cancelled because marchers in other parts of the nation had caused "riots, bloodshed, loss of life and property." Father Sherrill Smith called the Governor's token visit "a slap in the face, a pat on the head, the great white father type of thing."

As the small troop marched through downtown Austin, Protestant and Catholic clergy, labor union officials, Negroes representing Martin Luther King's Southern Christian Leadership Conference, and local citizenry swelled the ranks to some 4,000 strong.

Hero of the two and a half hour rally on the Texas State Capitol steps, though not present, was New York Senator Robert F. Kennedy. Over 8,000 people shouted "Viva Kennedy" when a telegram from him was read to the crowd. At one point the participants chanted "We want Kennedy." The liberal Senator has increasingly articulated the cause of the farm worker in Congress and to the nation. He was present at Senate hearings held in Delano, California, and his reply to a charge that it would be impossible to devise a system of collective bargaining for farm workers has often been quoted: "If we can put a man on the moon by the end of the 1960's, it seems we should be able to work out such a simple problem for farm workers after thirty years of talking about it."

Thirty labor union leaders were present, and pledged continued support for efforts to organize the two million farm laborers in Texas. Nicholas Zonarich, head of organizing for the Industrial Union Department, AFL-CIO, said: "For the first time the farm workers have been united into the house of labor. We shall support you."

III. NEWS BULLETINS

1. The Congress finally approved amendments to the Fair Labor Standards Act assuring for the first time some 400,000 farm workers (those who labor on farms hiring at least 500 man days of work during a calendar quarter) a $1.00 hourly minimum wage beginning February 1, 1967. The minimum rises to $1.15 in 1968 and stops at $1.30 in 1969. Sugar cane workers are included in the coverage, but local, temporary workers are not.

Senator Jacob K. Javits (R-N.Y.) led a floor fight to include a provision regulating child labor in agriculture; although it was defeated, the final bill does contain a provision prohibiting the employment of children under 16 in "particularly hazardous" agricultural occupations.

While the bill is certainly an encouraging beginning in the efforts to bring farm workers into the mainstream of American life, it is important to realize the narrow scope of coverage: in the Rio Grande Valley of Texas, for example, where extreme poverty is the lot of nearly every worker, the federal minimum will not have any effect, for there are very few farms large enough to come within the provisions of the law.

****

2. The year-long strike of some 2,000 grape pickers in Delano, California, directed first at Schenley Industries and more recently at the DiGiorgio Corporation, has been a struggle for employer recognition of two farm unions. In April, Schenley Industries agreed to recognize and bargain with one of the unions, the former National Farm Workers Association, an independent grass-roots organization headed by Cesar Chavez. A satisfactory contract was signed several weeks later.

By mid-summer the DiGiorgio Corporation, largest grape ranch in the area, had agreed to hold an election to determine which union, if any, the pickers preferred. The issue was further complicated when the Teamsters Union saw a chance to take advantage of the unionizing efforts, and began signing up workers in the DiGiorgio fields. The election was planned for August 30, to be run by the American Arbitration Association.

It was feared that since the Agricultural Workers Organizing Committee, AFL-CIO, and the National Farm Workers Association would be listed separately on the ballot along with the Teamsters, the three-way ballot might lead to a Teamster victory. On August 22, the two farm unions merged into the United Farm Workers Organizing Committee, AFL-CIO; the new union has received its organizing charter, a preliminary step toward full membership in the labor federation.

1,343 farm workers cast their ballots a week later at the DiGiorgio ranches, and only 19 rejected union representation. The vote was overwhelmingly in favor of the merged union, as opposed to the Teamsters.

****

3. Oscar Gonzalez, head of an independent farm union in California, called a strike in the tomato fields of Albert Aguilar in the Santa Clara Valley on August 26. It is the first farm worker strike in the history of the valley.

According to the United Farm Workers Union, Aguilar laid off 200 domestic pickers in anticipation of the arrival of Mexican braceros later that week. Said Gonzalez: "We're going to make them obey the criteria for braceros." (In order to bring in Mexicans, a grower must first pay at least $1.40 an hour to domestics; if there is a labor shortage even at this wage rate, the grower can apply for foreign workers.) Gonzalez charged that Aguilar is paying only $2.50 a day to pickers.

One effect of the strike is that braceros may not be allowed in the fields if investigators from the state determine that the strike is valid.

****

4. According to the Los Angeles Times "California's gross farm income will soar to an all time high of more than $3.8 billion this year despite the dramatic and far-reaching changes made in the farm labor work force."

Farm Labor Group Given New Charter

CHICAGO — The AFL-CIO gave new momentum and drive to the farm workers campaign in California by chartering a new organizing committee made up of the groups that have merged their efforts in the Delano grape strike.

The Executive Council voted a charter for the United Farm Workers Organizing Committee and called the action "an essential step toward winning a measure of economic justice for farm workers."

The charter was presented by AFL-CIO Pres. George Meany to Cesar Chavez, director of the National Farm Workers Association, and Larry Itliong, the Delano director for the Agricultural Workers Organizing Committee.

The two groups have merged in their efforts to win union recognition in the grape fields and are currently appearing as a single unit in a representation election scheduled for Aug. 30 at the giant DiGiorgio Corp.

Meany termed the granting of the charter an event of "great importance." Chavez said it was a "historic moment" and the beginning of "real unity" and a major effort to organize exploited farm workers.

Chavez said he looked forward to the time when the organizing committee would turn in its charter for one as a national union, emphasizing that the farm workers would be best off in their own union.

Meany pointed out that the AFL-CIO has been actively supporting the grape strikers and will continue its help. AFL-CIO Dir. of Organization William L. Kircher, who has been active in the strike and assigned AFL-CIO organizers to the current DiGiorgio campaign, participated in the charter ceremony.

Farm Labor

Huelgistas March

By JOHN McKEON

The march of the **huelgistas** from Rio Grande City to the state Capitol of Austin, Texas came to a dramatic close Labor Day on the capitol steps. A crowd of sympathizers, conservatively numbered at "somewhere around ten thousand" by capitol police, joined the original thirty marchers for the last four miles of the 480-mile trek.

The march, organized by Father Antonio Gonzalez, a Houston priest, was to dramatize the need of Texas migrant workers for a living wage. More than two million Texas farm workers, the overwhelming majority of them Mexican-American or Negro, average 50 cents an hour for their labor when they work at their most highly seasonal of all trades.

The signs carried by the marchers spelt out their needs in simple terms: $1.25 an hour **por la Justicia y la Dignidad** (for Justice and Dignity).

In the Texas-invented ploy known as "Heading Them Off At The Pass," Governor John Connally and several of his staff had themselves driven in an air-conditioned limousine to meet the marchers while they were still some fifty miles from the Capitol, marching in 100-degree heat. The Governor made it plain that he did not undertake the drive to welcome the marchers or praise their iron-willed perseverance, but simply to warn them that he would not be in his office when they arrived, because, as he told them, "I do not want to dignify what you are doing by being there to receive you."

The answer to their problems, the Governor told the marchers, lay in education. Father Gonzalez, himself a former farm worker, replied to the Governor, "It is the children of **los ricos** (the rich) who benefit by education, the children of the **campesinos** (farm workers) are too poor and hungry to benefit by it."

The Governor then left, as an aide expressed it, "to enjoy a brief, well earned vacation." The Governor spent the vacation dove-hunting in the brakes of South Texas.

Following the march into Austin and the rally on the Capitol steps it was decided by the marchers to leave two of their number behind to mount sentry duty on the Capitol steps in a vigil of prayer until January, when the Texas legislature meets and a bill will be introduced to bring Texas field hands under the protection of a $1.25-an-hour Minimum Wage Law. The sentries in the continuous vigil of prayer and reminder will be rotated week by week until January. The first two sentries, Reyes Alaniz, 62; and Benito Travino, 52; were instructed in their duties by Father Gonzalez and widely quoted in the Texas press. "There are two million farm workers in Texas who are depending on you. I want you to carry yourself as men. Stand tall, and quietly, and with dignity. And stand in the sun, do not stand in the shade, you are **campesinos** and used to the sun."

Questioned later by newsmen on how he happened to be chosen for the vigil, Reyes Alaniz said, "My companions decided that since I had thirteen children I would need the money badly since it was also decided that our families should not suffer because the vigil was undertaken. So I am here."

Asked by the newsmen how much he was being paid for the vigil, Alaniz smiled and said, "More than I have ever before been paid in my life as a campesino. $1.25 an hour. **Por la justicia y la dignidad.**"

The leader of the NFWA in Wisconsin is Jesus Salas, only 22, but educated by many seasons in the fields and several years in college. The big growers in Wisconsin (Libby's, Chicago Pickle Co., Marks Brothers, Dean Foods, and others) pay wages often under $1. There are of course no insurance or medical benefits. There are over 20,000 farm workers for the harvest, and most are migrants, Mexican-Americans.

In mid-August, a group of 30 farm workers decided to have a march in Wisconsin, to wake up the growers and officials, and to protest the low wages. They set out from Waushara County (one of the worst in the state) to the State Capitol, a distance of 90 miles. Along the way they explained the cause to thousands of other farm workers, and many hundreds joined in the march.

Over 500 attended the rally on the Capitol steps in Madison, and state officials promised to help them.

Labor News 10/2/66

New Farm Workers Organizing Group Is Now Chartered

CHICAGO — The United Farm Workers Organizing Committee has been chartered by the AFL-CIO as "an essential step toward winning a measure of economic justice for farm workers."

The council declared, in approving the creation of the new organizing committee, that "another step" must still be taken—the inclusion of at least some farm workers in pending amendments to the wage-hour law and in the protection of the National Labor Relations Act, the unemployment insurance system and, for most part, the system of workmen's compensation laws.

The AFL-CIO will not be content, the council declared, until farm workers "have the same legislative safeguards and the same access to collective bargaining available to other workers."

The council cited the progress being made after generations during which the farm worker was America's "forgotten man."

The progress, the council said, is not fast enough and not broad enough but it will be stepped up.

The granting of the charter, the council said, symbolizes the fact that the plight of the American farm worker is troubling the conscience of America.

The statement was issued after a thorough report to the council by AFL-CIO Organizing Dir. William L. Kircher, who has been directly aiding the organization of farm workers in California, and Cesar Chavez and Larry Itliong. Chavez was president of the National Farm Workers Association, which has merged with the AFL-CIO Agricultural Workers Organizing Committee of which Itliong was a key official.

Both groups are currently involved in an all-out campaign to win a representation election at the giant DiGiorgio Corp. The new UFWOC was chartered as the new organizing committee to continue the campaign in California and elsewhere.

Labor Department To Improve Training And Manpower Services For Rural Workers

Labor News

WASHINGTON—The Labor Department is further expanding its efforts to improve training and other manpower services for rural workers, Secretary of Labor W. Willard Wirtz announced.

He said a rural manpower training specialist has been assigned to each of the 11 Bureau of Employment Security regional offices to aid State employment security agencies in the development of rural manpower training projects.

"More than a third of the Nation's unemployed and underemployed," Mr. Wirtz said, "live in rural areas and almost half of the families in these areas have a cash income under $3,000 annually. Many thousands of these poverty stricken farmers are achieving dramatic increases in income through special training programs offered them under the Manpower Development and Training Act," he said.

"In many cases the trainees, most of whom had annual net incomes of $1,200 or less, show an income increase of 50 percent or more in the first years after training. It is essential that we continue to develop new techniques to improve the skills and raise the economic levels of these rural families."

A great shift is occurring in the types of workers needed by agricultural employers. While day-workers are being displaced by technological changes, increasing and unmet needs have arisen for farm technicians, semi-skilled agricultural workers, and contract service workers. Rural areas must provide the manpower for this growing need.

Manpower development and training programs can provide some answers to these problems, particularly for two of the most significant ones which affect the working lives of rural workers:

1. The migration to urban centers of rural people ill-equipped to earn an adequate living; and

2. The rapid pace of technological changes in agriculture which demand expanded retraining of the farm work force.

Some of the actions which will be emphasized in the renewed efforts to alleviate rural poverty are:

—Experimental projects to move interested and qualified unemployed or underemployed rural workers to areas where jobs exist;

—Overall community programs, to provide a wide range of employment services to unemployed and underemployed rural workers;

—Comprehensive training programs for rural workers to up-grade their farm skills or to prepare them for other available occupational opportunities;

Labor News Oct 7, 1966

CURBING SPECIAL corporate tax breaks and rolling back prime interest rates, will help break the depression in the nation's home-building industry, AFL-CIO Research Dir. Nathaniel Goldfinger (center) told Hobart Rowen (left) of the Washington Post and Alan Adams of Business Week magazine on Labor News Conference. The interview is a weekly AFL-CIO public service production on the Mutual radio network.

Labor Secretary Willard Wirtz Discusses Labor Situation With Florida Citrus Group

WASHINGTON—Secretary of Labor W. Willard Wirtz met today with representatives of the Florida citrus industry regarding its harvest labor needs in the coming season. The industry expects a crop increase of approximately 18 percent this season, and its representatives told the Secretary that a substantial increase in the work force would be needed.

The Secretary approved a request made by the industry to continue, for another year, the special wage formula which he accepted last year. The formula, calling for a minimum average rate of $1.50 an hour for all workers during a given pay period, replaced an earlier formula setting a guaranteed minimum wage of $1.15 an hour. The wage formula must be offered by employers if they are to be eligible for foreign farm workers.

"Last year's experience with the formula proved to be a very successful one," the Secretary declared, noting that thousands more American workers were recruited for the crop than in the previous year. He said that the average wage for orange pickers, which industry records show to have been $2.07 an hour for the season, had attracted many new workers to the groves.

The citrus industry representatives discussed the possible need later in the season for off-shore pickers with the Secretary. The particular labor needs of the fancy fruit portion of the industry were explored in detail.

The Florida delegation told the Secretary that it expects a citrus harvest of 164,000,000 boxes, this year compared to last year's production of 140,000,000. The greatest rate of increase within the citrus crop will be of fancy fruits, the group told the Secretary.

The Secretary indicated his appreciation for the extensive efforts made by the industry to recruit the needed workers throughout the southeastern states.

DIOCESE OF MIAMI
OFFICE OF COMMUNITY SERVICE
240 SECURITY TRUST BUILDING
110 E. FLAGLER STREET
MIAMI, FLORIDA 33131

October 21, 1966

TO: PARTIES INTERESTED IN THE MIGRANTS

FROM: REV. MARTIN A. WALSH

SUBJECT: MEETING FRIDAY, OCTOBER 28, AT STS. PETER & PAUL CATHOLIC CHURCH - 2:00 P.M. TO 4:00 P.M.

There will be another meeting of the various groups working in one way or another with the migrants, October 28, 1966, from 2:00 P.M. to 4:00 P.M. at Sts. Peter & Paul Catholic Church (Auditorium), 1435 S.W. 12th Avenue, Miami, Florida.

The purposes of the meeting will be as follows:

1. To discuss the enclosed Resolutions.

2. To discuss the steps to be taken by the various concerned groups between now and the IUD Board meeting of November.

3. To discuss among the groups and the farm workers general approaches and strategy to be employed in the coming months.

4. To set up a permanent committee composed of members of the concerned groups whose function will be to implement the program adopted at this meeting.

Since we feel that the meeting is of utmost importance, we trust that you will make every effort to be present.

For the meeting to be as fruitful as possible would it be possible for each one to bring two or three farm workers who have exhibited leadership qualities to be present with you at the meeting.

I. Farm Labor Organizing
II. The Ground Is Our Table, a book on farm labor by Steve Allen

I. FARM LABOR ORGANIZING

California

Grape fields and storage plants continue to be the focal points of farm labor organizing in California. Over a year ago workers demanded higher wages and union recognition from some 33 growers. Early targets of the strike were the two largest ranches, Schenley Industries and the DiGiorgio Corporation; both have since agreed to the concept of collective bargaining, although much still needs to be worked out with the far-flung complex of DiGiorgio ranches.

Representation elections in the DiGiorgio fields had been accompanied by the divisive tactics of the International Brotherhood of Teamsters. The two initial farm unionsthat had committed themselves to the strike (the National Farm Workers Association and the Agricultural Workers Organizing Committee, AFL-CIO) merged into the United Farm Workers Organizing Committee, AFL-CIO, to bring about greater unity of farm workers and to more effectively oppose the Teamsters' late attempt to woo them.

The United Farm Workers Organizing Committee defeated the Teamsters at DiGiorgio's Sierra Vista and Borrego Springs ranches on the 30th of August, 1966, but the right to an election has to be fought for at each DiGiorgio ranch. DiGiorgio's 9100-acre Arvin Ranch became the next center of controversy. DiGiorgio initially claimed it was in the middle of a union rivalry, and refused to proceed with the election unless both unions were represented. The Teamsters finally withdrew, and an election date was set for November. The workers were to vote simply "yes" or "no" on whether they wanted UFWOC to represent them. A comfortable majority voted "yes." The contract that will be discussed includes a UFWOC no-strike pledge, and if the two parties cannot agree on the terms within 45 days, negotiations will be referred to arbitrators. A fourth DiGiorgio ranch at Marysville, in Yuba County, will have elections in its fields on July 7, 1967.

A consumer boycott, endorsed by the Executive Council of the AFL-CIO, has been launched by UFWOC against the products of Antonio Perelli-Minetti, his sons, and their 26 private corporations. Field workers went on strike September 19 at the 1500-acre ranch in McFarland when the company refused to recognize the United Farm Workers Organizing Committee as bargaining agent. According to UFWOC's Delano Newsletter, "After the fields had remained empty two days, local labor contractors provided strike-breakers who were driven into the fields--through our picket lines--on Teamster buses with Teamster representatives acting as armed guards." William Grami, director of the farm worker division of the Teamsters, then announced that the Teamsters had signed a contract with the Company and represented the workers. The strikers had not been consulted about the contract.

co-chairmen: Frank P. Graham • A. Philip Randolph • treasurer: John A. Mackay • assistant treasurer: Robert W. Hudgens • committee: Steve Allen • William L. Batt, Jr. • Louis H. Bean • Robert Coles • Helen Gahagan Douglas • Rev. Walter E. Fauntroy • L. H. Foster • Rabbi Roland B. Gittelsohn • Henry B. Herman • Msgr. George G. Higgins • Jacob M. Kaplan • Rabbi Eugene J. On October 14, packing shed workers at the Hourigan-Mosesian-Goldberg plant, denied recognition of UFWOC as their bargaining agent, walked out and joined field workers who had been striking since September 18. The state had certified the field workers' strike as a labor dispute on September 28, and picket lines were set up to discourage truckers from picking up or delivering grapes to the struck ranch. The system proved effective despite Teamster pressure on their drivers to cross the lines, and repeated breaking of the lines by Delano police. While the shed workers' election awaited National Labor Relations Board action on UFWOC's petition, Goldberg agreed to an election for field workers. On November 15, UFWOC again won overwhelmingly, 285-38.

In the most violent act against the strikers, a picket, Manuel Rivera, was critically injured when a truck carrying scab grapes was ruthlessly driven through the picket lines. No arrest was made. It is to the credit of the farm labor union, with its deep commitment to nonviolent tactics, that the brutal act met with no retaliation.

Texas

The farm labor strike for $1.25 an hour, begun in June by workers who have since affiliated with UFWOC, continues against 12 growers in Starr County.

Latest developments center around the flow of Mexican nationals who cross the border daily to work in the United States. These "green-carders" (so-called from their green visa for permanent entry into the U.S. under provisions of Public Law 414) are similar to the braceros previously admitted under Public Law 78 in that they contribute to keeping the farm wage scale low in areas near the border. Although permitted to remain in the U.S., many "green-carders" recross the border each night, and since they can live more cheaply on the Mexican side, they are competing unfairly with the American workers who cannot live on the same low wages.

On October 24, about 60 American farm workers walked onto the International Bridge at Roma and convinced many of the Mexicans crossing from the other side that they were "taking the jobs of others and helping the bosses win the strike." Two of the leading organizers, Eugene Nelson and Bill Chandler (both of whom worked on the Delano effort before coming to Texas) were arrested for blocking the bridge.

Franklin Garcia, of the Amalgamated Meat Cutters and Butcher Workmen, gave an example of the degree of success: a La Casita Farms bus normally picks up 35 to 40 Mexicans workers at the Roma bridge each day. On the morning of October 24 "the bus was there, but after explanations were started at 5:30 a.m., only six people got on that bus by 8 a.m. Because it was successful, the growers called the sheriff of Starr County to stop the explaining." Mr. Garcia announced that other AFL-CIO unions will join in similar efforts at other international bridges along the U.S.-Mexico border to convince Mexicans to refuse to work for less pay than Americans.

Bulletin! On November 16 a report issued by a Starr County grand jury called the Texas farm workers' strike "unlawful and un-American," and "abusive of rights and freedoms granted them as citizens" (New York Times, November 18, 1966). The jurors continued, "The means as are practiced by the union group...are directly contrary to everything that we know in our American and lawful way of life." They called for the President to send men to the area "to assist in preserving the rights of all concerned" and for representatives of the attorney general's office and a Texas Ranger to remain in the county to assist local officers "during these extraordinary times."

In contrast to these incredible statements the facts speak for themselves. Farm workers in Texas are exercising a basic right that is protected by law for most other workers--the freedom to organize and bargain collectively. The report com-

plains of violence and threats on the part of farm workers. There have been absolutely no worker-instigated incidents of violence; even at a rally of 8,000 farm labor sympathizers (which Governor Conally refused to endorse for fear of violence) the audience was orderly and attentive.

Wisconsin

Successful efforts to increase Wisconsin's hourly minimum wage have been made as a result of protest demonstrations led by the United Workers, an affiliate of the United Farm Workers Organizing Committee.

As one indication of the opposition's sentiments, according to the Milwaukee Journal, "At a meeting of the Wisconsin Better Government Committee...a resolution was adopted which said the migrants enjoyed 'more freedoms than the average American.'" Recording secretary for the meeting, Karl E. Koehler, said it was "not too difficult for a person to go in and make $3 an hour" picking pickles. This has the whole aspect of going up north for a two month vacation and getting paid for it," he said. The resolution further advised the legislature to be "extremely cautious in legislating away the freedoms of one of the few remaining free groups in this country."

It is scarcely believable that anyone could describe labor involving bending over, picking, and carrying heavy baskets in the hot summer sun a "two-month vacation" with pay. Picking pickles is considered one of the most arduous of stoop-labor tasks; the vines are tough and close to the ground, and heavy gloves must be used.

A survey conducted by Mrs. Elizabeth Raushenbush, chairman of the Governor's Committee on Migratory Labor, came to conclusions very different from those of the Wisconsin Better Government Committee. According to the November, 1966, report, a migrant working in the cucumber fields of Waushara County earned an average of less than $20 a week in 1964. She added, "Because of an excellent growing season, earnings may have been slightly higher in 1966 than in 1964, but the structure of the industry and the structure of the labor market have not changed significantly since this study was made."

On November 10, 1966, the State Industrial Commission, empowered to set the minimum wage for all women and children, approved a $1.25 minimum to go into effect February 1, 1967. Minors under 18 will receive $1.10. Under the new law at least 65 per cent of those women farm workers covered must receive $1.33 next year.

Jesus Salas, leader of the August march that sparked the action on minimum wage, has continued his efforts to organize farm workers. On October 10 Salas' organization demanded recognition of its union from James Burns and Sons Company, a potato warehouse firm. Clergymen and AFL-CIO representatives joined the pickets, but the effort was abandoned. Salas said the picketing had been started too late in the season, "a tactical error in timing," but that it would resume next year.

New Jersey

Early in September, 1966, grower reaction to the presence of VISTA Volunteers in Cumberland County fields touched off a flurry of public protest. The VISTA Volunteers came up from Florida with Negro migrants as part of an antipoverty program called Upstream, which develops child care centers, reading classes, and other services for migrants. Only 11 of some 35 to 40 growers allowed the VISTAs on their property; most farmers were wary of the sympathy between the VISTAs and the labor union organizers who had been at work in the state. (The organizers' aim was to get enough workers to sign union cards so they could ask the National Labor Relations

Board to conduct an election on whether a union was desired. The campaign proved most successful where VISTAs had been allowed in the camps earlier.)

Louis Pizzo, major Cumberland County grower and member of the Governor's Migrant Labor Board, barred VISTA Volunteers from his fields and shouted: "See those people in the field, well they're nothing, I tell you, nothing. They never were nothing, they never will be nothing, and you and me and God Almighty ain't going to change them. They gave me the bottom of the barrel and I'd fire them all, clean them from the fields, if you'd get me someone else." Pizzo was also quoted as saying: "But I'll tell you one thing, there's no place on this farm for anyone with a union card--and I've told my people as much....If I have to deal with a union, I'll shut the whole damm place down. You can't run a farm with unionization."

After mediation by aides to New Jersey Senator Harrison A. Williams (Chairman of the Senate Subcommittee on Migratory Labor), Pizzo agreed to let the VISTA Volunteers have access to his workers. Aroused civic leaders nevertheless demanded Pizzo's resignation from the Migrant Labor Board.

According to the Trenton, New Jersey Sunday Times Advertiser (September 11, 1966), "Although the dispute between Pizzo and the VISTA contingent was reported settled, a new controversy gained momentum. The New Jersey Consumers League accused the Migrant Labor Board of failing to exercise leadership and authority as prescribed by state law. In a letter...the League endorsed Governor Richard J. Hughes' request for a report on the Pizzo controversy from John N. Seabrook, Migrant Labor Board chairman. But the organization urged the governor to extend the probe to 'other allegations in recent press stories of bad housing, child labor in the fields and disregard of the right of farm workers to organize and bargain collectively.'"

Another Migrant Board member, farmer Edward B. Fogg of Salem County, was found guilty by the Board of 22 violations of the housing code and fined $50. (He could have received a fine of $200 on each count.) Among other things, he was requested to repair a hole in the wall of one building, replace broken windows, install hot and cold running water, and make a privy fly-proof.

During a public meeting held by the Migrant Labor Board, witnesses described conditions under which many workers are forced to live. A social caseworker from Monmouth County told of migrant workers and their small children who were abandoned in an isolated camp by their crew leader; they received no wages, and were told by the farmer to live off the potatoes in the field.

A local welfare director in Gloucester County refused at first to pay for the burial expenses for a dead infant of a Puerto Rican migrant couple. The director was quoted as saying: "Puerto Ricans should practice birth control." The director, Mr. Leonard, was finally persuaded to bury the baby, but failed to notify the parents of the funeral. The couple thought their infant was still in the hospital mortuary , and did not learn it had been buried until a County nurse came to the fields and informed them.

Although the Governor has appointed a task force to investigate farm labor conditions, no reports have been issued.

Bulletin! Mrs. Lonnie Allen, president of a New Jersey farm workers conference, has been ordered out of her house, owned by prominent Cumberland County farmer Maurice Uhland. Uhland was recently fined $50 by the state for housing violations which included "an overflowing cesspool and gross rat and roach infestation." Mrs. Allen is certain the eviction of her family of 15 is a result of her work as head of SCOPE (Southern Citizens Organization for Poverty Elimination, composed of 50 migrant farm

workers). In a telephone interview with a New York Times reporter, Mrs. Uhland first asked, "Are you white or colored?" She called Mrs. Allen a "troublemaker," and continued, "Why should I house those kind of people?"

Though most of the seasonal workers have returned to the South, growers have already nailed up "No Trespassing" signs all over the county, doubtless in an effort to discourage union organizing activity next year.

New York

Funeral services were held on September 28 for two migrant farm laborers from Puerto Rico, who were burned to death in the tractor shed in which they had been living at a farm labor camp near Brocton, New York. The fire was started by an old pot-bellied, wood-burning stove; the walls of the shed were not insulated. A third man escaped death by climbing out of a window. He is still in critical condition, with 3rd degree burns covering 20% of his body from the waist up.

During the summer months roughly 2,000 farm workers live in the shanty town around Brocton, a small farming community south of Buffalo. Many of the workers are Puerto Rican men who leave their families for the summer to pick the crops on the East Coast. They work a 17-hour day, six days a week. Felipo Molina, a worker who has spent 17 summers in the Brocton area, says that in a good year, March through October, he ends up with $300 to $400. And in a bad year? "I buy for eat. I send my family. I have for transportation home. That -- that is all."

Don Hillegas, student at Fredonia State University and member of the Campus Americans for Democratic Action, spent all summer trying to improve housing conditions in the area. According to him, "Many of the workers actually live in chicken coops and deserted garages. I have seen the housing inspectors tell the owners 'clean them up or get the people out'; but that same inspector never pays a second visit and conditions remain the same."

Buffalo's State Assemblyman Arthur Hardwick, Jr., and other members of a joint legislative committee toured migrant labor camps a week after the fire. The committee found two camps operating that had never been issued permits. One had an "open well about 20 feet from a septic tank which was overflowing white sewage onto the nearby grass. Rat holes were found, and old newspaper mats covered the ceiling" (Fredonia-Dunkirk Evening Observer, October 10, 1966). The other camp had no bathing facilities.

Commented Hardwick: "...Health officers throughout the state are serving at the pleasure of county officials....Enforcement should be on the state level, rotate the men to make them more effective and to keep them away from political ties." Hardwick also recommended that the number of workers required before housing would come under farm labor housing rules be cut from five to one. "If this were done, then the camp in Brocton would have come under the county jurisdiction."

According to recent reports, some 75 farm workers have been signed up the United Steelworkers of America, which has 9 locals and 5,000 members in the Dunkirk area. Joe Granto of the Steelworkers gave early support to organizing farm workers. "Who are we not to help someone in trouble?" he explained.

The seeds are there in Brocton for a successful organizing effort: the migrants themselves have a strong and articulate leader in Mrs. Lares Trejan. It is she who sought out Joe Granto, who went on the local radio station asking her people to

refuse to work on the day of the funeral, who sees the importance of unity among the workers. With hard union support, a dedicated core of citizenry, and the concern of legislators such as Arthur Hardwick, a farm workers' movement in New York State can become a reality.

****

The National Advisory Committee on Farm Labor is at work on a report on farm labor organizing--past, present, and future--in which other areas of the country will be treated in some detail. Please send us reports and news articles on farm labor organizing, and also any other clippings pertaining to farm labor issues in your area.

II. THE GROUND IS OUR TABLE

The Ground Is Our Table, by Steve Allen, with photographs by Arthur Dubinsky (Doubleday: $3.95, 140 pages).

In this short, fact-filled story of the American migrant worker Steve Allen has cut through the maze of detail to the human injustices perpetrated on over two million American field workers. He has succeeded in achieving the difficult balance between human concern and factual reporting; his compassion for these impoverished Americans is accompanied by persuasive evidence that better working and living conditions are not problems of finance, but problems of conscience.

NACFL recommends this book highly; its personal style will make it excellent reading especially for those who are not yet aware of the plight of America's farm workers.

Metairie, La. 70005

NEW YEAR'S DAY 1967

THE LOUISIANA STORY

For the third time in 100 years, the sugar cane plantation workers of Louisiana are organizing a union. Over 500 tractor drivers have made applications for membership and some have paid $1 on their joining fee.

The first effort to organize occurred in 1879, when the former slaves marched through the sugar cane plantations calling on all to strike for higher wages. The Governor of Louisiana called out the militia and the strike leaders were sent to prison on charges of trespass. A year later they were pardoned, after a petition was filed by Mr. Demas, a Negro member of the Legislature from St. James Parish. (Appleton's Cyclopaedia 1880, Page 482)

The second union was broken in 1953, by local court injunctions based on a specious theory advanced by Richard Nixon that - since farm workers were excluded from protection by the labor laws, they had no right to organize or strike during the harvest season. Our National Agricultural Workers Union appealed the injunctions on a pauper's oath, after both A.F. of L. and C.I.O. refused to pay the costs of an appeal. Dan Pollitt wrote the brief, my wife, Dorothy, cut the stencils and I mimeographed the petition to the U.S. Supreme Court which set aside the injunction, but two years too late to save the sugar workers' union.

UNION REPRESENTATION
SELF HELP HOUSING, A CREDIT UNION
SUGAR PLANTATION WORKERS

This time the sugar workers' organization is based on a three point program as follows:

1. An organization is being formed, mainly by skilled farm machine operators, to secure increased wages and better conditions. It is proposed to open negotiations with the employers once the Union represents the majority on all plantations. (There is a labor shortage and skilled farm machine operators cannot be replaced)

2. A credit union organization is being formed to free the plantation workers from debt to loan sharks and others. The Southern Regional Council and others are assisting in the preliminary educational work.

3. A program to re-house rural families in the sugar cane country is under way. The Farmers Home Administration has given approval to a self-help project to construct the first 10 units of individual homes located on a tract of land near Edgard, La. (104 applications for loans to such families were on hand in FHA offices on Nov. 25th.(Letter from John A. Baker, Assistant Secretary of Agriculture) An announcement will be made as soon as construction gets under way.

As usual, I have tried to be the man behind the scene to help carry out the good ideas such as the above. In the sugar plantation country we are fortunate in that we have Frank Lapeyrolerie, an outstanding Negro leader, described as "The Man Who Gets Things Done." Frank was a leader in the 1953 strike and was, as he is today, Secretary-Treasurer of the Local Union.

FARM WORKERS IN CALIFORNIA

Early last year I was sent out to California by the International Union to make a survey and report on organization of farm workers. I went to Delano, took a turn on the picket line, and for the first time met Cesar Chavez, the colorful and able Mexican-American organizer of farm workers. I learned that Chavez, as a young man just out of the armed service, was among the 40,000 cotton pickers in the Central Valley who went on strike in 1949 against a wage cut, and won. The strike was led by our union organizers Hank Hasiwar and Ernesto Galarza. Soon after my visit the March to Sacramento occurred and Chavez's union, then the National Farm Workers Association, (independent) won a contract for farm workers in the Schenley grape vinyards. In 1950, our Union also organized Schenley workers and lost. When we threatened to boycott their products, the Schenley Labor Relations man laughed. He said he had more influence with the AFL than our Union did - and he was right.

There are those who express the fear that now "Hoffa has been shot out of the saddle" the Teamsters will soon return to the AFL-CIO and under new leadership will use their power and connections with corporate agriculture to organize the nation's farm workers, leaving Chavez and the United Farm Workers' Organizing Committee with only a piece of paper hanging on the wall of some shack in a farm worker town. We hope this will not happen!

I MET OLD FRIENDS AND ASSOCIATES

While on my way out to California, I stopped over in Arizona for a visit in Tucson with Clay East, the first president and the man most responsible for the organization of the Southern Tenant Farmers Union. I also visited with J.R. Butler, the long time president of the STFU, now retired and living in a small home among citrus trees in Phoenix. Clay East and I had dinner with Dr. Dave Minter, a refugee from Mississippi. Dave is still practicing medicine and is also helping to run a migrant clinic near Tucson.

I had a brief visit with Ernesto Galarza in Los Angeles and lunched with Alexander H. Schullman, the attorney who represented our Union in the long strike against Di Giorgio in 1947-48. Later, I spent an afternoon with Ann and Hal Draper at Berkeley, and then met Bill Becker in Sacramento. Bill was on Governor Brown's staff. He organized the Schenley workers in 1950, and led the first strike. I also had a short visit with Don Grubbs who wrote his Ph. D dissertation on "The STFU and The New Deal." It has never been published because Don can't find time to cut it down to the right size.

SHARECROPPERS OF THE SEA
NOW HAVE A UNION

During the year I continued to work with menhaden fishermen. About 400 of these pogy boat men worked under union contract in 1965 and 1966. The Union had bargaining rights for an equal number but because of the weakness of the National Labor Relations Act and its poor administration in New Orleans, influenced by a firm of legal bandits, it has been impossible to get a decent contract for about half the men. Now that there is a real labor shortage up and down the Gulf Coast, these men stand a good chance of a better deal in the New Year. The Union also has new contracts covering dairy workers in Bogalusa and Lake Charles.

A BUSMAN'S HOLIDAY

After travelling almost constantly during the year, in late November I had a busman's holiday - travelling to Atlanta, Chapel Hill, Washington, New York and Philadelphia, then to Chicago and Memphis.

STFU RECORDS AT UNIVERSITY OF NORTH CAROLINA
LIBRARY, CHAPEL HILL

While in Chapel Hill I had an opportunity to see the way the old union records are kept. There are about 80 boxes of correspondence, documents, etc., all arranged under subject matter and date. The director of the Southern Historical Collection seems to think that these files containing letters from sharecroppers of the 1930's about their problems was a great find. Important people save their papers, but the records of the poor are seldom preserved. Through the years I had tried to keep every piece of paper that came our way. As a result, the historians have something

to use and to quarrel about. At least, no serious historian can write about the South in those years without describing the role of the STFU and those who had a part in it.

HISTORY BEING WRITTEN

Historian George Tindall at the University of N.C. is writing a book on the history of the South in the 1930"s. I read the chapter on the New Deal agricultural program. To me, his presentation of the role of the STFU seemed to be fair and objective. His book is one of a series on the South from colonial days onward. Most of the series have already been published. Howard Kester's "Revolt Among the Sharecroppers" has become the authority on the early days of the Union,

"LABOR & LIBERTY" BY J.S. AUERBACH

There is a recent book which covers the STFU role in the origin of the LaFollette Civil Liberties Committee. It is by Jerold S. Auerbach, history professor at Brandeis. The title is "Labor and Liberty", published by Bobbs Merrill at $6.50. It is quite good but it seems to subscribe to the devil theory of history. To him, the STFU was merely an expression of the Socialist Party in opposition to the New Deal, rather than a people's movement.

A NEW PEOPLE'S MOVEMENT FOR THE RURAL SOUTH

As I travelled around last November and talked to old friends and new ones, I found a universal need being expressed. I want to do something about it.

Everyone agrees that there is a need for a southwide organization to unite those organizations and people native to the South who want to bring about economic change among rural people.

Now that the civil rights and expanded social welfare laws are on the books, the time for demonstrations has passed. The time has now come for building organizations which can change the lives of the rural poor. The country is aware of the needs of Negroes and to a lesser extent, the Mexican-Americans, because of those demonstrations. We need to reach the poor whites in the rural areas of the South for they too, are the victims of economic insecurity who find expression in bigotry, prejudice and hatred. They are being exploited by political demagogues like George Wallace of Alabama. The Populists of the 1890's, the IWW in the decade prior to World War I, and our own STFU in the 1930's found a way to unite people in the rural South, regardless of race. While it will not be easy, I know it can be done again.

Then there are numbers of young men and women, many of whom were in the civil rights movement who could again be mobilized to help form a poor peoples' movement to bring about economic change. I am sure there are dozens who would be willing to go into the rural areas all over the South and work for a period of two years in building organizations of, by and for the people. But they would have to have a part in the organizations and in developing its program. Young people are too sophisticated these days to want to give even a part of their lives to build just another credit union, just another co-oO, or just another trade union that is merely an extension of the present power structure. They want an independent organization of, by and for the rural poor. Early in the New Year we hope to get a few people together to do some preliminary talking and later on, perhaps have a south-wide meeting.

All good wishes for the New Year.

Sincerely,

H.L. Mitchell

2-11-67

Texas Farm Workers Press Strike, Boycott

AFL-CIO 2/11/67

Rio Grande City, Tex.—Striking South Texas farm workers are counting on pickets, a public boycott and the growing support of the clergy to win a union contract from the corporation-owned La Casita farm, which sprawls along the U.S.-Mexican border.

Strikers and their supporters, including priests and ministers, have been hauled off to jail—in company pickup trucks when police patrol cars were filled. But the AFL-CIO's United Farm Workers Organizing Committee has responded by stepping up picketing and challenging a state anti-labor law banning "mass" pickets.

The consumer boycott is aimed at the vegetables and melons grown at the struck farm and marketed under a variety of labels. The workers have been on strike since last spring and many are veterans of a 400-mile march to the state capital in Austin last summer which drew national attention to their plight.

The UFWOC has responded to a campaign of harassment and arrests by mass picketing at the entrances to the big corporate farm, which is a subsidiary of Harden Farms of California.

The pickets are undaunted by Texas Rangers, who have been stationed in the area since the strike began, and local law officers. But La Casita did erect a fence across what had been a public road to

(Continued on Page 2)

(Continued from Page 1)

keep pickets farther from the entrances.

A La Casita official said that the farm owned the road.

The latest arrests included five Catholic priests from San Antonio, and five strikers. They were taken into custody for calling out to non-strikers in the La Casita fields to persuade them to quit work and join the strike.

The priests and strikers were on private property adjoining La Casita with permission of the owner when they were arrested. They were booked for disturbing the peace—two miles from the nearest house.

Pres. H. S. Hank Brown, of the Texas AFL-CIO immediately called for an investigation of the arrests by the Justice Dept., and such an investigation has reportedly begun. Two of the priests reported that Justice Dept. agents had contacted them and taken depositions.

La Casita grows and markets lettuce, celery, carrots, peppers, tomatoes, melons and other vegetables under several names including La Casita and Hi-Goal.

What makes the boycott especially difficult is that these brand names rarely appear on the grocer's shelf. The merchandise is sold and shipped in bulk under these names and then repackaged in small quantities by jobbers or grocers.

UFWOC is attempting to trace vegetable shipments to grocers. The union then plans to put informational pickets at the stores selling La Casita products.

The arrest of the 10 persons last week was just the latest act of harassment against the striking farm workers.

Two weeks earlier two strike leaders were pulled out of a small group of strikers gathered near a gate to La Casita and thrown in jail.

In protest, other strikers, marched and prayed outside the run-down, old Starr County jail during the night and four of those praying were also arrested.

Late last year 10 people, including several students and strike leaders Tony Orendain and Bill Chandler, were arrested and spent over a week in jail before being released on bail. Last summer, the farm workers dramatized their plight and their desire for a union by staging a 400-mile march from Rio Grande City which began on the Fourth of July and ended with 20,000 Texans joining them on the State Capitol steps on Labor Day for a giant rally.

UFWOC organizers, and the strikers themselves, have continued to emphasize that their goal is a union contract with La Casita, which employs about 300 persons regularly and up to 500 seasonally.

But their struggle also has called attention to their low wages and the fact that Texas has no general wage and hour law. The legislature for the first time is giving serious consideration to passage of such a law.

Agriculture

The Rise of a Farm Workers Union

by David F. Selvin

Once again, as they have so many times in their agonized past, California farm workers have a union of their own. They have sustained a strike for recognition and union rights deep into a second year. They have won path-breaking collective bargaining agreements. In one immeasurably significant victory, they have captured a major citadel in the growers' open shop. The future of their brave young union, given any decent measure of help, seems bright.

Other generations of farm workers have won their strikes and written union contracts. They have counted their members in tens of thousands and spanned great stretches of California's green and golden valleys. But their unions were shattered, their contracts torn up, their members scattered. Bitterly, inevitably, they were forced back into the unending competition of too many people for too few jobs, the low wages, the miserable housing, the school-less, doctor-less, near hopeless grind of poverty.

Will it happen again? Is the United Farm Workers Organizing Committee, in fact, the "effective and permanent union for agricultural workers" that the AFL-CIO Executive Council saw on the horizon a year ago? What are the odds that this union, unlike its countless predecessors, can survive the enmity of these wealthy and powerful employers?

A half century of failure argues against it. The casual, disorganized, uncertain labor market in agriculture multiplies the difficulties. The lack of legal sanctions for unionism in the fields strengthens the employers' stubborn, unchanging resistance. Employers show no signs of giving up the weapons of war they have wielded these many years: the strikebreakers, armed guards, influence with (or over) local authorities, arrests, injunctions. Poverty, chronic underemployment and migration, as they always have, withhold resources of money, political weight and manpower from the union.

On the other hand, the emergence of an almost totally domestic workforce and the drastic reduction of imported labor hold promise of more unionism rather than less. Relatively high levels of industrial employment help to reduce competition for jobs and toughen the farm workers' bargaining power. Rapidly developing mechanization of farm production should add still more strength, but it will also reduce job opportunities.

Beyond these factors, though, perhaps the strongest

DAVID F. SELVIN is editor of San Francisco Labor. He has reported on the conditions of farm workers for many years. He also has authored biographies on Samuel Gompers and Eugene Debs for young readers.

argument that unionism will extend its beachhead is in the record of these last 19 months. Few thought it was anything but another local dispute in September 1965, when the then Agricultural Workers Organizing Committee called a strike in the vineyards around Delano, in the southern end of California's great central valley. It was joined on strike soon after by the National Farm Workers Association.

AWOC was the remnant of an earlier AFL-CIO union drive. NFWA was more of a community organization, oriented more toward welfare than unionism. AWOC was largely Filipino in membership, NFWA largely Spanish-speaking. The former drew union support, the latter involved church and civil rights groups as well.

Still, this unlikely combination hung together and, somehow, saw the strike through its first winter. They survived the police bullying, the harassment of their pickets, the growers' strikebreaking efforts. They survived frequent days when the strike larder was low and the winds on the valley floor were cold and biting.

As spring came, the strikers began a march to Sacramento, the state capital some 300 miles to the north. It was a demonstration, a protest, a cry for help.

On Easter morning, on the capitol lawn, the few score who had set out a month before were multiplied a hundredfold and more. They came from every corner of the state and from every walk of life to give witness to the cause.

That morning they cheered the announcement that Schenley, second largest of the grape growers, had yielded and recognized the union. They heard, too, that the giant DiGiorgio Corporation, biggest of the growers, made a first, tentative but at that time unworkable offer for an election.

Today, these farm workers—organized now in the AFL-CIO United Farm Workers Organizing Committee—hold a contract at Schenley, a second at DiGiorgio, a third in the making at Christian Brothers. They are pressing their fight against other growers by picket and by boycott, with whatever leverage they can bring to bear. It is a beginning.

Perhaps the DiGiorgio contract—resolved by lengthy negotiations and final arbitration in April—is the pattern of the future. Little in it is new—except for farm workers. Little in it hasn't been duplicated often in union agreements—except for farm workers.

Its wages will make no farm worker wealthy or—considering the seasonal nature of the work—particularly comfortable, but they will make his lot substantially better.

It represents a breakthrough against a giant of an employer and one who had successfully turned back every effort to unionize its farmhands. In that sense, it marks a 30-year high and an important precedent.

Even more important in the long run, though, is almost surely to be the hiring hall, with the contract provisions surrounding it and the beginning it offers of welfare programs for the agricultural worker.

Basically, the hiring hall makes the union the first and major source of labor for DiGiorgio. Employes with the longest continuous service are given preference in filling vacancies and in sharing the available work. Seasonal layoffs will not break the continuity of service.

If farm work is ever to provide a decent, year-round living, it must offer job opportunity not merely at the seasonal peak but, somehow, for all or a large part of the year.

Farm work is not the first to face this necessity. Longshore work, for instance, was no less casual. Yet it has been decasualized and regularized to provide a decent living 12 months a year.

In much the same way, farm work could be decasualized as well. It would call for a central source of labor, working closely with farm placement services and growers over relatively large stretches of agricultural country in crops stretching around the calendar. A government agency could set it up. Growers could do it if they cooperated in their labor use as closely as they do in fighting unionism.

However organized, though, it would be neither complete nor fully effective without a union and collective bargaining. No other way offers equal protection for the workers' interests or as great a potential for winning participation, cooperation and support. The hiring hall is the key.

The union is a key, too, to the development of welfare services. Here, as in industry, pooled funds encompassing multi-employer units—the larger the better—offer the most efficient means of developing the necessary health and welfare services. They can go far beyond anything a single grower or even a group of growers could reasonably offer on their own.

The DiGiorgio contract makes a start by instructing the company to apply for unemployment insurance for its farmhands. It sets up a fund for health and welfare services, requiring a $25,000 company contribution to start and five cents an hour per worker from January 1, 1967. Starting April 3, 1968, the fund may be used, as the parties decide, for health and welfare benefits, life insurance or pensions. So, in these rudimentary beginnings, the way is pointed toward bringing the farm workers into the mainstream of the benefits that are almost universally a part of every other job.

But many barriers remain. The California farmer for a good hundred years has made an abundant supply of cheap labor a cornerstone of his economic credo. He has gone to unconscionable ends to guarantee it.

At the start, migratory harvest hands reaped the wheat that grew in the state's hot valleys. Once the crop was in, they departed and were forgotten. As specialized crops replaced the "bonanza" farms, the Chinese supplied the growing demand for labor. The anti-Chinese agitation drove them from the farms and their places were taken at first by the Japanese, then by the Filipinos and Hindustani, the Italians and Portuguese and Armenians and countless others.

Through it all, the grower was guided by two major requirements: that there be more men than jobs; that between crops he would accept no responsibility for his temporary, however essential, employes.

Then the Mexicans came. The Great Depression sent many of them back to their native land. Their places were filled by a flood of Arkies and Okies fleeing the dustbowls and depression of the Midwest and the Southwest. By the mid-30s, California's farm labor force was almost totally native. A keen and perceptive observer of "factories in the fields" saw this new domestic workforce as a promise of a new farm workers' unionism. But it was not to be.

The grower had always fought unionism at every

Chavez on Unionism

"If the farm worker of America, especially the migrant, is to have any measure of his fair share of the good life, then he will have to struggle for it. In such a struggle, his greatest asset is himself and his fellow workers banded together in an organization dedicated to the mutual benefit and improvement of all.

"This is the definition of unionism. That is why the farm worker today is a unionist, devoted to the idea of unions and determined to make collective bargaining serve him and his family as it has served the best interests of workingman families for many years in this nation.

"Just as the strength of the worker is greater within a union, so is his union's strength greater within the family of American unions . . . the AFL-CIO. That is why the farm worker today is a unionist and an AFL-CIO unionist.

"Farm workers are determined to build a union of, by and for farm workers . . . one that can take its place with pride among the other unions in this great family and merit their support and respect in the process."

—Cesar Chavez, Director, United Farm Workers Organizing Committee

turn, with every weapon he could command. Hundreds of strikes had swept across the fields and orchards. Some won higher pay and many were defeated. Some unions gained a foothold, hung on precariously for a time, then were trampled under. Unemployment, two men or more, it seemed, for every job, undermined the unions' strength and made strikebreaking easy. Violence and vigilantes, hunger and want strengthened the growers' hand. Unionism clung in a few packing sheds and in the processing plants, but it was wiped out in the fields.

World War II drained agriculture of much of its workforce. An emergency program imported thousands of Mexican nationals to work the fields. The bottomless supply of labor, the grower-controlled contracts, the collaboration of government agencies all helped to stabilize wages. For most of the war, wages were held steady at about 1940 levels where they were not actually rolled back.

When the first wave of braceros was ended soon after the war, a new wave of "wetbacks" supplied the abundance of workers that broke the wage rates and prevented the farm worker from pushing ahead.

Then a second program of imported labor was undertaken under Public Law 78. Again, the growers were able to hold the line against wage increases and unionization. Finally, after several extensions and accompanied by the growers' wailing, Congress wiped out Public Law 78 on the last day of 1964. The growers seemed unable to believe that it was happening to them. They made virtually no preparations to replace the workers they were to lose.

In the five years between 1959 and 1964, contract foreign labor had supplied 26 percent of the state's seasonal man-year requirements—a great deal more in certain crops. In 1965, the proportion was cut back to less than 3 percent. Last year it was cut back even further—to less than 1 percent.

The number of domestic seasonal workers jumped from 105,000 to 120,000 between 1964 and 1966. A large part of the increase was among local workers.

There had been 10 recognized labor disputes in 1964, 57 in 1965. A partial count showed 466 domestic workers involved in strikes in 1964, 7,457 in 1965. Average hourly farm rates jumped from $1.35 an hour in mid-1964 to $1.54 in mid-1966.

This was the background against which, in September 1965, the grape pickers at Delano launched their strike. It set the stage for the next act, although in many ways it had already started.

Mechanization cut the workforce in cotton from 120,000 seasonal workers in 1949 to 25,000 in 1961. In 1964, the tomato harvester machine was in the final stages of development. In 1965, though, growers used 266 machines to harvest some 30,000 acres of canning tomatoes. The 1966 season saw about 800 machines harvesting well over 100,000 acres. An acre of tomatoes required about two man-weeks of labor in 1965 and less than three-quarters in 1966.

Speeded by a special appropriation, the University of California is spurring an extensive research program to put technology to even wider use. About 80 projects are looking into such devices as a grape harvester that jars fruit off the vine and a lettuce planter that picks up one seed at a time. The projects involve some 20 crops, including such fragile and highly perishable ones as grapes, peaches, cantaloupes, as well as tomatoes and lettuce.

They often spend as much time adapting crops to the machines as in designing and testing the machines. They are exploring, in addition to the grape shaker and the precision lettuce planter, a tree-shaking and fruit-catching system for picking peaches, a tree-shaker to bring down prunes and olives, mechanical methods for moving human pickers up and down trees and through orchards.

The research program, too, is working on a "tight-fill" system of shaking fruit into packing boxes in place of the laborious hand method. Mobile packing plants and countless varieties of conveyors and loaders are moving into the fields. Almost no crop is without some experimenting, some development of mechanical aids.

The higher skills that these machines are likely to require, along with their greatly increased productivity, hold out a prospect of higher pay. Skill in itself is a prime source of bargaining strength, of course; organized, it is even more powerful. The onsweep of technology, however, also reduces the workforce and job opportunities and puts a premium on higher levels of education and technical competence. These can, of course, be turned to the service of the union and its members and that is a main face of the challenge.

The need for some human labor in the fields and orchards, especially in California, is more likely to remain for some time to come. Feed grains and cotton

have proved particularly susceptible to mechanization, but vegetables and fruits are tougher crops to crack. California has a lion's share of these labor-intensive, specialized crops. But California growers are pushing mechanization hard even in these hard-to-mechanize crops. At best, they are bound to reduce the human labor needed to grow and harvest them; at worst, they will come close to eliminating it.

Beyond this, farms grow still larger. California had 7,000 fewer farms last year than the year before without a comparable fall in acreage. Manpower requirements are falling, even in the labor-intensive specialty crops which fell by a third between 1947 and 1965. Agricultural productivity mounts at a 5.5 percent annual rate.

A recent conference on farm labor yielded these predictions of things to come: ". . . the proportion of hired labor will rise while the total labor force will decline . . . farmworkers with improved training and skills will be in demand and . . . migratory labor will be reduced to a minimum with the growth of a regular labor force."

Thus, more and more, California agriculture takes on an industrial cast. Farm labor comes increasingly to resemble industrial labor and their problems increasingly coincide. Given some special requirements that are peculiar to agriculture. the gap between the two is nevertheless closing. As it does, the prospects of unionism brighten.

But mechanization and the changing structure of the workforce is only one major problem facing the farm worker and his union.

They suffer under liabilities imposed on no industrial worker, nor have they been for some 30 years. The farm worker is outside the unemployment insurance system. Only a small fringe of farm workers are covered by the minimum wage law. (The California law applies only to women and minors.) Similarly, he stands only on the edge of the social security system. In California, he has only recently been brought under the state disability insurance plan. A Senate subcommittee recently urged a re-examination and extension of workmen's compensation for farm workers.

Beyond this, the farm worker is penalized by low pay, aggravated by the seasonal and migratory nature of his work. He suffers in health care, housing, education for his children. He is compelled to live in slums and is denied an effective part in community life. He is exploited at every turn. Some tentative steps have been made in the direction of meeting his needs but they always seem too little and too tentative.

Most of all, the farm worker is denied the right given every industrial worker by law: the right to bargain collectively through a union of his own choosing. He is, in the main, excluded from the National Labor Relations Act. In the face of employer retribution, he has no appeal. In the face of employer resistance, he has no alternative but to strike. The DiGiorgio collective bargaining relationship was patched together largely by private parties—the representation election was conducted by arbitrators. It had no foundation in law, its sole official support the goodwill and informal intervention of friendly officials.

The upshot is that labor relations on the farm are more often conducted under the rules of jungle warfare than under the more civilized restraints of legal recognition and rational procedures. Such a setting is more appropriate to the longtime anti-union attitude of most California growers. It lends itself more readily to armed guards, police harassment, incitement to violence. It remains a high and craggy barrier to decent and democratic labor relations in the state's increasingly industrialized agriculture.

At bottom, the job of building a farm workers' union belongs to the farm worker himself. No one else has either the incentive or the opportunity to do the job or to do it as well. Yet, he is more urgently in need of the tools to do the job than any other American worker on the American scene today. The very poverty of his job, the almost total lack of legal protection, the almost complete denial of participation in the welfare aspects of this welfare society, the anachronistic anti-union attitudes of growers—all these put him in the disadvantaged position of the industrial workers of the early '30s and with even fewer resources.

If the farm workers' union is to survive in this unfriendly, even hostile clime, it will need a full measure of assistance. It will need money and organizers. It will need all the help it can muster to secure remedial legislation, to win an equal place in the state and national framework of rights and welfare. These last months since September 1965 have made it perfectly clear that, given this help, the farm worker is determined to make his union both permanent and effective.

Migrant Labor

Now It's "Huelga!" in Texas Too

Organized labor is giving full support to striking farm workers in the Rio Grande River valley, who have been subjected to "inhumane treatment . . . both by employers and by some local government officials," it was announced by Pres. H. S. Hank Brown of the Texas State AFL-CIO.

And "out of humanitarian consideration, we urge other groups and individuals to do the same," Brown added.

The cry of "Huelga" by Central California grape workers is being echoed in the South Texas valley, where the plight of laborers on the melon farms appears to be even worse than that of the grape pickers and packers in California.

The Texas workers have banded together into an unaffiliated union and are demanding $1.25 an hour. Present pay is between 60 and 85 cents an hour.

And the Texans are receiving encouragement and advice from the experience of the National Farm Workers Association in California and their leader, Cesar Chavez.

On a recent visit to OCAW headquarters in Denver, Chavez asked for support for the Texans by this union and OCAW locals and members in the valley.

Brown, speaking to a state convention of the International Brotherhood of Electrical Workers in San Angelo, told of an order by a county commissioner to use county equipment to spray insecticide on the striking farm workers in an attempt to break up a meeting.

"We are told that the Neighhood Youth Corps boys were ordered by this local official to do it," Brown said. "We intend to ask the federal government to investigate the matter. Certainly, the Department of Labor, which finances the Youth Corps, would want no part in such a Nazi-like deed."

He called for "proper legislation to stop this grievous treatment."

The Texas AFL-CIO has sent food and clothing to the striking workers through the Bishop's Committee for the Spanish-Speaking of the Catholic Church.

Growers are importing strikebreakers and union officials charge that many of them are workers from Mexico. Such action is illegal and Labor Sec. W. Willard Wirtz has been asked to investigate.

Schenley Signs Contract Covering Farm Workers

The National Farm Workers Association, which has been on strike for nine months against California vineyards and captured the nation's imagination with a march from Delano to the State Capitol at Sacramento, has become an established organization with the signing of a union contract with Schenley Industries.

The milestone agreement, providing a minimum pay scale of $1.75 an hour, a union hiring hall, dues checkoff and union shop, was signed in Los Angeles on June 21.

The new contract for farm workers covers some 500 Schenley employes in Delano area vineyards. It is expected to pave the way for decent wages and working conditions for farm labor in California and in other farming centers across the nation.

Bargaining began last April when Schenley agreed to recognize and bargain with NFWA.

William L. Kircher, national organizing director of the AFL-CIO, who played a key role in negotiating the pact, hailed the agreement as a "significant breakthrough and the first contract of its kind anywhere in the farm industry."

Cesar Chavez, director of NFWA, said it was "a milestone agreement" that would have far-reaching effect on the lives of poverty-stricken farm workers.

Sidney Korshak, attorney for Schenley who negotiated the agreement for the company, spiked reports that the immediate 35-cent hourly boost in all wage classifications, as called for in the agreement, would hit the housewife in the pocketbook. The company will absorb the higher production costs out of profits, he said.

 Migrant

IUD Director Cites 'Ferment' For Organizing

There is a "clearly recognizable ferment for new organization" in the country, Jack Conway, executive director of the AFL-CIO Industrial Union Dept., told a press conference in Washington.

Conway said that organizing activities of the IUD, in the last six months, have had "fairly substantial success" and that there is a "shift in the climate in the country as a whole."

He said the "ferment" includes such groups as government workers, teachers, professional workers, medical technicians, migratory workers, and the working poor.

The IUD Executive Board, Conway reported, feels that the current structure of the AFL-CIO may have to be changed to cope with such challenges as organizing social workers, medical technicians, and the working poor.

"I personally believe that the AFL-CIO is equipped to meet this situation which has developed," he said.

Conway noted that the IUD has grown since its convention last November until today it has per capita payments on 6.5 million members. The growth, he added, came from new affiliates, step-up in per capita of older affiliates and new growth.

Federal Protection Urged:

Grape Strikers' Breakthrough Spurs Union Drive on Farms

UNION ORGANIZATION for farm workers is "off the ground," the AFL-CIO's chief organizer has declared in a network radio interview.

William L. Kircher, director of the federation's Dept. of Organization, cited recent union recognition victories of the Delano, Calif., grape strikers as evidence that farm workers can organize and bargain collectively.

In response to questions from reporters on Labor News Conference, Kircher listed three reasons for the improved position for farm worker unionization:

- Killing the bracero law, which permitted the importation of transient farm workers from Mexico.
- The "dramatic appeal . . . developed by the National Farm Workers Association, under the leadership of Cesar Chavez."
- **The seven-year effort of the AFL-CIO's Agricultural Workers Organizing Committee that laid a solid base for the Delano drive and the recognition agreements signed with Schenley Industries Corp. and the Christian Brothers winery.**

Kircher warned that new and wider strikes will be inevitable "as long as the farm worker is excluded from the same kind of federal protection that other workers have—namely, the National Labor Relations Act."

FARM WORKERS are now denied "governmental machinery for indicating their choice or desire with respect to having a collective bargaining process—of organizing themselves into unions of their own choosing," Kircher noted.

Under such conditions, employes have no collective bargaining rights unless their employers voluntarily grant them, he charged, adding that this means strikes, strife and boycotts become "inextricable parts of the procedure."

Reporters questioning him on the weekly AFL-CIO public affairs production for the Mutual radio network were Sam Sharkey of the Newhouse Newspapers and Alan Adams of Business Week magazine.

MEXICAN WORKERS' federation member supports strike of AFL-CIO United Farm Workers Organizing Committee by walking international picket line in Miguel Aleman, Mex., across the Rio Grande River from Roma, Tex. Sign translates into "Strike—Don't Work in Rio Grande." Initials CTM identify the union, affiliated with ORIT—the Inter-American Regional Organization of Workers.

Grower Agrees to Bargain:

Farm Workers Win Beachhead in Texas

Rio Grande City, Tex.—The AFL-CIO's United Farm Workers Organizing Committee won its first beachhead on Texas soil when a major Rio Grande Valley grower signed an agreement recognizing the union as exclusive bargaining agent for his workers.

The grower, Virgilio Guerra of Los Velas ranch near Roma, Tex., agreed to start negotiations promptly on contract terms that will be the first for UFWOC in Texas. The agreement provides that, if no settlement is reached within 60 days, remaining items will be submitted to an arbitrator chosen by union and management negotiators.

The pact was signed by Guerra and UFWOC Vice Pres. Gilbert Padilla in the shade of a large tree in one of the Guerra fields.

Union field workers, immensely heartened by the victory, went back to the picket lines after a lively celebration, determined to win similar settlements with other growers during the present cantaloupe and honeydew melon season, now at its height. The major objective is La Casita ranch, focus of a nationwide "Don't Buy" campaign which UFWOC has asked all American labor to support.

UFWOC achieved its first agreement with the aid of an international picket line, one of the first ever attempted. The Confederation of Mexican Workers (CTM) affiliated with the Inter-american Regional Organization of Workers (ORIT), stationed pickets across the Rio Grande in Ciudad Miguel Aleman, Mex., and hoisted the red and black "Huelga" flag that, under Mexican law, prohibits workers from

(Continued on Page 6)

Mexican Labor Backs Farm Union; Texas Grower Grants Recognition

(Continued from Page 1)

crossing a picket line, or a bridge leading to a work place.

The flags were up from May 11 to May 13, when the governor of Tamaulipas state ordered them down, due to a misunderstanding, the union said. Negotiations are under way to have them hoisted again, UFWOC headquarters here reported.

Not a single Mexican worker crossed into the U.S. while the flags were posted at the Tamaulipas end of the border crossings—at Miguel Aleman, opposite Roma, and Camargo, across from Rio Grande City, the committee staff said.

While the flags were down, 17 workers with green work cards crossed the bridges to work at La Casita, compared with 130 before CTM local and national leaders lent active support to the U.S. strikers.

Now the word is that the growers have turned to the lower valley for new strikebreakers — around Brownsville, McAllen and Harlingen.

Guerra, a grower who employs 50 to 100 pickers, is one of six brothers with extensive land holdings in Starr County and the principal stock interest in this border county's only bank. A family spokesman said the brothers have been "under pressure" from growers and businessmen not to sign the agreement with UFWOC, but Virgilio signed anyway.

Besides strikebreakers, union organizers have had to contend with the Texas Rangers and local politicians who, the workers say, favor the growers.

'Private' Police

When Starr County Atty. Randall Nye called the troopers into this county, the state police met with growers and county officials before starting their tour of duty, UFWOC officials reported.

Since then, they charge, the troopers have "harassed us at every turn" by arresting union pickets—85 at this writing—using boisterous and profane language, jailing UFWOC representatives unnecessarily, and holding one union man —Ismael Dias, driver of a union car—five hours before charging him.

When a train stopped at Mission, Tex., where four women workers were picketing a grade crossing, Rangers removed the crew and took over operation of the train, loaded with melons, the UFWOC reported.

Eugene Nelson of UFWOC was arrested and held on a warrant charging he "threatened the lives" of all Rangers in Starr County. A local constable accused him of coming into the court house and using threatening language. He was held in jail over the weekend before union attorneys obtained his release in bail.

On the other hand, AFL-CIO Organizer David Lopez and the Rev. Ed. Krueger, here as an observer for the Texas Council of Churches, filed charges May 15 that they were "roughed up" by a trooper at the Texas end of the international bridge here. They reported no action from the county attorney as of May 17.

The union sent a telegram to Pres. Johnson charging the Rangers "acting under color of law" are using physical violence and intimidation to deprive citizens of their constitutional rights and urging him to authorize an investigation. The Justice Dept. then sent investigators here.

Metal Trades Name Raftery to Council

Pres. S. Frank Raftery of the Painters has been elected to the executive council of the AFL-CIO Metal Trades Dept. to fill a vacancy.

Russell M. Stephens resigned as third vice president of the department when he left the presidency of the Technical Engineers to accept a government post. Other vice presidents moved up and Raftery was chosen ninth vice president.

SWAFCA

THE SOUTHWEST ALABAMA FARMERS COOPERATIVE ASSOCIATION

SWAFCA is an association of Black Belt Farmers - over 700 members. We are farmers who are tired of growing cotton for nothing and want to grow vegetables, fruit and livestock -- for money. Many of us have already started growing these things.

But we know we must JOIN TOGETHER if we are to survive on the farm. We have started a COOPERATIVE. We call it SWAFCA. It is our business owned by us -- the farmers of Hale, Perry, Greene, Dallas, Wilcox, Monroe, Sumter, Lowndes, Marengo, and Choctaw Counties. Membership is open to all farmers from these counties - ONE MAN ONE VOTE.

SWAFCA IS PEOPLE WORKING TOGETHER TO GET WHAT THEY NEED, WHAT THEY WANT, AND WHAT THEY CAN'T GET WORKING ALL ALONE!

THIS IS HOW SWAFCA WILL WORK:

SWAFCA will help farmers buy as a group. This means buying fertilizer, seed, and insecticides in LARGE amounts at CHEAPER prices.

SWAFCA will help farmers sell as a group. Each member of SWAFCA will agree to grow a certain number of acres of a vegetable, for example, okra, to sell through his cooperative - SWAFCA. The co-op then adds up the acres of okra it has to sell and talks to buyers. When you have 1,500 acres of okra to sell instead of 5 acres - you can talk different.

SWAFCA IS NOT ONLY FARMERS BUYING AND SELLING TOGETHER, IT IS FARMERS WORKING TOGETHER TO GET:

AID IN VEGETABLE GROWING
CLASSES IN COOPERATIVES
MONEY FROM THE POVERTY PROGRAM
MONEY FOR MACHINERY AND PACKING SHEDS
HELP FROM AGENCIES THAT NEVER HELPED BEFORE

SWAFCA IS OVER 1,000 PEOPLE WORKING TOGETHER DOING THINGS ONE MAN CAN'T DO ALONE.

A REPORT ON

THE DELTA FARM STRIKE

BY: CLAUDE RAMSAY, PRESIDENT
MISSISSIPPI AFL-CIO

August 16, 1965

During the past few months the farm strike in the Mississippi Delta has received much publicity in newspapers and magazines throughout the United States. We, in the State AFL-CIO office, have received numerous telephone calls and letters concerning the situation. Appeals for financial assistance to our unions throughout the Nation are continually being made. For these and other reasons I have decided to write this resume of the situation in general.

During the "long hot summer" of 1964, I had two ministers associated with the Delta Ministry call on me at the State AFL-CIO office in Jackson, Mississippi. They wanted to talk about the possibility of organizing the farm laborers in the Delta. Our conversation lasted approximately two hours. During this period of time I reviewed the situation from stem to stern with these people. I advised them that, as I viewed the matter, this situation was impossible to deal with from a trade union point of view. In so doing I reviewed the AFL-CIO's experience in trying to organize the sugar cane laborers in Louisiana and the vegetable growers in California. At the end of our discussion, I introduced them to R. W. Starnes, Assistant Regional Director of Organization for the AFL-CIO, and suggested that they review the situation with him. In essence Bob gave them the same advice as I.

There can be no question about the wages and working conditions of these workers in the Mississippi Delta, they are among the worst existing anywhere in the Nation. Faced with these facts, the question arises as to why the problems of these people can not be solved from a trade union point of view. In order to understand this it is first necessary to know something about the Delta farm operation.

The Mississippi Delta is approximately 150 miles long varying in width up to approximately 75 miles. The area comprises most of the land area in 18 counties. Hundreds of plantations of varying size are in operation, with the major crop being cotton. During the past decade most of the day labor has been eliminated by machinery. As a matter of fact, most of the cotton is now picked

by mechanical pickers; the mule has long since been replaced by the tractor. This means that cotton chopping is the only work of any significance left for the farm laborer except, of course, the machine operators. According to the best information available, approximately three thousand equipment operators are involved and some twenty-five thousand men, women and children who work in the fields during the chopping season. This season usually lasts about two and a half months during the growing season.

Employment is fairly steady for the 3,000 equipment operators since they prepare the soil, plant and cultivate the crop as well as operate the mechanical pickers. The going wage for these operators is $6.00 a day which is from sun-up to sun-down. The choppers receive $3.00 a day, which in most cases is from day light 'til dark. Most of the equipment operators live on the plantations in rent-free tenement shacks scattered throughout the area. On the other hand, most of the choppers live in the towns and communities throughout the Delta and are recruited and shaped up into crews by a local Negro who receives fifty cents per laborer recruited for a day's work.

Obviously, the only organizable people in this operation are the 3,000 equipment operators who live on the plantations. How do you organize and produce benefits for some twenty-five thousand seasonal workers who are employed only two and a half months each year and who are largely unemployable elsewhere? The answer to this question is also obvious, you can't. The other question is, how do you organize 3,000 tractor drivers scattered over this large area who live on the plantations? Again the answer to this question is obvious, it would take an army of organizers to cover the area who in turn would find the task of even meeting the people almost insurmountable. The cost factor would, of course, be prohibitive in such an operation.

All of these things were reviewed with the Reverend Larry Walker and his associate, I can't recall his name. Both of these gentlemen had come to the Delta area as part of the "Summer Project" sponsored by the various Civil Rights groups. It should also be mentioned that these ministers discussed with me their plans to picket Greenville Mills in an effort to secure more employment for Negroes in the plant (Greenville Mills is a carpet manufacturing plant in Greenville and is not organized). Pickets were placed on this plant and kept there for a number of months. I mention the Greenville Mills situation for I am convinced that the Delta farm strike grew out of this situation.

During the month of May of this year, several tractor drivers walked off their jobs at the Andrews plantation in Tribbett demanding an increase in pay. Since that time efforts have been made to keep others off the job in the surrounding area. Considerable publicity has been given to the situation. A number of reporters for various publications have spent considerable time in the area. Estimates vary as to the number of people actually on strike but everyone who has spent time in the area seems to agree that the strike has not been very effective to date. This is understandable when you consider the fact that only three or four plantations are affected out of the hundreds in the area. While not trying to be critical of the people responsible for the situation, this is exactly what I had warned them against.

As already stated, we have received numerous letters and telephone calls for help both from the strikers and unions in the North. After discussing the matter at length with Donald Slaiman, Director of the Civil Rights Department of the AFL-CIO, it was agreed that someone from his department should go in and survey the situation. Consequently one of his assistants, E. T. Kehrer, who works out of the Atlanta office, spent almost a week in the area during the first week of July. Kehrer's report verifies the fact that the lot of these people will be hard to improve from a trade union approach, even though we are very much in sympathy with their plight.

As Kehrer points out in his report, it is almost impossible to separate the Freedom Labor Union project from the various civil rights projects in the area. As a matter of fact, the FLU appears to have been organized by the Freedom Democratic Party - the FDP in turn was a by-product of the 1964 "Summer Project." FDP has been very critical of the State AFL-CIO in its newsletter and has especially been critical of me. This criticism seems based on the fact that we advised them against this course of action in the first place. I also suspect that part of this criticism is based upon ignorance as to what has been done. Some of this criticism is directed at the so-called liberal establishment of which the AFL-CIO is a part and which the FDP seems to hate about as much as any thing else.

Contrary to the belief of some of these people, the State AFL-CIO is very much concerned over the plight of these people and wants to do everything possible to alleviate conditions in this area of the state. In an effort to do this we have spent considerable time and effort on the situation. The criticism seems

to center around the fact that we are in disagreement on the approach and that we are trying to make sure that any money sent into the situation is used in the proper fashion.

A review of certain things indicates that some of the people involved in the problem actually don't have the welfare of the people at heart. For instance on July 22 a young Negro called on me at the office and announced that he was chairman of a committee that had been sent up to raise funds for the strikers. Some time after he had left a person with one of the more responsible civil rights groups called and advised me that he could not be trusted and that he had a reputation of having sticky fingers.

A few days later I was contacted by the Shaw group and agreed to see a committee from that local. This meeting took place in our office on July 26. There were eight people in the group including George Shelton, Chairman of the local, Secretary-Treasurer Thomas Knight and myself represented the Council. This meeting lasted for approximately an hour and a half. In the course of this meeting we reviewed the situation in detail. I suggested that the logical answer to the Delta farm problem would be to extend the Minimum Wage law to cover farm labor and a training program, financed through the Office of Economic Opportunity, for the displaced or seasonal workers. This idea went over like a Ton of Bricks. A young white Snick worker with the group said I did not have the spirit of the labor movement and that these people were going to strike until their demands were met.

Having been advised by Kehrer that there was no semblance of real organization and that no machinery existed to properly disperse funds to the needy, I next suggested that I contact the Organization Department of the AFL-CIO and see if we couldn't get an experienced organizer to come in and help set up a real organization. This too went over like a ton of bricks: I was told in short order that they did not want any one coming in to tell them what to do. They said that all they wanted me to do was to raise money for them. I then pointed out the fact that they were asking me to help finance an independent union not affiliated with the AFL-CIO and that I doubted if any of our unions would be interested in such a proposition. My next suggestion didn't go over either; I told them that I would advise our unions to send contributions to the Delta Ministry for distribution purposes, feeling that this group would be in a better position to see to the needs of the people in the entire are. Their position was the same - All funds should be sent to the Shaw Local.

At the close of the meeting I told the group that I would like to arrange another meeting with them in the near future and invite representatives of the AFL-CIO's Civil Rights Department and the Organizing Department. They agreed to this proposal advising me where to contact them, etc. Consequently, I arranged another meeting in our office on August 10th. As soon as arrangements were completed for the meeting, I called the group and advised them of the date, time and place.

On the morning of the 10th a gentleman by the name of Aaron German called me, collect, from Shaw and wanted to know if the meeting was still on. I advised him that it was and that I had several people coming in for the meeting. He said he did not know if they could get down or not, that George Shelton was in Washington and that they did not know if they could arrange for transportation. I, of course, urged him to make every effort to get here since we had all of these people coming in.

The following were invited and did attend the meeting. E. H. Williams, AFL-CIO Regional Director; Robert Starnes, Assistant Regional Director, AFL-CIO; E. T. Kehrer, AFL-CIO Civil Rights Department; James Jackson, State Director of the Amalgamated Clothing Workers of America; Russell McMahan and Miss Bernice Hinton of the Int'l. Ladies' Garment Workers Union; Thomas Knight, Secretary-Treasurer of the State AFL-CIO and myself. Jackson and McMahan were invited to the meeting because numerous appeals had been made to their two international unions for financial assistance. We wanted them to get a first hand look at the situation. It should be noted that several of these people went to great length to get to this meeting. Williams drove in from New Orleans, about 250 miles; Jackson drove a hundred miles from Hattiesburg; McMahan and Hinton drove two hundred miles from Pascagoula and Kehrer flew in from Atlanta.

The meeting was scheduled for two p.m. at our office. After the above named group had arrived, I advised them of the telephone call earlier and that I doubted if any one from Shaw would show. In view of the fact that we needed to discuss this situation at length with these people, we started the meeting as scheduled. Kehrer and myself went into detail with the group pointing out all of the complications involved. In so doing I pointed out the fact that there appeared to be an element involved which seemed determined to discredit the AFL-CIO and that I wanted to avoid giving them any unnecessary fuel.

We all agreed that conditions were deplorable in the area and that there was an obvious need for help for some of the people. We further agreed that in order to make sure that funds were allocated properly, contributions from our unions should be sent to either the Delta Ministry in Greenville, Mississippi or the State AFL-CIO for distribution. It was the feeling of the group that I should advise our International Unions to this effect and suggest they in turn pass this information on to their local unions.

Our discussion lasted approximately an hour and a half. At the end of this time I placed a call to Shaw to determine if any one was on the way to the meeting. Mr. German answered the phone again and advised me that they had not been able to arrange transportation. I asked him when Shelton would be back; he said they expected him to be gone for at least a month. Apparently Shelton is now touring the North appealing for funds. If this is the case, it is even more important that this report be carefully read.

Everyone in the meeting thought it rather strange that arrangements could be made to send Shelton to Washington for a month, yet transportation could not be arranged for a hundred mile trip to Jackson. As has already been pointed out, many of our people went to great length to get to the meeting and were naturally disappointed when no one showed from Shaw. Frankly I was not too surprised after considering what transpired in our meeting on July 26th.

As of this date we have received no further word from these people. In the event we do, we shall carefully catalogue all developments for future reference. I hope to get into the area myself in the near future for another first hand look at the situation.

AFL-CIO NEWS - Sept 3, 1966

Cracks Into Anti-Union Stronghold

San Francisco—Field workers at two major farms of the giant DiGiorgio Corp. have chosen the AFL-CIO as their collective bargaining representative in a crucial and historic farm labor election.

Unofficial returns indicated that the two unions of farm workers which have been on strike at DiGiorgio since last September and who made up the single AFL-CIO entry on the ballot defeated the Teamsters in a unit of nearly 900 field workers.

Official results of Aug. 30 voting at the firm's Delano and Borrego Springs farms were delayed until arbitrators could rule on 332 challenged ballots.

But observers were convinced that the challenged ballots could not upset the unofficial result. Nor would they change the choice of the Teamsters in a smaller unit made up of truck drivers and helpers and shed workers.

AFL-CIO Pres. George Meany wired the United Farm Workers Organizing Committee, Cesar Chavez and Larry Itliong, its leaders:

"Warmest congratulations on a great victory. The road is now open to a new era for farm workers, not only in California but all across the nation.

"You are the pioneers who opened that road and you will be gratefully remembered for generations by those who will benefit from your efforts.

"But let us now move forward. As you know this triumph is not an end in itself but only a beginning. I again assure you that

(Continued on Page 3)

(Continued from Page 1)

the whole AFL-CIO will be enlisted in the battles ahead, as it was in the battle just won."

Sources close to the election reported that the AFL-CIO unit received 528 votes, the Teamsters 328, no union 12 votes in the "white ballot" unit made up of field workers. The vote in the other, smaller unit was 94 for the Teamsters, 43 for the AFL-CIO, seven for no union.

Final Tally Delayed

Arbitrators Sam Kagel and Ronald Haughton announced Aug. 30, that there would be no final count of the 1,349 ballot cast until 332 challenged votes had been decided.

By far the greatest number was held up on claims that the voter's name did not appear on the list of workers who had worked at least 15 days for DiGiorgio since the start of the grape strike.

To rule on whether the challenged votes would be counted, Kagel said, would take at least two days, perhaps as much as a week. Pending that determination, no official count would be announced, he said. The two arbitrators were to start hearings on them Sept. 2.

The arbitrators' announcement was given to a score and more reporters, television and still cameras, reflecting some part of the national attention that has been focused on the fight of the Delano grape strikers for union recognition and collective bargaining.

AFL-CIO Dir. of Organization William L. Kircher, who headed the election campaign, said in Delano:

"The DiGiorgio victory has a message for every farm worker in America—it can be done. Farm workers can unionize, they can use collective bargaining as a base for building a better life and a greater share of America's abundance for themselves and their families, even when powerful forces enter into a conspiracy to defeat them.

"What hapened in Delano has a message for every AFL-CIO member also. It is a timely reminder that the unity and solidarity of all union workers still provides the best pavement for the road to a better way of life for those who have long been denied."

The crucial, pathfinding vote hac few precedents in farm labor his

tory and none of the legal procedures that surround the usual National Labor Relations Board representation elections.

It involved, too, one of the state's largest and most influential farm corporations, as well as a head-on contest between the AFL-CIO and the Teamsters, the latter a late entry in the effort to win bargaining rights for DiGiorgio farm workers.

And it climaxed, just days short of a year, the strike by grape pickers in the National Farm Workers Association and the AFL-CIO Agricultural Workers Organizing Committee.

It was Sept. 8, 1965, that AWOC launched its strike in the Delano vineyards, joined days later by the NFWA. They fought side by side through a long winter, but with growing support from the labor movement and from a variety of church and civil rights groups.

The grape strikers capped a 300-mile march from Delano to the state capitol at Sacramento last Easter with the announcement that their strike had won union recognition at the Schenley vineyards, second largest of the Delano growers.

The way was opened, too, for negotiations with DiGiorgio that ultimately led to last Tuesday's vote.

Election Last June

The corporation had conducted an election of its own last June. That was set aside after AWOC, NFWA and others protested the almost total absence of impartiality. The Teamsters had been the nominal "victor" in the company-sponsored ballot.

Gov. Edmund G. Brown appointed Haughton, head of the University of Michigan Institute of Industrial Labor Relations, as fact-finder in the disputed vote.

Without passing judgment on the DiGiorgio-sponsored vote, Haughton won agreement of all parties to an election on Aug. 30 conducted under jointly-agreed rules by the American Arbitration Association. Haughton and Kagel, a University of California law professor, would stand by to decide disputes.

The rules for the new election met the principal objections of the two unions of grape strikers who joined forces in the election: they recognized the right of strikers to vote and they insured impartial conduct of the balloting. Both safeguards had been ignored by DiGiorgio in its balloting.

DiGiorgio had been the target of a long, bitter, and unsuccesful strike nearly 20 years ago. With that exception the Delano grape strike was the first significant union activity in California's vast corporate agriculture since the Thirties.

Victory at DiGiorgio marks a major milestone not only for the year-old grape pickers' strike but for the state's—and the nation's—farm workers.

Kircher said that in the final weeks of the campaign representatives of AFL-CIO unions came to Delano to help in the campaign. Five special representatives of the national AFL-CIO staff were there for the last five weeks of the campaign, he added.

Migrant Labor

RESOLUTIONS

WHEREAS, the condition of the more than 100,000 Farm Workers in South Florida is morally, economically, physically and socially intolerable, exhibiting the following characteristics:

a) The average annual wage of the Florida Farm Worker is less than $900 - not even one-third that of the national poverty level.

b) The health condition of the Farm Workers continue to exhibit high rates of disease and sickness incomprehensible in Modern 20th Century America. For example, in one of Florida's smallest counties 100% of all Migrant children between the ages of 0 and 15 years have parasitic diseases, 43% of these also have skin diseases and 86% of them under 5 years of age suffer from diarrhea.

c) Studies demonstrate the pathetic state of education among the Farm Workers where the average adult has an educational level of less than 6 years. Less than 1% of Farm Workers finish high school, and it is the rare individual who has ever entered college.

d) Housing conditions are in such a deplorable state that "new" 1966 farm family housing is an 8 x 16 ft. wooden shack without electricity or toilet facilities and other housing is inadequate, dirty, unsafe, and expensive. In Collier County alone last year fires destroyed 175 beds

in 7 camps with 4 deaths and the destruction of 13 buildings;

e) A Farm Worker's infant's chances to live and enjoy life are significantly less than those of his urban counterpart. In one area over one third of the Migrant births reported were delivered by midwives outside of hospitals and without a physician present;

f) Sanitation conditions are so basically deplorable that privies are almost totally lacking in the fields and drinking water is contaminated by sewage. In the Florida Health Projects Report one county was reported as stating that there were more health violations than privies;

g) The morals of the Farm Worker and his family are daily undermined by the almost total lack of privacy in their housing and toilet facilities;

h) Social Security laws; Child Labor laws, School Attendance laws, and other protective laws of the State are often unenforced with reference to the Farm Workers;

i) Unemployment insurance coverage, unemployment disability insurance coverage, workmen's compensation, fair employment coverage, and Social Security coverage are either nonexistent or inadequate;

j) Economic exploitation in the form of "company stores" and exhorbitant interest rates is the pattern among the Farm Workers;

k) Mothers with young infants and young school children are

forced to work to subsist while their infants are either left on their own or cared for by school-age children;

WHEREAS, the local communities, often oblivious to the plight of the Farm Worker, manifest their "cruel concern" for the Farm Worker by

a) "Imprisoning" the Farm Worker in the camps and other types of ghettoes;

b) Generally denying the Farm Worker the protective function of the law;

c) Effecting in the communities' economic and moral life the grower's adage of "We used to buy our slaves. Now we just rent them."

d) Disavowing the plight of the Farm Worker in the hospitals, doctors offices, and clinics as exemplified in instances where doctors refuse to treat Farm Workers even when offered adequate remuneration, and hospitals refuse to admit them;

e) Refusing to implement Federal ameliorative programs geared to uplift the Farm Worker;

WHEREAS, the State of Florida has portrayed an image of total unconcern with the plight of the Farm Worker on a State level by:

a) Being remiss in the enforcement of housing codes, sanitation laws, compulsory school attendance laws, automobile safety inspection laws;

b) Allowing camps once closed for health reasons to reopen

with identical unsanitary and unhealthy conditions;

c) Failing to enact basic programs to correct the existing conditions spelled out above;

d) Not cooperating in the development of imaginative approaches in education, housing, community development, manpower training, and others to restore dignity and self actualization to a people exploited by and forgotten in the State of Florida.

WHEREAS, the Nation's conscience, characterized principally by total apathy and only recently pricked by such events as the Edward R. Murrow documentary "Harvest of Shame", the hearings by Senator Williams' Committee, and the recent marches in Delano and Texas, has responded with token measures which either inadequately or not at all address such major existing problems as:

a) The lack of Unemployment Compensation Benefits to Farm Workers;

b) The lack of total coverage of all Farm Workers by the Minimum Wage Law;

c) The lack of the safeguards of the National Labor Relations Board;

d) The lack of proper legislation regarding national housing codes, minimum national health standards, proper safety codes, standardized sanitation laws, and national crew-leader registration laws;

e) The lack of national welfare laws applying to all the poor;

f) The inadequate Federal Programs and Money to attack the problems of the Farm Worker in a massive, imaginative, and planned manner;

g) The rigid Federal Loan Programs which eliminate the vast majority of Farm Workers from their benefits;

h) The lack of a Legal Aid Program designed to actively seek the rectification of all inequities wrought upon the often unsuspecting and uninformed Farm Worker;

i) The lack of a Nation's and Federal Government's enthusiastic commitment to erase a stain of such magnitude that it calls out unceasingly for remedy in a Nation built on the principles of Freedom, Justice, Equality, and Humanity.

WHEREAS, the Diocese of Miami Human Relations Board, The Florida Migrant Ministry, The American Friends Service Committee, The Florida Chapter of NAACP, the Community Action Fund, The Inter-Faith Agency for Social Justice and Farm Workers throughout Florida, meeting on October 28, 1966, at Sts. Peter and Paul Church, realize that the above conditions are true and that these conditions can only unite men of good will everywhere in calling out for their remedy,

THEREFORE, BE IT RESOLVED:

That a resolution be sent to all International Union Presidents calling upon them to:

a) Reassume the humanitarian concern which was once theirs and to accept the responsibility which is theirs by virtue of their office and the labor tradition to organize the

unorganized Farm Work in order that he may attain the economic benefits which are his due as a human being and as a laboring man;

b) Seek union contracts incorporating the following:

1. Increased hourly wages;
2. Improved incentive rates;
3. Guaranteed minimum daily wage (when work is available);
4. Show-up pay (when worker reports to work and work is not available);
5. Life, hospitalization and medical insurance for employee and dependents;
6. Transportation allowance;
7. Standards for sanitation, health and safety;
8. Mandatory direct payment from grower to worker (eliminates crew leader as paymaster).
9. Mandatory Social Security deductions;
10. Workmen's Compensation coverage;
11. Housing or housing allwance at workers option;
12. Access to property by non-workers;
13. Grievance procedure and arbitration;
14. Other fringe benefits normally incorporated in union contracts;

c) Join with the above mentioned Churches, Service Groups, Organizations, Community and Grass-Roots leaders in alleviating the above stated conditions of the poor through such wide-range corrective programs as:

1. Cooperative self-help housing
2. Cooperative stores
3. Credit unions
4. Medical and dental clinics
5. Legal care centers
6. Day care centers
7. Recreational centers
8. A full worker education-vocational training program incorporating:
   a. Youth Education Centers
   b. Adult Education Centers
   c. Neighborhood Youth Corps
   d. Opportunities Industrialization Centers
   e. On-the-Job Training
   f. Training through the Office of Manpower and Training (OMAT).

9. A comprehensive mobility program to provide resettlement after training.

d) Join with the above mentioned groups in securing local, State, and Federal Legislation in the following areas:

1. Coverage under the National Labor Relations Act
2. Extension of the Fair-Labor Standards Act
3. Mandatory coverage under Workmen's Compensation Act
4. Coverage under Unemployment Compensation Laws
5. Federal Minimum Standards on Housing, Sanitation, Health and Safety
6. Enforced and strengthened crew leader registration laws
7. More and better programs through Federal Agencies.

AND BE IT FURTHER RESOLVED

(1) That a delegation be sent to the Governor-elect on the night of his election calling for his commitment to a State program incorporating the following:

a) An assistant to the Governor, or a State Cabinet Office of Farm Worker Coordination, or a State Commission to be appointed by the Governor to address itself entirely to the affairs of the Farm Workers;

b) A State Minimum Wage Law to encompass all the workers;

c) Coverage of the Farm Worker under State Workmen's Compensation and Unemployment Compensation Laws;

d) Effective and enforced laws and programs regarding health, safety, housing, and sanitation;

e) Enforcement of compulsory school attendance laws among the Farm Workers;

f) A State Crew-Leader Registration Law;

g) New and dynamic programs to upgrade the educational achievement of the Farm Worker;

h) A concerted program to bring into Florida massive Federal Programs and Money such as Poverty Funds, Manpower Training, Education, etc., so that the Farm Worker may take his place in American society as a productive and responsible member;

i) A visit by the Governor-elect to the farm labor camps to see at first hand this State and national disgrace.

(2) That a delegation of the above mentioned groups meet with the Florida Senators and Congressmen to alert them to the gravity of the conditions mentioned above, to make them aware of the combined concern of said groups, and to secure from them a commitment to unite in securing the following legislative program:

a) Coverage under the National Labor Relations Act.

b) Extension of the Fair-Labor Standards Act.

c) Mandatory Coverage under Workmen's Compensation Laws.

d) Coverage under Unemployment Compensation Laws.

e) Federal Minimum Standards on Housing, Sanitation, Health, and Safety.

f) Enforced and strengthened Crew Leader Registration Laws.

g) More and better programs through Federal Agencies.

h) More imaginative and adaptive programs and policies and increased appropriations in the following Federal Programs as they particularly relate to the Farm Worker:

1. The OEO
2. Farm Housing Act
3. Manpower Development and Training Act
4. Elementary and Secondary Education Act
5. Higher Education Act.

(3) That a resolution be sent to Presidnet Johnson and to the Nation incorporating the following:

a) The Farm Worker has been subsidizing the Nation through his back-breaking, undercompensated and inhumanitarian labor.

b) The Nation can not permit this disgraceful condition to remain as a symbol of apathy, exploitation, and evil.

c) The plight of the Farm Worker cries out to our Nation's conscience for immediate and effective help.

Migrant Labor

Selected Readings

Migratory Workers

The living conditions of migratory workers seem to have hardly changed at all since the earliest days when the "Okies" sought to pick fruit in California. They are a reality within the realm of our American society, but they live outside its structure; so much so, that until recently, when government and academic studies began to focus on these problems and publish a good deal of information about them, the major portion of the American population had been almost totally unaware that people were living in such despicable conditions in this day of progress, affluence, and comfort.

Poverty, community ignorance, and indifference maintain a vicious cycle which prevents change or escape, and so it has continued, generation after generation.

Over 10,000 domestic (mostly Texas Mexican) migratory workers come to Wisconsin annually with their families to work primarily in agriculture. The University of Wisconsin takes an active part in the study of their conditions and needs, under the direction of Professor Elizabeth Brandeis, in hope of being able to instigate improvements. (See "Migratory Workers" in the "News" section for details on her project.)

The library of the Center for Studies in Vocational and Technical Education is gathering material on various aspects of this field, including information on the migrant worker. It is hoped that a recognition of existing conditions can lead to action in the way of making available education and vocational training so that the cycle can be broken, and those who desire to improve their lot will have the means to do so.

The following publications are included in our collection to date:

AGENDA, Vol. I, No. 4 (MAY, 1965)
Several articles in the Industrial Union Department publication are devoted to the problem of the migrant worker. As a preface, the "Legislative Newsletter" summarizes the most recent legislative activity in relation to migratory farm labor.

"The Forgottenest" discusses the problem of braceros and the resulting grower attacks on Secretary Wirtz, the major migratory routes, uninsured occupational hazards, and needed legislative action.

"Human Loss Beyond Comprehension" is a statement on the nation's apathy by W. Willard Wirtz, Secretary of Labor. This was the result of a trip on which he visited the migrant farm workers.

Some "Facts and Figures" on the size of farms, child labor, union activity, and sharecroppers give a summary view of the current situation.

James F. Patton, President of the National Farmers Union, wrote "The Vanishing Family Farm" and shows its diminishing position in the face of the big food industry so that "if present trends continue the result will be complete elimination of competition in the market place and a reduction of farmers to sharecroppers or farm workers who have lost all control over farm management." The action proposed and accomplished by the National Farmers Union since 1949 is indicated as well.

The "Economy Newsletter" ends the series of articles specifically on migrant labor. This includes information on wage-price relationships in agriculture.

BRANDEIS, ELIZABETH. "MIGRANT LABOR IN WISCONSIN." *LABOR MANAGEMENT AND SOCIAL POLICY: ESSAYS IN THE JOHN R. COMMONS TRADITION,* CH. VIII. MADISON, 1963, pp. 197-230.
Miss Brandeis' essay sketches the over-all situation of migratory labor in this country, and that of this state is given in detail. She begins with an historical survey of the use of migrant workers in Wisconsin, describing the original use of recent immigrants, the Mexicans and Texas-Mexicans, and finally children. The farm labor shortage during World War I began the steadily increased large-scale use of migratory workers. Today's conditions (particularly for the dark-skinned Spanish-speaking workers), wages, current national concern, government protection (both state and federal)—all these aspects are discussed, and she concludes that most protective legislation wholly or partially excludes agricultural workers. The Fair Labor Standards Act exempts them wholly from wage and hour provisions and largely from child labor laws. The Social Security old age, survivors, and disability insurance, the 1937 Sugar Act, the Interstate Commerce Commission's rules for transportation and the 1959 regulations for growers all meet with such difficulties that they are rendered weak and ineffective.

The State of Wisconsin ranks high in providing legislation, but there still lacks protection for minimum age, limits of hours, child labor, unemployment compensation, assistance in case of sickness or other misfortune (because of residence requirements) and decent housing. Only in 1961 was workmen's compensation initiated. In comparison to the domestic work force, foreign workers entering the country from Puerto Rico and under agreements with Mexico and the British West Indies have more protection.

Miss Brandeis tries to answer the question, "Why do migrants benefit so little from labor's gains?" and explains some of the difficulties involved, such as

the unstructured and unorganized relationship between worker and employer.

In conclusion, she writes, ". . . if most of these stoop labor jobs do disappear in the next few decades, they will leave behind an ugly residue of children grown into adults with so little education that they will be unable to function in the modern economy."

CHILDREN IN AGRICULTURE UNDER FEDERAL LAW. U.S. DEPARTMENT OF LABOR, WAGE, HOUR AND PUBLIC CONTRACTS DIVISION. 1964, 1 PAGE.

This is a table of figures covering the period of July 1, 1963 to July 30, 1964, which correlates school grade retardation and the illegal employment of children.

DANIEL, FRANZ. "PROBLEMS OF UNION ORGANIZATION FOR MIGRATORY WORKERS." *INDUSTRIAL RELATIONS RESEARCH ASSOCIATION PROCEEDINGS.* MAY, 1961, pp. 636-643.

"The problem of organizing working people into unions consists of an educational procedure which convinces those people that they will economically benefit by organization." It is difficult to work against the fear, resentment, and lack of confidence of the worker, but the AFL-CIO has made a great deal of progress nevertheless. The author describes some of the activities, the goals, and the successes of unions in the face of many obstacles, among them that of resisting growers who discourage domestic help, and seek out the more docile, lower-waged braceros.

FARRELL, A.E. *END CHILD LABOR NOW!* GOOD HOUSEKEEPING MAGAZINE (NOVEMBER, 1960) pp. 62-66.

This article is designed to open the eyes of that section of the public which is ignorant of the existence of such a group as migratory workers, and their conditions of living. Farrell concludes with recommendations for action both legislative and on the community level.

FOCUS, AN OCCASIONAL NEWSLETTER ON THE EDUCATION OF MIGRANT CHILDREN. MAY, 1964, 4 pp.

Different topics discussed here include the implications of the Economic Opportunity Act for migrant workers, the highlights of the Poverty Program (an emphasis on youth, community action, programs for rural areas, and the volunteers' program), the "Areas of Need," such as day-care centers, preschool care, language training, and adult education. In this issue are suggestions for action and selected readings for the interested citizen.

LEVINE, LOUIS. "A MIGRATORY WORKER IN THE FARM ECONOMY." *INDUSTRIAL RELATIONS RESEARCH ASSOCIATION PROCEEDINGS.* MAY, 1961. pp. 622-630.

The author compares the characteristics of hired farm workers to those of workers in other industries. They show a looser attachment to the labor force, more casual relationships with the employer, and they have not unionized because of conditions and a lack of legislative protection. This, however, is currently changing. The labor surplus situation is aggravated by three basic factors: technological displacement, chronically low incomes on the less productive farms, and the high increase in rural population.

Several aspects of the problem include: the role of the employment bureau in maximizing a continuity of employment, the origins and travel-ways of the different types and regional groups of migrant workers, and the earnings of migrant workers which vary from crop to crop, area to area.

The migrants' bargaining position is a difficult one in relation to the availability of foreign workers and new farm machinery. As unemployment is increased these people are in no position, educationally, to seek out non-agricultural work.

Levine feels that while the humanitarian and welfare aspects of the problem are very important, the more fundamental areas in need of attention are employment and the labor market.

THE MIGRATORY FARM LABOR PROBLEM IN THE UNITED STATES. 1965 REPORT OF THE COMMITTEE ON LABOR AND PUBLIC WELFARE. UNITED STATES SENATE, SUBCOMMITTEE ON MIGRATORY LABOR. WASHINGTON, 1965. 76 pp.

After a statement of the Senate resolution and some brief background facts, the report thoroughly examines most aspects of the migratory problem.

Two major sections deal with legislative accomplishments and continuing needs in the areas of health, education, day-care for children, sanitation, housing, contractor registration, and foreign workers; and in the second, those problems calling for basic legislation such as wages, unemployment and underemployment, collective bargaining, child labor, compensation, insurance, transportation, and residence requirements.

Three appendices offer vital information on this subject. The first deals with helping factors—the Economic Opportunity Act, the provisions of which are enumerated, and facts about VISTA volunteers. In the second the problem of foreign labor is examined. The text of Secretary Wirtz' statement on the termination of Public Law 78, regulations governing temporary, foreign agricultural workers, and the agreement concerning the employment of British West Indians for agricultural work are all included. The last appendix gives the text of selected laws affecting migratory labor. These are the Migrant Health Act, the 1964 Economic Opportunity Act, Housing Act, and Crew Leader Registration Act.

THE NATIONAL COMMITTEE ON THE EDUCATION OF MIGRANT CHILDREN has published several monographs (1964). Among these are:

About the National Committee on the Education of

Migrant Children. A brief history of agencies devoted to "America's most disadvantaged" children whose position has, in fact, become worse with the changes in employment needs. The functions of the committee are described and its clearing house is a source of most of the information available on the subject.
Congressional Record, 88th Congress. Ryan, "The Forgotten People." This is a speech encouraging legislative action in behalf of migratory workers with information obtained from reports of the National Committee for the Education of Migrant Children. The speaker stresses the ignorance and/or indifference of states towards the presence of the migrant child within its educational boundaries.
The Educational Problems of the Migrant Child. Education is made almost unattainable to the migrant child because of impermanence, poverty (and therefore unwilling parents), and the public schools themselves, which would rather avoid the difficulties of transient records and the possible retarding influence in the classroom. The article briefly summarizes attempts on the part of the government and national committee to improve this situation.
Status of the Migrant Labor Legislation. A listing (without much description) of bills passed since 1962 regarding child labor, working rates and conditions, taxes, voting, education, health and sanitation services, housing, etc.
Stockburger, *Criteria for the Employment of Foreign Agricultural Workers in the United States.* The author opposes the importation of foreign labor because it worsens the position of "already poverty-stricken domestic migrant labor." For decades they have been denied protective legislation, while the demand for their labor has steadily declined. Evidently farm workers do not share the recent prosperity and declined unemployment found in other kinds of labor, and therefore efforts should concentrate on the improvement of this condition as the domestic force is sufficient to meet labor requirements without foreign importation.
——, *A Statement to the Senate Subcommittee on Migratory Labor.* Miss Stockburger briefly discusses some of the problems of the migrant child's life as seen by workers at a day-care center. While applauding the education bill recently passed, the author maintains that it is incomplete without further provisions for specialized teacher training.
Who is the Migrant Child? His position is outside the structure of community and society, a result of the economic obsolescence and the debasement of the former class of "hired hands." Inadequate diets and unsanitary conditions impair physical development, and in many states the migrant is ineligible for health and welfare services. The greatest area of neglect is that of education.
Woodbury, *In Support of Legislation Concerning Problems of Migratory Workers.* Mildred Fairchild Woodbury, Chairman, at public hearings supports the bills which propose to provide money for day-care centers, educational facilities, and provisions to specially train teachers. Restrictions will be placed on the labor of young children by S.523, particularly necessary as migrancy limits the effectiveness of state action. A sanitation assistance program will be inaugurated.

THE NATIONAL COMMITTEE FOR THE EDUCATION OF MIGRANT CHILDREN offers the following items free upon request:

* *A Survey Interpreted*
* *Fact Sheets*
* *A Selected Bibliography*

Write to 145 East 32nd Street, New York, New York, 10016

SUTTON, ELIZABETH. *KNOWING AND TEACHING THE MIGRANT CHILD.* DEPARTMENT OF RURAL EDUCATION, NATIONAL EDUCATION ASSOCIATION. 1962. 147 pp.

Better educational methods in dealing with the migrant child demand an understanding of the life he leads, his needs, and his deprivations. The author gives a summary description of this background and devotes the remainder of the work to the classroom situation. Her suggestions for improving the educational status of these children are based on their experiences and the resulting insecurities which are aggravated in the non-migrant environment. A good bibliography of selected references is included.

WILLIAMS, HARRISON A. "PROPOSED LEGISLATION FOR MIGRATORY WORKERS." *INDUSTRIAL RELATIONS RESEARCH ASSOCIATION PROCEEDINGS OF THE 1961 SPRING MEETING.* (MAY, 1961) pp. 630-636.

Williams emphasizes that there exists a bipartisan demand for action on the migratory problems. As a result his eleven-point legislative program, along with companion bills, has been introduced. He describes the provisions and methods of bills regarding the following problems: child labor, crew leader registration, National Citizen's Council, education for children of migratory workers, Adult Education Program, health grants for migratory worker families, day-care facilities, housing, minimum wage, National Labor Relations coverage, and domestic worker stabilization.

Consideration is presently being given to problems of unemployment compensation, workmen's compensation, and residence requirements in social legislation.

Migrant Workers in Western Europe.

Literature on the migrant worker in *Western Europe* is also available at the Center for Studies in Vocational and Technical Education. One can see quickly that the conditions and problems associ-

ated with "Migrant Workers" in America are considerably different in Europe—as are the approaches towards solving them.

Whereas research in this country is primarily concerned with deplorable, unsanitary living conditions, the rejection of the workers from the social, educational, and economic community, unequal pay and benefit allowances, etc., the European concern is primarily with the worker's ability to adjust and adapt himself to the new society, the new language. He is often separated from his family and this may create social difficulties, but the term "migrant" truly does carry a different connotation. To begin with, it does not refer only to agricultural labor, and secondly, migrant workers usually have come to work in the host country for some period of time, if not permanently. They may begin a new job with a year contract. In any case, it is not a life of continual living on the road with occasional stops, sometimes as brief as twenty days.

THE ADAPTATION OF FOREIGN WORKERS TO A NEW SOCIAL ENVIRONMENT. ORGANIZATION FOR ECONOMIC COOPERATION AND DEVELOPMENT. PARIS, 1964, 20 pp.

This report was compiled by the Swedish joint team which visited the Federal Republic of Germany from 24th-30th May, 1964. A clear picture is given of European attitudes toward foreign labor, the information and preparation for the move to another culture which is available to migrants, training (language, vocational, and other) which is easily obtained, and housing facilities. Social questions are raised concerning medical care, marriage, adaptation, benefits, religion, and the effects of Communist or Fascist propaganda.

The information contained in this report primarily deals with conditions, problems, and solutions in Germany, rather than in Western Europe as a whole. The variations between countries are too great to assume that similar answers elsewhere could be an accurate representation.

WITHIN THY GATES. A REPORT OF THE CONFERENCE ON MIGRANT WORKERS IN WESTERN EUROPE. ARNOLDSHAIN, 1963. 94 pp.

The proceedings of the Arnoldshain Conference indicate "an important step in the study and action of the member churches of the World Council of Churches on the question of migrations and migrant people." There is a growing number of migrant workers in Western Europe as a result of the "second industrial revolution," and this report deals with the major problems involved including migrant family problems, the impact of the churches, and of the churches on the migrants, the problems of change, and others.

The European migrant's problems are not very similar to those of his American counterpart, and the different nations deal with them differently. Germany shows an active concern and handles the problems well, while in Spain conditions are such that many of her workers are emigrating.

The report concludes with a statement of the churches' recommendations, a guide of discussion questions for local groups, and a selected bibliography, both on Western Europe and individual countries on the continent.

New I.R.R.I. Publications

The following are summaries of a few of the most recently published reprints of the I.R.R.I. A more complete list of 1965 publications can be found on page 11.

Unions and Manpower

BARBASH, JACK. "THE LABOR MOVEMENT IN THE CHANGING INDUSTRIAL ORDER." *LABOR-MANAGEMENT RELATIONS: THE FORENSIC QUARTERLY,"* VOL. 39 (MAY 1965) pp. 19-112.

"This paper aims to examine: (I) the major elements of the present union situation, (II) the quality of the union performance up to now, (III) the factors making for change in the current situation, and (IV) some urgent problem areas."

KASSALOW, EVERETT M. "THE DEVELOPMENT OF WESTERN LABOR MOVEMENTS: SOME COMPARATIVE CONSIDERATIONS." *LABOR READINGS ON MAJOR ISSUES.* (R. A. LESTER, ed.) PRINCETON, 1965.

A basic fact responsible for many of the differences between European and American labor movements is that, as the latter was not built on a previously existing system of feudalism, there are no class or educational divisions. The movement here is narrower than those in Europe, but because it lacks their ideological commitment (usually to Marxism or, as in England, to religious views), American unions are forced to resort to various forms of union security.

The author discusses the main forms and programs employed by European working class movements, the differences in attitudes, conditions, benefits, and government control, and observes that deep socialist feeling and revolutionary ardor has been lessened by improved living standards and welfare benefits. Marxism was being replaced by Reformism.

PETERSON, RICHARD B. "REPRESENTATION ELECTIONS UNDER THE RAILWAY LABOR ACT II." *LABOR LAW JOURNAL* 16:1 (January, 1965).

This article deals with "the form of ballot used in elections under the Railway Labor Act" and is a study of the dispute between the National Labor Relations Board, which recognizes the right of employees to vote against union representation, and the National Mediation Board, which maintains that employees may be given the choice of which union is to represent them, and ask whether or not they ought to be represented.

Peterson first outlines the history of election procedures under the NLRB and NMB, describes the current dispute, analyzes the positions of both parties, and raises several questions for public policy consideration of this issue.

SOMERS, GERALD G. AND ERNST STROMSDORFER. *A BENEFIT COST ANALYSIS OF MANPOWER TRAINING.* MEETING OF THE AMERICAN ECONOMIC ASSOCIATION-INDUSTRIAL RELATIONS RESEARCH ASSOCIATION. IRRA PROCEEDINGS, CHICAGO, DECEMBER, 1964.

This article stresses questions familiar to the economist: how do the gains in earnings and employment relate to the costs of retraining? How do trainees fare in comparison with non-trainees? How long does it take to recoup the costs of retraining? What are the returns on the investment?

The data was obtained primarily from surveys of trainees and non-trainees in West Virginia. The five groups interviewed in 1962, 1963, and 1964 were (a) those who took courses set up for training the unemployed under West Virginia state legislation, (b) disputes from these courses, (c) those who did not report for training after having been accepted, (d) rejects whose applications were not accepted, and (e) non-trainees. This last was the basic control group.

STERN, JAMES L. AND DAVID B. JOHNSON. *BLUE TO WHITE COLLAR JOB MOBILITY.* PROCEEDINGS OF THE SOCIAL STATISTICS SECTION OF THE AMERICAN STATISTICAL ASSOCIATION, CHICAGO, 1965.

This article is concerned not only with how many workers made job shifts, but in which direction the shifts took place, from which occupations, and the process by which the shift might be accomplished. The study aims to determine the kinds of training or retraining programs and policies that might be instituted to facilitate shifts by other blue-collar workers.

Most of the data was obtained from the Milwaukee area, in which preliminary results show that slightly more than one-fifth of the men hired or promoted into white-collar jobs in 1961 and 1962 came from blue-collar backgrounds.

"The emphasis being given to mobility research does not necessarily imply that all immobility is undesirable . . . job stability increases as the worker matures, and the finding of the study suggests that training an older worker may be as profitable to the employer as training a younger worker."

Vocational Education

SAMSON, HARLAND E. "APPRAISAL OF DISTRIBUTIVE EDUCATION TEACHER-COORDINATOR," *DELTA PI EPSILON JOURNAL* 7:13 (November 1964).

This study determined the critical requirements for the performance of secondary school distributive education teacher-coordinators as revealed by an analysis of critical incidents. The resulting critical behaviors were classified into six areas of distributive education teacher-coordinator responsibility. They are: student discipline and control, direction of club program and projects, administration and operation of the program, instructional activities, coordination, and personal and professional relationships. Within these categories, requirements for effective or ineffective performances of teacher-coordinator activities were developed.

Graduate Work

Some of the graduate students in the Departments of Education and Industrial Relations have been doing research relating to studies of vocational and technical education. A list of current and recent studies follows:

1965—Robert Fenske. Education. "The Effects of Local Opportunities for Post High School Education Upon Plans of High School Graduates."

—Brian Heath. Education. "The Prediction of Occupational Status for Non-College High School Graduates."

—Gerald R. Matteson. Agriculture. "The Relationship Between the Vocational Education received by a Randomly Selected Sample of 1960-1961 Male Graduates from certain northeast Wisconsin high schools and Employment Variables" (to be completed by February, 1966).

—G. Soundara Rajan. Industrial Relations. "Apprenticeship in the State of Wisconsin."

1964—Conchita Jimenez. Industrial Relations. (Masters thesis) "An Evaluation of Teaching Machines on Foreign Students."

—Marvin Levine. Industrial Relations. "A Description and Evaluation of Retraining Programs in the United States." (Also 1959 Masters thesis on the "Relationship of Higher Education to Occupational Choice.")

AFL-CIO 3/4/67 Farm Labor

'Courageous Struggle' Hailed:

Solid Backing Given Farm Union's Drive

Bal Harbour, Fla.—The AFL-CIO pledged its "utmost backing" to the task of building a strong farm worker union—"the crucial element in bringing first class citizenship to farm workers."

It expressed its determination also to back up the union drive with efforts to provide through legislation the rights and benefits enjoyed by other workers under federal and state laws.

The Executive Council adopted a pair of statements emphasizing these approaches and singling out the "courageous struggle" of farm workers to create their own union. They are proving, the council said, "as others proved before them—that workers want and need to organize in order to win a fair share of the fruits of an abundant land they helped to create."

The AFL-CIO, the council said, "has had a constant and active program of organization among farm workers," and the newest phase, the creation of the United Farm Workers Organizing Committee, is but another step down the road to building a strong union.

Reviewing the history of farm worker struggles in the past two years, the council noted that the emphasis has been on training and development of farm workers to provide the leadership for the union, for the AFL-CIO believes that the most effective union "will be that which is built by farm workers."

The statement stressed that the absence of legal procedure and protection makes the road the farm worker must travel in building his union "one of strike, boycott and harassment." They have proven, the council added, that the difficulties in California and Texas will not dissuade them from building a great union that will take its place "in the family of organized labor."

On the legislative front, while significant gains were made last year, the farm workers are still "the most exploited group in the American labor force," the council said.

It cited the gain of including 30 percent of farm workers under the protection of the wage-hour law and declared that this protection must be extended to all farm workers.

Their exclusion from the protections of the National Labor Relations Act must be ended, they must be included under all unemployment compensation laws and workmen's compensation statutes, and all foreign labor import programs must be finally terminated.

"The substandard status suffered by the three million Americans who work for wages in agriculture can no longer be tolerated," the council declared.

September 21, 1967

Mr. Bill Channel
American Friends Service Committee
4482 Clinton Blvd.
Lakeworth, Fla. 33460

Dear Bill:

Thanks so much for your memorandum on the current status of union organizing with migrant workers in Florida. I would not expect either Tommy Martin or Mike Lozoff to return to the city. As I understand it, Tommy is already in Arknasas and Mike has other things he feels he should do.

However, there are more pieces to the story than you or I have. One person who could be helpful in putting it together is Vera Rony who is in Atlanta and has been close to the two younger men, Pierce and Helstein. If you do not mind, I will send her a copy of your memorandum and ask her to send supplementary or reply memo to you.

I will wait for your O.K. before going ahead.

I trust you will continue to keep me informed as things develop. Best wishes to you.

Sincerely,

Emory F. Via

EFV:bjr

P.S. re move to SRC & that Mike & Tommy probably had little pay & expenses.

Arizona Republic
Phoenix, Arizona
SEP 8 1968

OIC Negro Aid Role Expanded

Center Program Is Training, But It Extends Hand

By CHARLOTTE BUCHEN

Herb Boyer, a leading voice of the Negro through Phoenix' Opportunities Industrialization Center, was talking about the troubles OIC is having completing work on its new center building.

The telephone rang.

A Negro student at Phoenix Union High School, excited, blurted out something about a threatened walkout at the school, police brutality and minority history not being taught right.

BOYER CALMLY told the youth to gather up his equally excited friends and meet him at the OIC office after classes.

The boy, accompanied by eight other students, said on arrival: "I told them we shouldn't do anything until we had talked to you."

This, in essence, is the story of OIC. Less than 1½ years old in Phoenix, it already has established itself as the organization designed to help Negroes help themselves.

Its basic role one of training and placing unemployed Negroes in jobs, OIC reaches out beyond that function to act as arbiter, counselor, critic and supportive force for Negroes striving to make a better place for themselves, whether in the area of employment or education, housing, or health.

AT PRESENT, OIC's chief concern, for practical reasons, is that its move Oct. 1 into a building at 39 E. Jackson is hampered because remodeling has been blocked by inability to get skilled electricians, plumbers, and the like to do this part of the work.

It is at that building that OIC will set up its own skill training center to train unemployed and underemployed men and women for in-demand, adequate-paying jobs.

Already OIC, without proper facilities and outside its role as a subcontractor for orientation for the federally-financed Concentrated Employment Program, has placed 116 people in jobs, including 75 who were on public welfare. They are earning from $1.65 to $3 an hour.

Through CEP, OIC has provided orientation for 320 enrollees and will continue to provide this service to CEP under its new federal contract for 1968-69.

ONE OF THE chief differences between OIC's own program and the one it conducts for CEP is that OIC enrollees receive no pay during their training periods. They are in OIC on their own initiative.

Because of OIC's self-help philosophy, Phoenix business, industry and union leaders are rallying around their cause.

A Phoenix bank leased OIC the building for the amount paid in annual taxes, $11,000, while materials for a full remodeling job, architecturally handled by Gabor Lorant, OIC provided its own unskilled labor, and union leaders had planned to provide contractors this summer for the electrical, cooling and plumbing work.

The problem is that constractors using skills got so busy this summer that they didn't have time to work on the OIC building.

NOW, SAID BOYER, OIC is getting desperate for this kind of assistance.

"We're hoping that some of these contractors will offer us their help right away so we can get into the building this fall."

In return for the help of business and industry, OIC plans to train people to fit their specific labor needs.

"We try to fit our programs to local industry's wishes," said Boyer. "Business is our basic support. As an example of how we try to work together, the Salt River Project recruited 22 people for jobs and turned them over to us to prepare them for their high school equivalency tests and to put them through our motivation and attitudinal program.

"During the six-week period in our 'feeder' program, 18 passed their GED (high school equivalency); two have two sections of the GED to complete and the other two have one section each to do. Those four are in our evening courses while working."

BOYER SAID this was a "highly successful program and we hope to do a lot more of this kind of thing for and with business and industry."

When OIC moves into its new building, it hopes to provide vocational training in at least nine skill areas. All of the job training will be provided according to the needs at the time of business and industry. This means there will be continual change in the kinds of skills taught and a need for many different kinds of equipment suited to the skill being taught. Hopefully, such equipment will be loaned or donated by industry.

Already the city of Phoenix has answered one problem for OIC — that of providing hot lunches for the working men and women. Out of the old Arizona Hotel, which the city acquired for land, the city turned over to OIC, for a $1 a year lease fee, $23,000 worth of hotel restaurant equipment.

"WE'LL TRAIN our own people as chefs," he said. "As they move out into jobs in restaurants, more will come in, and in the meantime, other trainees will be fed.

"We're trying," Boyer said, "to stay clear of federal funding. We know the local community can't totally support the OIC program but we feel it can do a large part.

"If we do this, the federal government then can't manipulate and control. Today, there are 96 OIC's operating in the country and the most successful ones started like we're starting — slow.

"But, once you've got it, it's yours and self-initiative is not left out. We've got a lot going for us. The business community has been wonderful."

Equal Hiring Gains Made in Banking

BY WALTER BILITZ

Banking, long viewed as essentially a white man's industry, is becoming less so with the hiring of Negroes, Puerto Ricans, and other minority group representatives, and Illinois banks are making good progress in this effort.

But the banks, and the industry itself, still have a way to go before equal, nondiscriminate hiring is the general practice.

This is what Robert A. Wallace, assistant secretary of the treasury, told a conference on equal employment opportunity yesterday in the Conrad Hilton hotel.

Review President's Order

One aim of the conference—attended by some 200 bankers and sponsored by the Illinois Bankers association, the American Bankers association, and the treasury department—was to review provisions of the President's executive order of November, 1966, requiring banks holding federal deposits to eliminate all discrimination in the hiring and promotion of minority-group individuals. Wallace is in charge of enforcing that order.

Wallace presented employment figures for 109 Illinois banks for the years ended in April of both 1967 and 1968.

Minority Employment Grows

"In comparing the data filed by [these] banks, we find that total employment grew from 27,816 to 29,604 and that minority enrollment grew from 8.1 per cent to 10.1 per cent," he said. "In other words, 1,026 of these 1,788 new jobs, or 57 per cent, went to minority groups. For the area as a whole, this is a good start.

"For Chicago, which is in-

Growers Hard Hit By Cannery Strike

Migrant Camps Little Improved on Va. Eastern Shore

By Hank Burchard
Washington Post Staff Writer

ONANCOCK, Va., Sept. 14—Hopes for improvement of the migrant labor camps on Virginia's Eastern Shore are being plowed under along with thousands of acres of unharvested crops in Northampton and Accomack counties.

The season now ending has been one of the best in recent years, but the national strike against the Campbell Co. knocked the bottom out of the vegetable market. With the Shore's economy depressed, investment in camp improvements is expected to be even less than in past years.

About 2500 acres of tomatos alone have been plowed under, according to the Virginia Farm Bureau. Farmers who did harvest tomatos have had to sell them for as little as 50 cents for a ⅝ bushel, half the going price during the Depression. The bulk of the Shore's garden truck normally is sold to Campbell and the Federal Government does not subsidize such crops.

"The growers are cutting costs as much as they can," said a local agricultural agent. "It's always the camps that get cut first."

The market disaster, a Farm Bureau spokesman said, "affected every major crop. Most of the farmers recovered little more than cost. Some didn't get that."

One result of the market failure was a surplus of field labor instead of the shortage expected this summer. Foul conditions in the shore's 100-odd camps last year led the U.S. Department of Labor to drop both counties from the Federal labor recruiting service, the main source of workers.

The camps, according to Health Director Belle Fears, are generally somewhat improved over last season. "They get a little better every year," she said.

There apparently are only four camps in the two counties that substantially meet Federal standards. Three were built last winter and one was extensively remodeled.

A sample survey of the others showed most to be much the same as last year: rundown shacks, filthy pit privies, garbage and flies everywhere. They have a unique and clinging odor.

One difference in the camps this year is that the farmers are keeping a much closer watch on who visits them.

Most repairs and improvements have been makeshift, natural enough since many of the buildings are not worth tearing down for salvage lumber.

The four largest camps, owned and operated by the local farm bureaus, show little sign of improvement. Announced plans to replace them with two new camps are still "under study," with no dates set for construction.

The Shore camps contrast sharply with those of the Shenandoah Valley, which, if dreary, are nearly all of sound construction, with hot and cold running water and flush toilets.

One Winchester camp, run by an apple growers' cooperative, spent $50,000 for a new mess hall this year. Few Shore camps have even an old mess hall; the workers eat in their rooms or sitting on the ground.

"As long as these (Shore) farmers can get workers, they'll never do much with these camps," said a Shore resident who used to do volunteer work in the camps "until it got so depressing I had to quit. Nothing ever changed."

The labor crunch may come next season, if the market is normal and the crops are good.

20 OF MINORITY GROUPS FINISH NEWS CLASSES

New York, Sept. 15 [Special] — Twenty members of minority groups who completed an intensive summer course for careers in radio and television news got certificates from the Columbia university graduate school of journalism recently.

Prof. Fred W. Friendly, the program director, presented the certificates at graduation exercises in John Jay hall on the Columbia campus.

The aims of the course were to bring more members of minority groups into the broadcast news field and to aid members of such groups already working on station and network news staffs to improve their skills and further their careers. Of the graduating students, 17 were Negroes; two were Mexican - Americans; and one a Puerto Rican.

WASHINGTON POST SEP 17 1968

18,161 Placed In Summer Jobs

By Jared Stout
Washington Post Staff Writer

Public and private employers in Metropolitan Washington hired at least 18,161 young people this year, making the summer of 1968 the best yet for youth jobs.

Government agencies hired 14,350 persons between 16 and 21 years old, while private employers took on 3811 youths, according to figures made public yesterday by the United States Employment Service and the Washington Chapter of National Alliance of Businessmen.

The figures were verified in a survey conducted by the three agencies that undertook the hiring and placement of young people—NAB, the Metropolitan Washington Board of Trade and the USES.

The largest gains in summer youth employment were made by private employers. The 3811 youths hired by more than 500 companies amounted to more than 10 times the verified placements made last year.

In the public sector, a spokesman for USES said that as of Aug. 3, 14,350 young people had been hired of which 8572 were from disadvantaged families—families on welfare or those earning less than $3500 annually.

While the over-all summer job picture was better than it was last year, spokesmen in the youth job drive conceded that they had failed to make good on the pledge of private employers to hire 4752 youths.

That goal, set for Metropolitan Washington last spring by the NAB, was missed by 941, primarily because of the April disorders in Washington, officials said.

More than 900 of the job pledges that went unfilled were from companies in the hotel, restaurant or tourism field, according to the survey. Five companies that had pledged jobs said a change in ownership had prevented hirings. Another 20 jobs went unfilled because employers said no applicant sent to them was "suitable."

Werner Fornos, No. 2 man in the NAB chapter for Washington, said the businessmen's group was "very pleased" by the response of private employers.

However, he said, the summer job effort should be replaced ultimately "by a year-round program that seeks to provide not just summer but after-school jobs as well."

Fornos, who acted for former Army Secretary Stephen A. Ailes throughout most of the job drive, said "by and large, employers were surprised and pleased" by the performance of youths hired this summer.

All of the summer youth jobs provided by the private sector went to youths who were disadvantaged, compared to 60 per cent of the government jobs.

Fornos said that while the NAB was gratified by the response of private employers, improvements could be made in future summer job programs.

Among those he suggested were earlier placement of school-age youths in jobs and simplified procedures for them to learn where jobs are available.

He also suggested that more sophisticated screening be provided so private employers can get the most talented of those seeking summer work.

BANK HIRING
(continued)

cluded in the above, 37 banks were compared. Total employment grew from 21,231 to 22,636. Minority group employment grew from 1,981 to 2,937.

"In other words, 68 per cent of all new jobs in Chicago went to minority groups. This represents an increase from 9.4 per cent to more than 13 per cent."

He added, however, that 72 Illinois banks outside of Chicago still have no Negro or other minority-group employes, or at best only one or two. In this group, minority employment rose by only 60 persons, from 176 in 1967 to 236 in 1968, he said.

FARM WORKERS BATTLE FOR JUSTICE

A teaching unit for elementary schools on the struggle of the farm workers for collective bargaining

prepared by two New York City classroom teachers, Roberta L. Fass, and Jacqueline F. Lander, for the United Federation of Teachers, AFT Local 2, and reprinted by the American Teacher for AFT members throughout the country who may wish to use these plans.

HUELGA!

'With their hands, sweat, and sacrifices, the farm workers are building a monument—their union.'

—Cesar Chavez

A California farm worker trudges between rows of grape vines (top). Her children, if they go to school at all, will end up in a crowded, dirty classroom like the one below.
(Photos by Jon Lewis)

BACKGROUND FOR TEACHERS

Many of the problems in America in 1969 have to do with human relations: acceptance of people, negotiations, improved communications, dignity, and fair play.

Organized labor is conducting "Don't-Buy Campaigns" against California table grapes in many cities throughout the country in order to help the United Farm Workers Organizing Committee (UFWOC) succeed in getting the growers to recognize their Union and bargain with it.

The problems of the migratory farm workers go back as far as 1869, with the linking of the Central Pacific and Union Pacific Railroads. Chinese coolies who had been imported to work on the railroad were now available to be used as cheap labor in agriculture. In 1882, the Chinese Exclusion Act was passed in order to prevent them from taking jobs away from the whites. But, by this time, California had such a vast investment in the cheap labor system that all efforts were directed toward perpetuating it. In order to keep this type of labor available, workers were imported from Japan, Mexico, the Philippines, Hawaii, and the Caribbean. In the 1930s, they were joined by an influx of migrant workers from Oklahoma and other Midwestern states who had lost their farmlands to the drought.

During the Korean War, Public Law 78 was passed which allowed Mexican nationals, braceros,* to be brought in under a program of contract labor. Many individuals continue to commute seasonally to California and cross the border from Mexico illegally.

Today, the migratory labor force in California consists of these original groups plus blacks from the Southeastern states and Puerto Ricans. California has the finest agricultural industry in the nation due to its favorable climate, fertile soil, and use of modern techniques. In addition, it has a steady supply of low-paid workers.

The U.S. Senate Sub-Committee on Migratory Labor, in its 1968 report, said of these low-paid laborers: "No other segment of our population is so poorly paid yet contributes so much to our nation's wealth and welfare . . ."

The average American family spends $1,500 a year on food. The average farm working family earns only $1,278 a year. An obvious conclusion from these facts is that farm workers do not earn enough money for food nor for any of the other basic necessities. Due to the temporary nature of their work, their housing is substandard. Farm workers have been subjected to a lack of safety equipment on machinery as well as overexposure to agricultural poisons, dust, insects, and pesticides. In the fields there is a total absence of sanitary facilities such as portable toilets, equipment for washing hands or supplying fresh drinking water. There is a high incidence of illness among the workers due to their poor living and working conditions.

In the last 100 years, farm workers have attempted many times to organize but have met with little or no success. A major reason for their inability to unionize stems from their specific exclusion from the National Labor Relations Act (NLRA). This act protects the rights of employees and employers through the establishment of rules and procedures for negotiation of labor contracts through collective bargaining. It guarantees federally supervised democratic elections for union representation. Many other workers are protected by this law.

The vast majority of farm workers lack coverage by laws providing workmen's compensation, jobless benefits, minimum wage and full social-security benefits. Children working in agriculture are excluded from child-labor and school-attendance laws. Without collective-bargaining contracts, workers do not have protections that other workers take for granted; for example, job security, overtime pay, holidays and vacation with pay, health insurance, grievance procedure, sanitary toilets and drinking water, rest periods, and so forth. For many, basic welfare and medical services are still effectively out of reach.

Cesar Chavez was a migrant farm worker who came from a family of migrants who traveled up and down California following the crops. From 1952-62 he was a community organizer for the Community Service Organization (CSO). Because of his deep feelings about the suffering of farm workers and his conviction that farm workers had to protect themselves and improve their conditions through their own organization, he left the CSO and took his wife and eight children to Delano, California. There they lived on farm work and he began to organize the National Farm Workers Association (NFWA). Through strikes, boycotts, and publicity campaigns, NFWA won 12 contracts with California wine grape growers. In 1967, the Union turned its attention to table grapes, which is the number one industry in California.

In their attempts to achieve collective bargaining, the workers selected the Giumarra Vineyards Corporation, the world's largest shipper of table grapes, as a major target. When the workers went on strike, Giumarra obtained strikebreaking injunctions and imported Mexican braceros and illegal immigrants as scabs. These actions have left the workers with no recourse except to seek public support for a consumer boycott.

Hundreds of farm workers and student volunteers spread out this year to cities all over the country to organize the boycott. This action proved successful as sales and prices of grapes all over the country fell. This has led to a worldwide consumer boycott of all California fresh table grapes until the growers negotiate.

The primary goal of the farm workers' action is to obtain union recognition and assurance of good-faith collective bargaining. The best way to achieve this goal would be to include the agricultural industry under the National Labor Relations Act. Other industries with perishable products that have a seasonal need for a large number of temporary employees are covered by the NLRA and have successful collective-bargaining relationships. An example of such industries related to agriculture are fruit and vegetable canning and freezing operations, and sugar processing.

New York consumes 20 percent of the California table grape crop. In February, 1968, 50 grape strikers from Delano, California, arrived in New York to initiate their boycott campaign. They have been successful in their efforts. Table grape consumption has declined. As AFT members, we have honored their boycott. As teachers, we can help the agricultural workers in their struggle for collective bargaining. The following unit has been prepared by members of the United Federation of Teachers, AFT Local 2, to assist you to develop concepts with your pupils to acquaint them with that struggle.

POSTSCRIPT

The United Farm Workers Organizing Committee is now in its fourth year of a strike and boycott against growers of California grapes.

Within the past few months the farm workers began to discover the dangerous effects of pesticides upon the pickers. The treatment of the afflicted workers has now become a major concern of the Organizing Committee.

The growers claim that the pesticides are safe, and

*braceros—literally means day laborers

The banner reads 'We shall overcome' in Spanish; the speaker is Cesar Chavez. (Photos by Jon Lewis)

'Farm workers of all the races have their way of life in common. It separates us from those inner towns, but it can unite us in our own.'

—Jon Lewis, 'From this Earth'

that the farm workers are using the pesticide issue to promote their boycott.

The UFWOC feels that the growers' reaction is typical of the attitude of the employers toward the legitimate concerns of the grape workers.

LESSON I INTRODUCTION

AIM: FARM WORKERS ORGANIZE TO IMPROVE THEIR LIVING AND WORKING CONDITIONS

I MOTIVATION

Introduce picture at top of Page 14 in conjunction with the following questions:

1. What kind of home does this child live in?
2. What is the child wearing?
3. What does this tell you about the climate in which the child lives?
4. What things do you find in this picture that you don't find in your house?
5. What in this picture shows you that this family moves around a great deal?
6. Why do you think this family needs a truck?

II CONCEPTS TO BE DEVELOPED

It will be necessary for the teacher at this time to present this information:

1. This child belongs to a migrant worker's family.
2. Migrant workers follow the crops as they ripen in different parts of the state of California.
3. They cannot establish a permanent home. They live in temporary shacks. They have substandard living conditions.
4. Children work. They do not go to school. There are no child-labor laws or compulsory-education laws to protect these children.
5. Working men need unions to protect them, to give them employment, and to improve their working conditions.
6. Up until now, migrant workers in the state of California have lived under these substandard conditions because they have not had the right to unionize. (Exclusion under NLRA)
7. The large grape corporations have prevented them from unionizing.
8. Now grape pickers have decided they must unionize in order to improve their working conditions.
9. They organized a strike..
10. Then they organized a boycott and other labor unions have supported it.
11. Grape consumption has dropped.
12. If the boycott continues to be effective, then the growers will have to bargain with the migrant farm workers union.

VOCABULARY

Migrant	Collective Bargaining
Crop	Standard of Living
Harvest	Living Wage
Labor Union	Consumer
Strike	Boycott

UTILIZE CAPTION

Every California grape you buy helps keep this child hungry. Don't buy California grapes.

SUMMARY

1. The American working man will want to form a labor union to better his conditions even where the law does not protect his right to unionize.
2. The worker employs strikes and boycotts to achieve his aims.
3. The consumer helps the worker by respecting a picket line and boycotting the product.

LESSON II "DECISION AT DELANO"

color film*

I AIM

To reinforce the understanding that labor organizations influence the living and working conditions of workers.

*This film may be obtained by contacting:
UNITED FARM WORKERS ORGANIZING COMMITTEE AFL-CIO
c/o ILGWU, LOCAL 23-25
275 7th AVE.
NEW YORK, N.Y. 10001
TELEPHONE (212) 929-3239, 929-2896, 929-3094

II MOTIVATION

Use of key questions based on Lesson I.

1. What is a migrant farm worker?
2. What problems do migrant farm workers have?
3. What methods are they using to solve these problems?
4. What do they hope to achieve?
5. How does our boycott of grapes help them?

III PROCEDURE

1. Introduce film: "Decision at Delano."

Synopsis of film

This picture was filmed in Delano, California. There are interviews with actual workers who discuss their working and living conditions. Cesar Chavez, the organizer of the United Farm Workers Organizing Committee, speaks. This film is appropriate for intermediate grades. Vivid Technicolor and lively background music enhance the film's usefulness.

2. Show film.
3. Discussion.

IV SUMMARY

Summarize film in terms of:

1. How do the workers feel about their working and living conditions?
2. What actions are they taking to improve their conditions?
3. What do they hope to gain?
4. How can we help them?

LESSON III ACTIVITIES

I AIM

To Provide Activities That Will Reinforce Concepts Learned

II MOTIVATION

Further discussion of film: "Decision at Delano."

Lead discussion toward ways in which we can help the farm worker to achieve his goals.

III SUGGESTED LIST OF ACTIVITIES

1. Letter-writing campaign.

A. Send letters to the following telling them how you feel about the problems of farm workers:

a) U.S. Senators and Congressmen
b) Secretary of Agriculture
c) Secretary of Labor

B. Send letters to the following explaining the poor working conditions of the grape pickers and their need for collective-bargaining agreements with their employers.

a) Local storekeepers and supermarket chainstores.

C. Send a copy of your letters and any replies to:

National Campaign for Agricultural Democracy
110 Maryland Ave. N.E.
Washington, D.C. 20002

2. Supplementary Reading for Pupils

a. Gates, Doris—Blue Willow, Viking Press, 1940—level 5 to 9

The poor and temporary conditions of the migrant workers are explored through the eyes of a young girl, Janey Larkin. Blue Willow refers to Janey's treasured plate that she takes from place to place when her family follows the crops. She hopes that someday she may give it a permanent home where she can really make friends with the people across the road. (A sensitive book.)

b. Lenski, Lois—Judy's Journey, J. B. Lippincott and Company, 1947—level 4 to 8

A delightful story which portrays the loneliness that persists among migrant workers and migrant children in particular. The responsibilities that they must face make them old beyond their years. Their insecurities almost defeat them unless they have the "spitfire" quality of the young lady—Judy of this story.

Illustrations make the text even more readable.

c. Shotwell, Louisa R.—Roosevelt Grady, The World Publishing Co., 1963—level 4 to 7

Roosevelt dreamed of living in one place where he could get to know people and not be an outsider. Moving from one school to another, he had learned "putting into." If you put 3 into 10, for instance, you get 3—but what do you do with the leftover number? Papa said to throw it away and Mama said to save it till you need it. But Roosevelt wasn't so sure.

Excellent look at the life of migrant workers through the eyes of one black boy.

Illustrations help clarify the text and make it easier for children to identify with Roosevelt.

3. Visits to Supermarkets

Arrange for pupil visits to supermarkets and other stores. Pupils may determine if California grapes are being sold. If this is the case, pupils may speak to the store manager, get his point of view, and tell him theirs.

TEACHERS' BIBLIOGRAPHY

A. NONFICTION

a. Allen, Steve—The Ground is Our Table

With photographs by Arthur Dubinsky. Garden City, New York, Doubleday and Company—1966—141 pages

This slender volume is an excellent source book for the teacher. Photographs add to the words and could be effectively used in the classroom.

Moore, Truman—The Slaves We Rent

Photographs by the author. New York, Random House—1965—171 pages

Shotwell, Louise R.—The Harvesters

The story of migrant people—Garden City, New York, Doubleday, 1961—242 pages

Wright, Dale—They Harvest Despair: The Migrant Farm Workers

Boston—Beacon Press—1965—158 pages

This book not only chronicles the migrant's story in general terms, but contains vignettes on particular people this reporter interviews, thus personalizing their plight and making the accounts even more vivid and their story more important.

B. FICTION

Steinbeck, John—Grapes of Wrath—1939

Steinbeck, John—In Dubious Battle—1939

Steinbeck, John—Of Mice and Men—1938

'From This Earth'

There exists a profusion of books and pamphlets about the struggle of migrant workers, but none is so poignant or powerful as "From This Earth," a slim volume created by a San Francisco State College student as his master's thesis.

Most of the photographs in this four-page section of the American Teacher come from Jon Lewis' volume. His camera has found and come close to recreating the souls of his subjects—the homeless and hopeless men clutching a bag in each hand who have just arrived from Texas or Mexico to do their time as indentured laborers; the determined countenance of Cesar Chavez; the glint of joy and hope in the eyes of the farm workers when a victory is announced.

The photographs are the overpowering ingredient of this book. Lewis' pen writes quietly in the background, providing just enough information, through the voice of a laborer, to carry you from one picture to the next.

Copies of this volume are precious. Five hundred exist; they were "shaped by one hand, from photography through presswork." They are available for $5 from Jon Lewis, in care of Martha Shaffer, 700 Lake St., San Francisco, Calif. 94118. Hopefully, Lewis will find the means to print more. His book deserves wide circulation.—D.E.

La Causa Distribution Center—a clearinghouse for educational materials on the Chicano—the Mexican-American—represents a unique concept in that it offers through the convenience of one location, a selection of publications which express the Chicano struggle for liberation. The materials available were selected as a unit which complement one another through depicting our social history, our life in the barrio, and our contemporary thought.

Another important aspect of La Causa is the creation of a development fund to establish a publishing house to produce materials developed by Chicanos.

We invite your orders and inquiries.

Carrying their strike flag, farm workers man picket lines outside a packing shed. The union has gained strength in recent months.

LABOR

"Farm Worker

A harvest nears for Cesar Chavez

His Mexican-American farm workers are winning new contracts

Success appears to be in sight for California's farm workers union. Growers who opposed the union so bitterly for so long can hardly believe it. Other unions, religious leaders, and socially involved citizens who supported Cesar Chavez' hard-pressed Mexican-Americans are almost as incredulous. But both sides recognize the signs of a tide turning.

"Sooner or later, most farm workers will be working under union contracts," said Hollis B. Roberts, owner of Roberts Farms, Inc. Roberts had just signed a three-year agreement covering one of the country's largest farms—50,000 acres of grapes, citrus fruits, and more walnuts, almonds, persimmons, and clingstone peaches than grow on any other farm in the world.

Until recently, Roberts had denounced the United Farm Workers Organizing Committee and its charismatic leader as Communists. He concedes that he met with Chavez only because the UFWOC had struck his peach orchards and—for the first time—"we just could not get people to cross those picket lines and thin peaches." But he insists that he did not sign the contract purely for that reason. After long negotiations assisted by five Roman Catholic bishops (representing all 260 Catholic bishops in the country), Roberts became convinced that he had been wrong about Chavez and his union.

"You know, that Chavez is a truly religious man, a truly religious man," he says. "I think it will work out all right."

Ben Abatti, the largest melon grower in Imperial Valley, also agreed to recognize the union earlier this month. The UFWOC had struck his farm on a Thursday. The high school students who were his only replacements could not harvest melons fast enough to prevent them from rotting. "We became believers that weekend," says Franklin McDaniels, the El Centro attorney who represented Abatti.

Why it happened. Both these union victories were won because many farm workers will no longer cross a UFWOC picket line—a fact that marks an important change in the union's fortunes. In the past, farm strikes often failed because growers could recruit replacements—either natives or "green card holders" (Mexicans who commute across the border)—and because the strikers themselves tended to drift back to work. Growers claimed that the returning strikers were "voting with their feet" against the union. Chavez said hunger drove them back: "They have no reserve funds, no credit. They must work daily to eat daily."

Now the situation has changed. Widespread identification of the UFWOC with "La Causa," the Mexican-Americans' campaign to achieve dignity and material betterment by nonviolent means, apparently has affected farm workers in some areas deeply enough to keep them out when the union calls a strike. Financial contributions, including $3-million from the AFL-CIO since the campaign began in 1965, have made it easier for Chavez to keep organizing. And a countrywide boycott of California table grapes, sufficiently effective over-all to hurt the growers, has fostered a feeling that the farm workers are not alone.

All this has led to a radical change of tactics by the farm owners, who formerly opposed union representation elections for farm workers (exempt from Wagner Act guarantees of voting rights for industrial workers). A group of California's major growers has now retained the public relations firm of Whitaker & Baxter, at an annual fee estimated at $1-million to $3-million, to lobby for a federal bill to create election machinery for farm workers.

The bill would also outlaw strikes at harvest time, a provision roughly parallel to limiting industrial strikes to nighttime when plants are closed, according to labor spokesmen. Senator George Murphy (R-Calif.) is sponsoring the bill, whose chances of quick passage are slight.

'Frankly, we Anglos don't know how the Mexicans think'

New doubts. Meanwhile, most growers continue to insist that they will not permit elections in the absence of a law. But they no longer claim that their own workers would vote against the UFWOC, a change almost as striking as the farm workers' new willingness to respect the union's picket lines. "Frankly, I don't know how they would vote," says Richard Graeser, an Imperial Valley grower. "We Anglos don't know how the Mexicans think."

These major changes in attitude stem from what would seem to be minor changes in conditions. In the past

'Chavez wants to control the food supplies of our country'

five years, the UFWOC has won contracts covering only about 15% of the California wine grape industry, 7% of the table grapes, and a tiny proportion of other crops. Of the 165,000 to 285,000 (depending on season) farm workers in the state, a mere 20,000 are members of the UFWOC, and only half are covered by union contracts.

A typical contract may add only 10¢ to the hourly rate for grape pickers (bringing it to $1.75) plus 25¢ to the rate per box and another 10¢ an hour for union clinics in areas that lack medical care. Other clauses may require growers to tell workers where and when they plan to spray pesticides and what pesticides will be used (opposed by growers as a revelation of trade secrets); provide for the workers' first holidays and vacation fund; and give the union a union shop and a role in setting piecework rates.

In a broader context, however, the small changes loom larger:

- No agricultural union has ever matched UFWOC's record, and many have tried.
- Chavez has won every election he has been allowed to enter.
- UFWOC's organizing pace is increasing. Twenty-two growers have recognized the union within the past two months and all but one have already signed contracts. The union took years to win its first few contracts.
- The grape boycott—which growers had hoped would be hamstrung by the appearance of union-label grapes—shows signs of being strengthened.

A spot check of supermarkets in several cities suggests that boycotters, far from being confused by the new "acceptable" grapes, are rechanneling their efforts to make sure that the grapes on sale are actually union-label fruit. Some markets display the grapes in their original boxes, marked with the UFWOC label, an Aztec thunderbird. And some supermarket managers seem relieved that now they can sell grapes without antagonizing anyone.

The ability to continue the boycott of nonunion grapes has more than symbolic value. Lionel Steinberg, a major Cochella Valley grape grower and the first in his area to sign with the union, estimates that he lost $400,000 last year as a result of the boycott. "It's ridiculous to pretend it doesn't hurt. Of course it does," he says.

Union reaction. Indeed, Chavez' only loss of support has come from a group whose defection probably does him more good than harm with the general public. Extremists who had originally embraced the farm workers' campaign have become disenchanted with the UFWOC's close ties to the National Council of Catholic Bishops, the Migrant Ministry of the National Council of (Protestant) Churches, and various boards of rabbis. They also resent Chavez' emphasis on the Catholic content of "La Causa" and his hard line against activists who would prefer such tactics as crop burning to the slower, nonviolent strike or boycott.

This month, young radicals meeting in Los Angeles formally denounced Chavez' "no-win policy of nonviolence" and deplored his failure to "unite students and workers to fight the . . . oppression now going on."

Only one element appears unchanged in the California farm labor picture. Growers' organizations still insist that the UFWOC is essentially a revolutionary conspiracy. "Chavez wants to control the food supplies of our country for his own personal power," says Charles Woods, head of the Imperial Valley Farm Bureau. Allen Grant, president of the California Farm Bureau Federation, recently told a private meeting of growers that Chavez is using "Communist tactics" to get that control.

High school students were recruited to pick melons during UFWOC strikes.

But if the opinions of many growers have not changed, Chavez' chances of creating a viable union have. California's farm owners and farm organizations are not about to reverse course abruptly or collapse, but neither are the trends favoring the UFWOC likely to cease. It seems probable that increasing numbers of growers will fall away from the farm owners' united front as their fields are struck or as they assess the possibility of a damaging strike. It would take a foolhardy prophet to set a timetable for the process—and an unobservant one to deny that it is under way. The farm workers union has begun to succeed. ■

Drawing the line for auto talks

The United Auto Workers and major auto makers in mid-July will open the year's most critical contract negotiations, and the union says "recessionary" economic conditions will not affect bargaining. Last weekend, the UAW warned the industry that a peaceful settlement will cost more than 8% a year; auto companies are prepared to resist even 8%.

The last time the UAW negotiated during a recession was in 1958. Then the union settled peacefully—at about 2½% a year, or at least 6¢ an hour. This year within the industry, there is a strong feeling that companies will be lucky to sign contracts at three times that price.

Leonard Woodcock, the UAW's new president, will lead union negotiating committeemen in the formal opening of bargaining with General Motors on July 15, Ford on July 16, and Chrysler on July 17. The contracts negotiated in 1967 will run out Sept. 14. Ordinarily the hard bargaining comes in the two or three weeks before expiration.

Procedures. Following past patterns, the UAW and the companies now are jockeying for favorable public positions. A few days ago, employers warned that another big settlement will bring higher prices and increase the problem of competition from abroad. Malcolm L. Denise, Ford's vice-president for labor relations, said the industry "faces serious challenges" and possible job losses because U. S. labor costs are "outclimbing" those in any other country. In reply, Woodcock dusted off an old Walter Reuther "show-the-books" proposal: The union is willing to reduce demands if the companies can show "adequately and acceptably" that they cannot meet UAW demands and make a "reasonable" profit without raising prices.

"We will not go after every dollar we can get," Woodcock said. "It is not our position that the public be damned. But we have to have a substantial settlement." Would 8% a year be enough? Replied Woodcock, "Enough obviously means more than 8%."

Woodcock said industry profits have been good enough to warrant the wage increase—amount unspecified—that the UAW says must be forthcoming to avoid a strike against one of the Big Three. Industry spokesmen disagree. They cite lower sales and profits as reasons for retrenching. ■

48 Contracts Signed: AFL-CIO News 2-4-72 Farm Worker

11 New Grape Ranches Join Growing Union-Label Ranks

Delano, Calif.—Eleven more grape growers signed union contracts to broaden the United Farm Workers' sweep into the once-closed field of California table grapes.

Union negotiators moved from ranch to ranch to consolidate the spread of union-won conditions to additional thousands of field workers.

UFWOC Dir. Cesar Chavez and Larry Itliong, his second in command, continued to press for meetings with more growers, and to make arrangements for elections at the signed-up ranches. They look to a breakthrough soon in the hard-core of Delano area growers who have been resisting the union under the leadership of Giumarra & Son, the biggest holdout.

Large employers signing union contracts included John J. Kovacevich of Arvin, and Bagdasarian & Co., which markets Mr. Grape, Pasho and Bagdad brands, grown on more than 1,000 acres in the Coachella area.

Other growers signing up were: F. & M. Co., Fresno marketer of grapes under the F & M and Supreme labels; Sammy LoGreco, producing grapes in the Arvin-Lamont area and using such labels as Camelot and Galliano; Tony De Mallo, Fresno; Tony George and Galderas & Son, both of Orosi, near Fresno; the American Produce Co., Los Angeles; Edward G. Camderian, Coachella; the Castellani Co., Fresno, and Ben Mardian, Phoenix, Ariz.

Five other growers are still discussing contract terms and election procedures. After the grape harvest, the union plans to follow the crops into other areas of the highly productive California and Arizona fruit and nut country.

All the contracts have the standard provisions contained in the first pioneering agreements signed by UFWOC negotiators and growers in the series that began Apr. 1 at Coachella.

They provide a minimum wage of $1.75 an hour, plus a bonus payment of 25 cents a box for pickers; 10 cents an hour additional per employe for the union's health and welfare fund; 2 cents more per box for the UFWOC Economic Development Fund, and protection against the use of "hard" pesticides in spraying the fields against insect infestation.

The Economic Development Fund will, as the union plans it, protect members against layoffs or retirement because of age, physical disability or automation of the ranches.

All the contracts bind the growers not to use insect-killing sprays or powders that may cripple or incapacitate employes working in the fields alongside spraying rigs or under crop-dusting planes. Union members have testified to the danger from uncontrolled use of "hard" poisons.

A key inducement to growers is the "bird" that consumers insist on seeing before buying grapes. The bird is the union label or "thunderbird"—an Aztec eagle that has been designed by UFWOC for use on every box of grapes produced under union contract.

Food markets across the country report continuing heavy sales of union-label grapes. In some cities, the arrival of UFWOC label grapes

(Continued on Page 7)

11 More Growers Sign Farm Union Contracts

(Continued from Page 1)

beginning with the first harvest in June has been announced in full-page newspaper ads.

Union committees in more than 50 cities are helping promote the sale of union grapes while continuing to push the nationwide boycott of non-union grapes declared by UFWOC in 1967 and supported by the AFL-CIO and its unions ever since.

The farm workers credit the boycott with moving growers to end their refusal to meet with the union and to bargain contract terms with it for the members it represents. They give credit also to workers who refuse to cross union picket lines.

First contracts negotiated by the UFWOC were with wine grape growers in California. This year the union broke new ground in winning contracts with table grape ranchers who previously had refused to sign. To date, 48 contracts have been signed.

At the same time, the union has been chosen as bargaining agent for farm hands at every ranch where a poll has been taken, either by secret-ballot vote, by a check of membership cards against the payroll or by some other method.

The first polls were supervised by a committee of three clergymen, selected by the union and by ranch owners. Since then, the method has varied from ranch to ranch. But in every case the choice of the union was free and enthusiastic, according to AFL-CIO Dir. of Organization William L. Kircher, who has taken part in many of the key negotiations.

M— Farm Labor

AFL-CIO NEWS, WASHINGTON, D. C., JULY 25, 1970

Subhuman Conditions:

Story of Migrants' Misery Related at Senate Hearings

A pattern of misery and death caused by inhumane living conditions among migrant farm laborers in Florida, Texas and Michigan was drawn in testimony before a congressional panel.

Large families are poorly fed and crowded together in rundown housing projects without heat, clean water or sanitary facilities, the Senate Subcommittee on Migratory Labor & Public Welfare was told.

The result is a heavy incidence of disease, four physicians said in their testimony.

Children have died after drink- the only water available at a migrant camp in Texas, another witness related. And "we have had dogs die from drinking the water, which is filled with garbage, fecal matter and other pollutants," said Efrain Fernandez, who works with the AFL-CIO Farm Workers in the Rio Grande Valley.

The four doctors said that such conditions continued to exist a year after the federal government instituted a $15 million health program for migratory workers.

The testimony of the doctors centered on the conditions they discovered in Hidalgo County in southern Texas. They were among a group of 15 physicians who examined 1,400 members of migrant families in a study financed by the Field Foundation.

They told of children who were often dying of neglect or growing up without hope because malnutrition and disease had left them unequipped physically or mentally to face life.

Most of the children were infected by intestinal parasites and skin diseases and many had ear infections that left them partially deaf, said Dr. Raymond M. Wheeler of Charlotte, N.C.

The doctors also said that migrant families had an infant-maternal mortality rate one-third to one-fourth higher than the national average.

"We find destitution and exploitation of men, women and children which we would be ashamed to describe were we not so horrified by their presence," one doctor told Sen. Walter F. Mondale (D-Minn.), chairman of the subcommittee.

A number of large corporations, including Coca Cola, were charged with having "callous disregard" for impoverished migrant workers who harvest the crops.

Coca Cola bought out Minute Maid orange juice 10 years ago and owns or controls about 30,000 acres of Florida citrus groves. Other products of the company include Snowcrop orange juice, and HI-C and Real Gold fruit drinks.

UFWOC Rep. Fernandez declared that the conditions of the migrants — mostly Mexican-Americans — at many Florida and Texas farms were subhuman.

He also said that state and local institutions have tried to suppress the culture of the Mexican-Americans, who have suffered severe psychological damage as a result.

"Our children fall behind in school not because they cannot learn but because the schools do not teach in our language," Fernandez observed. "Our people are taught to believe that our cultural heritage is not worthy of respect—they are taught to be ashamed."

Fernandez also appealed for congressional support for farm worker organizations seeking to help migrant workers.

"We think the solution is in our own efforts to organize and have power over our own affairs. . . . We don't want paternalism," he declared.

The Farm Workers

(Continued from page 1)

Hugh A. Donohoe succeeded him. He had been helping to resolve farm workers' problems even before the strike began. We were and still are lucky because he left Fathers Mark Day and David Duran to work full time with the union. The former is EL MALCRIADO editor and the latter is finance coordinator in the Accounting Department.

Migrant Ministry

The Migrant Ministry and its director Wayne Chris Hartmire, were deeply involved in the initial movement for the farm workers in the National Farm Workers Association. In the joint strike of the Agricultural Workers Organizing Committee, AFL-CIO, and NFWA, I learned that Reverend James Drake was (and still is) the Administrative assistant to Cesar Chavez. Jim was one of the very few individuals who assisted Cesar in his administrative functions for the last five years. His wife, Susan, helped in different office departments. Phil Farnham was in charge of printing materials for the pickets. Many more from this group came to reinforce the effort. They worked in the offices as organizers and now are scattered all over the boycott centers in the U.S. and Canada. To mention a few, I recall Nick Jones and Virginia, Jan Van Pelt and his wife, Fred Dresser, Lupe and Kathy Murguia, and Gary and Kathy Olson.

The Migrant Ministry was the first church organization that donated money backing the NFWA membership's decision to join the AWOC in the grape strike. This merger helped Cesar Chavez establish an effective Farm Workers Public Relations Media that later excelled the growers' famous multi-million dollar Whitaker and Baxter Public Relations Firm. It was amazing and a mystery how an intricate network of a national and international table grape boycott started and evolved into the most powerful weapon, driving growers to their knees and to the negotiating table. It was known, however, the harvest of union victories resulted from the unprecedented cooperation of the consumers. To achieve peace in the industry and in the marketplace, every effort, dollar, talent, knowledge and skill was successfully coordinated and directed to justify and win the farm workers' cause.

Sons of the Covenant

In all kinds of meetings were those of the Jewish faith. They were adequately equipped with professional talents and skills basically needed and donated in structuring the farm workers' union. They, too, contributed much in broadening its goals.

As individuals, they were among the first ones involved. Fred Ross taught Cesar Chavez the principles of organizing and conducting meetings. The neighborhood house-meetings led to the CSO (Community Service Organization) which the middle-class Mexican-Americans used for economic and political expediencies and killed its original intent. CSO's spirit and ideal were resurrected in a newer service organization, called the NFWA, that eventually brought the Mexican farm worker into the mainstream of AFL-CIO Unions. Fred Ross' tutorship and guidance transformed Cesar Chavez from the Zoot-Suit leadership in the "Sal Si Puedes" streets into the directorship of the most famous farm workers' movement in the world.

With the help of a Catholic nurse, Peggy McGivern, Dr. Jerry Lackner started the Terronez Memorial Clinic; with Jerry Cohen, and later, Chuck Farnsworth and Bill Carter, the Legal Department was formed; the Service Center Legal Counsel was originally led by Dave Averbuck and now is headed by Frank Dennison; Jerry and Jane Brown started the Boycott Department; Marshall Ganz and Jessica Govea organized the boycott centers in Montreal and Toronto, Canada. Marshall is a talented organizer and negotiator and was consulted over critical union decisions. Lawyer Gary Bellows took up union cases without pay and David Fishlow edited EL MALCRIADO. Under-graduate legal student Peter Williamson helped others research for the Legal Department last year. Now a lawyer, he is serving a branch office of the UFWOC in San Juan, Texas.

Elaine Elinson represented the farm workers in the international grape boycott in Europe and was succeeded by Donna Haber, who still leads the European boycott. Freddy Silberman, Mike Cushman and Jennifer helped me in London, England and Victor Pestoff and Britt Marie, Ester and Christine, in Stockholm, Sweden.

Representatives of the American Jewish Congress and Rabbis came to Delano giving us the idea of a kibbutz (community). In our jurisdictional quarrel with the Teamsters Union, the committee that brought us together consisted of a Protestant minister, a priest, and a rabbi, who was chairman. There were many more helping in different ways, from boycott to finance.

Catholics

In the Catholic side, Bill Esher was the first editor of EL MALCRIADO. At that time he was working with Mary Smith, Marcia Sanchez, Donna Haber and some other students. Le Roy Chatfield, with nurse Marion Moses, researched for the Robert Kennedy Medical Plan and later became the plan's director. He was also instrumental in the purchase of "Forty Acres," the homesite of the farm workers' union. His wife, Bonnie, helped mostly in the Service Center. Andy Imutan with Luming proved himself as one of the top boycott organizers in Boston, Maryland, and New York City.

With medicine in carton boxes on an impoverished grapebox table in Dolores Huerta's garage, Peggy McGivern treated sick strikers. Her sympathetic understanding and care in her work helped develop the Terronez Memorial Clinic. As Peggy joined the boycott staff, Marion Moses took her place and still manages the clinic today. Marion toured the United States and Canada and spoke to diversified groups stres-

(Continued on page 8)

Solitary Prophets

(Continued from page 5)

sentenced to death obtained clemency. They all met their death courageously. Ammon writes: "Their spirit lives wherever there are young people who choose, as Camus tells us we must choose, to be on the side of the executed rather than on the side of the executioners, if we are not to be executors ourselves."

The next chapter is a sequel to the preceding one, since it deals with John Peter Altgeld, governor of Illinois; he did pardon three other men who had been sentenced for the Haymarket bombing besides the five who were hanged. He was accused by his political enemies of being an "anarchist," a "demagogue," "un-American," "apologist for murder," etc. He had never been a clear thinking radical, Ammon writes, but he had consciously placed himself in power where he was able to do something for those weaker than himself. He died a poor man, because he refused "to have anything to do with shady deals," and had made the necessary sacrifices.

There is a connection between Altgeld, protesting against the breaking of the Pullman strike by President Cleveland, and the hero of the following chapter, Eugene V. Debs, who was jailed for his participation in the strike. He was later imprisoned because of his opposition to World War One and exchanged notes with Ammon, who was serving a similar sentence. His words in court in 1918 were:

"While there is a lower class, I am in it; while there is a criminal element, I am of it; while there is a soul in prison, I am not free."

Another chapter of the book presents Clarence Darrow, "lawyer of the damned," who saved so many men including Leopold and Loeb. Besides referring the reader to a number of major works concerning Darrow, he gives some highlights of interest. He met Darrow in 1920 in New York.

In the chapter devoted to Yukeoma the Hopi, he treads familiar ground, his interest in the Hopi Indians having been one of the dominant interests in his action as a defender of the underprivileged. Of the courageous leader of the Indian people, he says: "The grand old man of the Hopi personifies man as a part of nature . . . he fought against the opinion of the mass of Americans, as did Thoreau and Garrison." And further: "'Let my people go!' has been the cry from the time of Moses and the Pharaohs to the time of Martin Luther King."

Speaking of John Taylor, third President of the Mormon Church, who died in 1897, Ammon deals once more of a land and a community which he knows well, having lived in Utah since 1961 and studied Mormon history, while working at Joe Hill House, up to his death. If he brings Taylor close to us, he does so even more in his portrait of Bartolomeo Vanzetti, who is truly a man of our time and of all times. Ammon, like most people of his age, remembered well the tragic day of the execution of Sacco and Vanzetti, which shook not only America, but the entire world.

Malcolm X, whom Ammon next describes, was his and our contemporary and his memory is fresh among us. Ammon says of him: "He had the logic of Darrow and the charisma of Debs. He had the courage of Mother Jones and Vanzetti." In spite of Malcolm X's vivid portrayal, we regret that the author decided not to include in his book another great black leader who was destroyed: Martin Luther King.

Of the two women portrayed in the last chapters of the book, Dorothy Day and Helen Demoskoff, the latter was, perhaps, the easier to describe, because she was the champion of one cause, the Doukhobors' ideal of peace and community, within one society. Their history started in Russia with their refusal to carry arms and obey the State, but Helen's courageous struggle took place in Canada; it was against the laws of that country that she protested and was sentenced there to eleven years of prison. Ammon knew her well, having met her since 1941, and often visited her at her farm in British Columbia; his last visit was a year before his death, when he was writing his book. He says of her: "Helen Demoskoff, a Son of God, a Daughter of Freedom, a rebel and a friend of rebels—in her remaining days a true one man revolution."

Dorothy Day has many causes to defend, all of them closely connected and interwoven: peace and the works of mercy, community life and the Green Revolution, the brotherhood of men in all societies and nationalities, and civil disobedience wherever the infringement of "mother state" is felt. She has told her story and that of Peter Maurin in *The Long Loneliness* and *Loaves and Fishes* and still tells it as it continues to develop and is noted in her "pilgrimages." Ammon has told of her and of his years at the Catholic Worker in his autobiographies. The chapter in *The One Man Revolution* has many references to these books, previously published, as well as many personal reminiscences. Dorothy has also often written about him, and her last tribute to him was written soon after she had attended his funeral in Salt Lake City. There is not much that can be added to what she said of him and of their cooperation, when they agreed as well as when they disagreed, always remaining congenial in all that is essential.

This reviewer remembers Ammon well at the time he was at Chrystie Street or visited Peter Maurin Farm on Staten Island to give talks in the grove. She remembers him selling papers at the gates of Fordham University, and standing up as his own witness at his trials after his arrests for protesting with Dorothy against civil defense. Speaking of others in *The One Man Revolution*, this one man radical fighter himself comes very much alive again.

Bread Not Bombs

(Continued from page 1)

graphed us, and decided to charge us with disorderly conduct (a violation) and obstructing governmental procedure (a class A misdemeanor). They didn't consider us very dangerous, not even bothering to supervise us in the street while they decided how to take us to the Tombs where we were quickly arraigned. Tom Cornell had retained a lawyer from the American Civil Liberties Union to represent us, and three of us were released on our recognizance. Bill Dorfer and Steve Kurzyna, who is only sixteen, were held on a fifty-dollar cash bond, because they faced charges from a sit-in at Varick Street in June. Bill refused bail out of conviction and a desire to use his time in the Tombs for repentance. It took us four hours to bail out Steve, who was immediately transferred to Rikers Island, since he was a minor. Bill let us bail him out after a hearing on Wednesday so he could participate in other actions.

Our vigil continued for the next three days with some people arriving and some people going, up to thirty during the days and up to fifteen sleeping out at night, even during a rainstorm. On Wednesday, a Selective Service employee came up to Tom and told him that he was resigning his position because of our vigil and wanted to throw down his own leaflets during the liturgy. Plans were also made for another action during the liturgy, spilling blood on the steps of Varick Street to symbolize the blood shed in Hiroshima and Vietnam.

Father Don Cooney came from Philadelphia for the liturgy, a simple responsive reading followed by a celebration of the Eucharist. During the liturgy, Bill Dorfer, Paul Frazier, and Ken Curtin, a red-haired young man whose father had been a policeman for twenty-eight years, each threw a gallon of steer blood on the street and were immediately arrested. Then from three or four windows in the building people making the "V" sign threw down leaflets, printed at government expense and numbered from government machines, which read, "1970 Years: How Long Must I Weep?" Centered on the page was of drawing of Jesus weeping with a crown of thorns. About twenty-five other employees also threw down signed cards reading, "Gold, Frankincense, Myrrh." In order to prevent the employees who had supported us from getting into trouble, we picked up the cards and leaflets all around the block.

We then gathered at 100 Centre Street to wait for the arraignment of our three brothers at Night Court who were charged with creating a health hazard (a class A misdemeanor) and disorderly conduct. While waiting for the arraignment, the arresting officer told us that they had had to consult the Police Department's legal section to decide what Bill and Paul and Ken would be charged with. "We could have charged them with four or five other things, but. . ." The officer assured us that none of the charges would stick anyway. Before the arraignment, the D.A. tried to make a deal with our attorney that the charges would be dropped if we cleaned up the blood. We couldn't go along with that and furthermore, we had chosen blood with anti-coagulant in it so that it would remain on the streets as a constant reminder to the employees of our protest and our presence. Our lawyer argued well and the three were released on their own recognizance.

It's hard to describe how happy we were about that. The twenty-four of us who were waiting in court streamed out of the room to greet them, some saying "Power to the Pope," eating the last of the bread and passing around a bottle of wine Tom had bought. The vigil was over but our work wasn't, we had court appearances and future actions ahead of us. We did not end the war, we had not atoned for Hiroshima, but we had influenced some people and given others something to think about. We had done something small, but we had done it peacefully and, in doing it, we had rededicated ourselves and given witness to the fact that nonviolence works. Slowly but effectively.

The Farm Workers

(Continued from page 7)

sing the dire need of a farm workers' clinic. She also spoke on the danger of pesticides to health and welfare in agriculture.

Robert McMillen, one of our lawyers, has been our legislative watchdog in Sacramento. Father Joe Melton assisted us in Delano and in Coachella Valley for several months. Doug Adair, former EL MALCRIADO editor, is on the Philadelphia boycott; and Father Victor Saladini, who was arrested for trespassing in Borrego Springs while picketing, now is working in the New York boycott after assignments in Montreal.

Putting It Together

I might have erred in aligning names with certain groups, thus dubbing one for the other. But the general effect still remains the same. It's just like pulling out a dollar from one pocket and slipping it into the other. My point is that those people mentioned above have made significant contributions in building the union even though they weren't farm workers.

The farm workers' right to organize and bargain collectively is a dead issue. It was replaced by the "boycott" splitting most intimate friends, families, communities, churches, the country and the world. The Catholic Church wasn't immune to the contagious and dramatic discussions of the new issue. Out of painful deliberations was fired a correction shot re-directing the Faith to its original course of intent and commitment to the helpless poor. The results were gratifying and radiate brilliant lights of hope for more victories for mankind.

In the Bay Area, around 800 priests were asked to support and be involved in the grape boycott. U.S. priests and laymen, numbering 35,000, passed a resolution endorsing the boycott. Many priests and nuns visited Delano incognito. If they didn't completely hide their true identity in slacks, plain shirts, blouses, and sweaters, then they would tell me who they were. All were enthusiatically for the "Huelga" and the "Cause."

From the National Conference of Catholic Bishops was the "Committee of Bishops." Auxiliary Bishop Joseph F. Donnelly was chairman; Archbishop Timothy Manning, Bishop Hugh A. Donohoe, Bishop Walter J. Curtis and Bishop Humberto S. Medeiros, members. Monsignors Roger Mahony, Director of Catholic Charities, and George G. Higgins, Director of the Department of Urban Life, were with the mediating Bishops Committee. Working with them was the Reverend Lloyd Saatjian, a Protestant minister from Palm Springs. He was soft-spoken with a pleasant, understanding personality.

With this combination of mediators, the first table grape contract was signed between the Lionel Steinburg and David Freedman Company and the union. At the press conference in Los Angeles, Steinburg said, "I am a Jew and this is the first time that I am being baptized by a Protestant minister and the Catholic bishops. I believe this marks the beginning of mutual understanding between the industry (agriculture) and the union for the benefits of both parties."

The signing of the contract between Steinburg and the union was truly a breakthrough and a historic landmark in the negotiation for table grapes. In a very short time since then, the union has signed over 70 contracts from a 15-acre family farm to a giant Tenneco Agribusiness whose assets in land area aggregate to 1,762,000 acres. Hundreds of farm workers flocked in, and still do, to the protective fold of the farm workers' union—many more than we'd won during the past five years.

The mediators approached the problem in the most simple and practical way. Industry and union have their peculiar needs to survive. The solution was always found in a compromise balancing the risks and benefits between the two parties.

The Catholic Church, through the Bishops Committee, in conjunction with the Protestant denominations, gave its true spirit and love for a new life that were dormant for centuries. Under the farm workers' movement (following the courageous leadership of Cesar Chavez), the Delano grape pickers asked for a just share in the multi-billion dollar harvest in U.S. agriculture for all farm workers. This is the goal of the struggle. It's moral because it's right. But the essence of the Movement goes far beyond the horizon. It proposes to liberate the human spirit for the enjoyment of life to the fullest extent.

Hope's Enterprise

(Continued from Page 3)

than that, for they form a pattern of a particular kind. I mean that they are the **type** of truly functional decentralized responsibility. They are libertarian and sensitive. They are political in the fundamental (to me, most valid) sense that the organized activity exists exclusively, and visibly, for the purpose of meeting common needs. All this, certainly, is writ small, yet it can be classed among the impulses that keep alive the idea of non-violent social revolution.

That's my long-range interest, and I do certainly urge it on others. It may be, however, that the short, that is immediate, view is far more compelling. The neighborhood is a meat-grinder. We know that heroin is being pushed in the public school. We know—and this is the newest development—that neighborhood addicts are recruiting twelve and thirteen year old kids into robbery gangs. The police know too, and are nearly useless. Nor has anyone failed to observe that the chief products of the public school are ignorance, apathy, and collapse of self. All this is what **Cuando** is contending with. On the one hand, they're snowed under. On the other hand, their achievments are impressive. (Which is how things are those days.)

I find it impressive:

1) that **Cuando** exists;

2) that for more than a year they have conducted an after-school storefront Children's Center, staffed by volunteers and paid for out of their own pockets;

3) that for more than two years they have conducted athletic programs and weekend outings (Frank Baez, Melvin Cadiz, Daniel Torres);

4) that they have conducted a successful voter registration drive (David Munoz);

5) that they have initiated clean-up campaigns; have cleared a vacant lot for play; have collaborated with an architect on the design of a mini-park, and are trying to bring it into existence (John Corsale); have agitated (and are) for playground lights, for landlord and NYC responsibility, and for some form of official and community response to the drug problem;

6) that they have held one very successful block festival, and are trying to make it an annual event;

7) that they have formed a school, have recruited students, and have been able to inspire three teachers to take on exhausting responsibilities.

The expenses and labors of **Cuando** have been borne by the members themselves, all of whom work hard for a living . . .

Obviously, there is a spirit here that touches others. Perhaps it can be proposed as a model of hope, 1970 style, i.e., the enterprise looks impossible, it won't divert our larger rush to disaster, all powers (including the unions) are either by policy set against it or profoundly indifferent, **and yet** one is moved (even excited) in the presence of **Cuando:** their endeavor is admirable, their people cheerful, practical, and good, their example invaluable, their labor productive. Hope, then, is this: that under the enduring condition of expecting nothing, one is heartened by the creation of positive good.

Cuando is approaching Foundations for long-term (one year! two years!) support. In the meantime, the teachers (and children too, since lunches are provided) must eat, materials must be purchased, trips must be paid for, more children must be reached.

I know that everyone who reads this letter receives, every week, dozens of urgent and truly important pleas for help. I don't know what to say about this, except here's another. I needn't stress that it's urgent. I do want to stress, however, that **Cuando** is unique. Its concerns are the basic functions of social life. It is a life-support organization—for which reason its claims on our assistance are of the clearest and most legitimate kind.

Cuando is tax exempt. Cuando, Inc., 39 E. First St., N.Y.C., 10003.

A Farm With A View

(Continued from page 2)

spoke about Erikson, presenting a scholarly but interesting account of Erikson's psychological development and background. Workshops held during the morning and afternoon hours analyzed various aspects of the new man. Saturday night a Mass was concelebrated by several priests, with the Gospel read by a Lutheran minister. Later that night a witnessing session was held, in which those participating shared experiences and insights.

The last talk of the Pax conference was that of Dorothy Day, who spoke on THE NEW MAN AND THE CHRISTIAN TRADITION. This new man, of whom St. Paul speaks, who is truly reborn in Christ, is characterized by love of holy poverty, love of God, love of neighbor, and dedicated service of others for the love of God, is truly peaceful, truly humble. It is this new man whom we are enjoined to become. Most of us are very imperfect instruments and have gone such a little way on the path of becoming Christian that only God Himself could measure our minuscule progress. But there are others who can serve as exemplars. Among those Dorothy cited are: Peter Maurin, founder of the Catholic Worker, a truly dedicated man of great humility and love of poverty; Ammon Hennacy, Cesar Chavez, Martin Luther King, and Ralph Abernathy. Dorothy also reaffirmed her faith in non-violence, and used Cesar Chavez' recent victory against the powerful growers of California as evidence that non-violence does work. In this age of frequent bomb scares and terrorist attacks, it is terribly important to hold on to this faith, this hope in the Christian non-violent way.

On August twenty-second a conference on ecology was held here at the farm. Lauren Surget, who does experimental and research work for the Bell Telephone Laboratories, spoke on the grave and almost immediate hazards of environmental pollution, and spoke of his own hope that man—again, the new man, the truly transformed man—might survive solely by reason of his transformation, a transformation which Lauren felt had already begun. Following a discussion period, Clarice Danielson gave a good report on Robert Ardrey's provocative and fascinating book THE TERRITORIAL IMPERATIVE. Clarice enlivened her account with several dramatic stories of animals behaving in truly cooperative, non-competitive ways, or through ritualized patterns of behavior giving harmless outlet to aggressions without inflicting death on another member of the species. If man were a little more humble, he might learn a few lessons from animals, who are far less destructive of their own kind, far more regardful of the web of life, the interdependence of all forms of living and non-living matter.

On the night following the ecology talks, some slides illustrating the dangers of specific insecticides and pesticides were shown. A group from Philadelphia, including our friend and co-editor, Charles Butterworth, attended this conference.

On the Sunday of our ecology weekend, Father Jude Mili who now lives in West Virginia, came for a visit and said a beautiful Mass in our living room.

Discussions during these torrid weeks of summer, when we have such an influx of company, have hardly been limited to formal occasions. There have been times when discussions in our living room or dining room became so perfervid and vociferous that those of us who are older and have reached a preference for quiet, flee to our rooms and barricade ourselves behind whatever sound-proofing we can find. But the young people talk on. For that is the way of the young. Even so, sometimes they may attain clarification of thought.

Now that summer is ending, we do not intend to give up all discussion. Helene Iswolsky and Kay Lynch have been planning third-Sunday-of-the-month discussions for the coming months. The first of such third Sunday afternoons will begin in October. On this occasion Walter and Miriam Jarsky, who live in our community but who spent the summer visiting Miriam's parents in Europe, will speak on certain European communities where they also visited.

What with visiting children and visiting dogs, discussions are not the only hubbub about the place, a fact which some of our numerous cats have remarked with catty acerbity. Visiting dogs aside, however, our dog population is growing, and if they cannot overtake, will at least annoy the cats. Now that the Jarskys are back with their Blondie, we have three dogs living with us. The latest canine addition is a leggy coon hound pup which was given Johnny Hughes early in the summer. Named Grapes because her markings supposedly resemble grapes, she is a charming, affectionate pup, though some nights she may be heard baying at the moon. But who knows, perhaps she has really treed a raccoon, which would please John Filliger, since raccoons are too fond of his corn.

As always, there are many persons doing many tasks to keep things going hereabouts. Stanley Vishnewski began the day by going for the mail, then tackled some correspondence. Elaine La Pointe and Larry Evers cleaned the living room this morning. Mike Sullivan spent part of the day repairing the windows in Father Jack English's room. But Dominick Falso, who on another occasion prepared a most delectable Italian meal for us, cooked for our supper a superb minestrone. Young people come and go, sometimes working, sometimes talking, sometimes strumming guitars and singing. But Susan Pollock appears ever and anon, and always thereafter there is yogurt for our health and enjoyment. To all who do the major tasks and all who do the minor, we say a major "thank you."

The arts continue to thrive among us. Joe Geraci writes every morning. Rita Corbin continues to design her beautiful cards. Emily Coleman has suspended painting for the moment but will, I think, resume soon. Marge Hughes has learned to play the autoharp beautifully. Audrey Monroe—Joe and Audrey are visiting us this week—is taking up the same instrument, and she and Marge will soon be playing duets.

To all curious readers and all critics: we are no Utopia, but imperfect instruments who fail many times over. We have our problems, our difficulties, our personality clashes, even our lunatic fringe, which is sometimes hard to detect and harder to suffer. The beauty of our fields and woods is marred in places by the decaying hulks of old jalopies and other debris of our consumer civilization. Our poison ivy grows ranker than our flowers. But still we share some beauty, some prayer, some suffering, and much need, and so are bound together.

Last night we felt bound together as Peggy Conklin was carried out on a stretcher to the waiting ambulance. Peggy had fallen into a state of unconsciousness almost like death, but Daniel, Elaine, Marge, and Father Andy revived her before the ambulance arrived. Now today in the hospital, Peggy is better, and we hope will soon be home again.

We are glad that Father Jack English is with us now and able to spend much time with Peggy, for they are old friends, and Peggy sets much store by Father Jack. Father Jack himself is still recovering from a serious coronary which he suffered earlier in the summer.

Katydids and crickets sing on a night in early September. The rain has stopped, but the moist pungence begins to smell of fall. We move toward October, toward the great Feast of St. Francis. St. Francis of Assissi, pray for us and for all our Brother Creatures.

The Farm Migrant: No Escape From Peonage

By DR. RAYMOND M. WHEELER

(Editor's Note: Dr. Wheeler, a Charlotte, N.Y., physician, was a member of a team of doctors studying the problems of migratory workers in the South, particularly Florida and Texas. Following are excerpts from his testimony before the Senate Migratory Labor Subcommittee).

WE SAW countless families with large numbers of children, isolated from the mainstream of American culture and opportunity, possessing none of the protections of life and job and health which other Americans take for granted as rights of citizenship.

If the farmworker is injured in the field or if he becomes ill from exposure to pesticides (we heard of and saw many instances of both situations), he does not receive Workman's Compensation. If he is sick or cannot find work (and there are many days when work is not available) he does not receive unemployment insurance.

There is no realistic minimum wage to guarantee him adequate pay for his work. If Social Security payments are deducted from his wages, few records are kept by the crew boss on which he can later base a claim. He has no health or hospital insurance to provide him with minimal medical care and he does not earn enough to purchase it.

The farmer is not even prohibited from working young children in the fields if the parents, desperate for enough money to buy food and shelter, choose to take their children out of school or bring along their pre-school age children to pick the vegetables.

WE SAW housing and living conditions horrible and dehumanizing to the point of our disbelief. In Florida and in Texas, we visited housing projects, built with public funds, which defy description. We saw living quarters constructed as long cinder-block or wooden sheds, divided into single rooms by walls which do not reach to the ceilings.

Without heat, adequate light or ventilation, and containing no plumbing or refrigeration, each room (no larger than 8 x 14 feet) is the living space of an entire family appropriately suggesting slave quarters of earlier days.

Can you imagine the effects on a child living in such a situation — the physical discomfort of the heat, the cold, the dampness? The absence of fresh air and the crowding greatly increases the likelihood of transmission of contagious disease. This is why so many have tuberculosis as well as chronic respiratory infections . . .

The Harvesters

IN ALL of the areas we visited, the nearly total lack of even minimally adequate medical care and health services was an early and easily documented observation . . .

A few statistics substantiate our observation. The migrant has a life expectancy 20 years less than the average American. His infant and maternal mortality is 125 percent higher than the national average. The death rate from influenza and pneumonia is 200 percent higher than the national rate, and from tuberculosis, 250 percent higher than the national rate. The accident rate among migrant farmworkers is 300 percent above the national rate . . .

High blood pressure, diabetes, urinary tract infections, anemia, tuberculosis, gallbladder and intestinal disorders, eye and skin diseases were frequent findings among the adults.

Almost without exception, intestinal parasites were found in the stool specimens examined. Most of the children had chronic skin infections. Chronically infected draining ears with resulting partial deafness occurred in an amazing number of the smaller children. We saw rickets, a disorder thought to be nearly abolished in this country, and every form of vitamin deficiency known to us that could be identified by clinical examination was reported.

I doubt that any group of physicians in the past 30 years has seen, in this country, as many malnourished children assembled in one place as we saw in Hidalgo County, Texas . . .

IN FLORIDA and Texas, the farm worker remains a valuable asset to the owners and operators of the huge farms which produce food and fruit for the nation. Without them, corn and tomatoes would rot in the fields and oranges and grapefruit would shrivel on the trees.

There is no way that these farms can be operated without the migrant work force which moves about the area, harvesting the beans and squash this week, moving on to gather the avocadoes another week, in another county. Mechanization has not yet devised a way to replace them.

What is different in Florida and Texas from the rest of the rural South is the deliberate, cruelly contrived, and highly effective system which has been devised to extract the maximum work and productivity from other human beings for the cheapest possible price.

Every effort is directed toward isolating the farmworker from the rest of society, maintaining him at the lowest level of subsistence which he will tolerate — then making certain that he has no means of escape from a system that holds him in virtual peonage. And to that end, the grower has the full cooperation of the Federal government, the state, and the local community.

Farm Workers Church

The Farm Workers And The Church

By PHILIP VERA CRUZ

Before the grape strike started in September, 1965, about 95 per cent of the Filipinos and Mexicans in the Delano area were Catholics. They would go, and still do, to St. Mary's and Guadalupe Churches: each church conveniently located for the growers and the farm workers.

The Slavonian, Italian, Irish, and other Catholic growers attend St. Mary's Church to pray for more bountiful harvests and profits, for the expansion of their ranches. They believed God favored their prayers because in a few short years many of these farmers became millionaires. Filipinos and Mexicans also go to Mass at St. Mary's. Like other good Catholics, they go to Church for moral and spiritual inspiration.

However, several foremen, contractors, bar and cardroom operators discovered it was profitable to rub shoulders with the powerful people in town. In fair weather, the growers sometimes discuss their labor problems outside the Church door. When a contractor stops by, the growers ask for his expert advice on the quality of the labor supply. By instinct and experience he knows that some groups of workers yield more profit than other workers when given board.

With unquestioned authority the contractor would reply, "The wetbacks and green carders are much better than the local workers."

Then he would explain that "they (wetbacks and green-carders) work harder because they are afraid to be fired. They have no place to go and nothing to eat."

"That is very true," a grower remarked. "My boys are kind of mixed up—I mean local, green-card, and wetback workers. They like drinking, card games, and cockfights. All are broke. Once in a great while one might complain. I tell him to like it or leave. But he has no money nor any other place to stay. Nobody dares to open his big mouth again."

"But it's against the law," objected a more decent grower. "I don't want my labor camp raided. Those boys worked hard for their money. When caught they are jailed and fined. That's not right."

Irritated, a big rancher answered, "The hell with the law! Those stupid fools don't know any better. But they have the right to use their money the way they want. Because they have nothing, they work harder and stay longer on the job. They have no choice left. But if you make money in business, you are right; on the contrary, wrong. Worry about your business but not the workers. Justice is the eternal hope of the wretched souls. It's just a beautiful dream that will never be realized."

Most of the farm workers went to Guadalupe Church. They were poor, but more sincere and honest in their religious belief. There was no thought of gaining any material advantage over their fellowmen. The priest liked to see them all in the Mass, but he was scared to look at their "Huelga" buttons on their lapels.

The Bishop in Fresno favored the rich growers. His action was in accord with the anti-union priests in Delano. The old man was retired not because of his mistaken judgment but of his age. His successor, Bishop Manning, visited Delano with expressed "concern" and therefore, "to listen to your problems with the growers." Bishop

Interview With Cesar Chavez

The morning following his release, Cesar was interviewed at his home by El Malcriado. The following are Cesar's recollections of his 20-day stay in jail.

EL MALCRIADO—How do you feel after going to jail for civil disobedience?

CESAR—Well, it was partially civil disobedience. It wasn't a real classic case of civil disobedience. I was sentenced to an indefinite period. So I couldn't look forward to a year or two; I didn't know what was going to happen. Really what the judge was saying is that it is up to me to get out of jail if I called off the boycott. That put the responsibility on me to say: No, I'll never call it off. It wasn't the classic civil disobedience case but it was a very good case. It was hard but now that it's over, I feel elated.

EL MALCRIADO—What was your relationship with the other inmates?

CESAR—I made a lot of friends, inside with the inmates, did a little organizing and spread the word around quite a bit. I wasn't too successful in convincing anybody about non-violence inside, but they are all with us. This includes blacks, whites and chicanos. The saddest thing is that the people who are in jail by and large are poor people. Only poor people go to jail and stay there. Also men who don't have anyone on the outside who really cares for them. Or who have someone on the outside who cannot really help them. It's very, very sad. Mostly young people. The routine . . . they put them in jail, they book them. Then they bring them into court and have the hearing and bring them back. It's like a completely different world. I couldn't help feeling sorry for them. At least I had something on the outside going for me and I had the conviction of the cause. But they don't have any of those things. I learned that there is a very serious problem on the whole question of parole. Parole, I think, is a damaging, unconstitutional and damning thing for people. It gets a guy, puts him on parole, and they'll never let him go.

EL MALCRIADO—Did those on the vigil keep you company?

CESAR—Yeah, I never felt alone. For one thing at night I could hear their singing. I heard the mananitas. Oh great! I was asleep you know. They started singing and the jailer opened the front door. I heard this rapping on the bulkhead "Wake up . . . They're singing!" Then I heard the chicanos in the jail gritando (yelling) you know. "Eran las mananaitas," about the second verse and ool, you know how they feel really good. So I just opened my pillow and blanket. It's the first time they gave me mananitas, you know. Well, they were for the Virgin and the chicanos were all over the jail. Four-thirty in the morning gritando, you know, gritos de la raza, all over. It was really great. The poor guys on the vigil sacrificed more than I did. See the determination? The growers said they were going to do the same thing. They lasted a day. But the people were really beautiful. The visitors were a tremendous support. I talked to about 150 the 1st Saturday and about 300 the 2nd Saturday. I talked to a lot of women, really very sincere. It gives you a tremendous feeling. I was very happy that Coretta King, Ethel Kennedy and Bishop Flores came. They did a lot of good for me spiritually and an awful lot of good to the people.

EL MALCRIADO—What did you think of our opposition's violence during Ethel Kennedy's visit?

CESAR—It's a clear example exactly how violence, whoever does it, really hurts their cause. Those guys really

EASY ESSAYS

By PETER MAURIN (1877-1949)

INDOCTRINATION

In Houses of Hospitality
unemployed college graduates
will be fed, clothed, sheltered,
as well as indoctrinated.
Unemployed college graduates
must be told
why things are
what they are,
how things would be
if they were
as they should be
and how a path
can be made
from the things
as they are
to the things
as they should be.
Unemployed college graduates
must be told
how to create
a new society
within the shell of the old
with the philosophy of the new,
which is not a new philosophy,
but a very old philosophy,
a philosophy so old
that it looks like new.

ON FARMING COMMUNES

When unemployed college graduates
will have been indoctrinated
they will be moved
to Farming Communes.
On Farming Communes
unemployed college graduates
will be taught
how to build their houses,
how to gather their fuel,
how to raise their food,
how to make their furniture;
that is to say,
how to employ themselves.
Unemployed college graduates
must be taught
how to use their hands.
And while time is on the hands
of college graduates
their heads don't function
as they should function.
On Farming Communes
unemployed college graduates
will learn to use
both their hands
and their heads.

FIVE DEFINITIONS

A Bourgeois
is a fellow
who tries to be somebody
by trying to be
like everybody,
which makes him
a nobody.
A Dictator
is a fellow
who does not hesitate
to strike you over the head
if you refuse to do
what he wants you to do.
A Leader
is a fellow
who refuses to be crazy
the way everybody else is crazy
and tries to be crazy
in his own crazy way.
A Bolshevist
is a fellow
who tries to get
what the other fellow has
and to regulate
what you should have.
A Communitarian
is a fellow
who refuses to be
what the other fellow is
and tries to be
what he wants him to be.

THEY and WE

People say:
"They don't do this,
they don't do that,
they ought to do this,
they ought to do that."
Always "They"
and never "I."
People should say:
"They are crazy
for doing this
and not doing that
but I don't need
to be crazy
the way they are crazy."
The Communitarian Revolution
is basically
a personal revolution.
It starts with I,
not with They.
One I plus one I
makes two I's
and two I's make We,
We is a community,
while "they" is a crowd.

BOOKS AND PAMPHLETS ON NON-VIOLENCE NEEDED

The United Farm Workers, O.C., Stockton Area Office (covering San Joaquin and Stanislaus Counties, California) is setting up a department of non-violence. The director of the Stockton Area Office is Andy Imutan, Vice President of the United Farm Workers, O.C. Future plans include training courses in non-violence and a library on non-violence. Readers of the Catholic Worker and members of all groups are asked to donate books or material on non-violence or to send names and publishers of relevant books to:

Crossing India

By EILEEN EGAN

This is the third of four articles on the visit to India made by Dorothy Day and Eileen Egan in the course of a round-the-world peace pilgrimage made possible by the invitation to Australia by the Rev. Roger Pryke, editor of NONVIOLENT POWER.

Underneath us, the River Hooghly, choking with silt, moved sluggishly in a barely perceptible tide. Around us, on the Howrah Bridge leading from central Calcutta to the Howrah Railway Station, we felt the inexorable onrush of a tide of human beings. They were crossing the bridge on foot, padding their sandalled way by the tens of thousands to their homes on the west bank of the Hooghly. It was the end of a work day for these numberless marchers, mostly men, whose long white tunics and flowing dhotis gave the effect of an assemblage of hurrying ghosts. It was the end of our stay in Calcutta for Dorothy Day and me. Our path led Northwest to New Delhi.

Mother Teresa of the Missionaries of Charity, who had met us at Dum Dum Airport on our arrival, took us to the station in the ambulance. It was the ambulance that carried doctors, food and medicaments to the communities of lepers in and around Calcutta, and that also brought the dying to the Kalighat Hostel. Twilight had merged into darkness by the time the slow-moving traffic had reached the other side of the bridge. To me, it was a wonder that we had made as good time as we had at a peak traffic hour. Howrah Bridge, already nearly a century old, is the one bridge over the Hooghly, a river cutting through a city of between 7,000,000 and 9,000,000 souls.

As we walked toward the station, men old and young fastened burning eyes on us and plucked at us with arms thin as twigs. Inside the station, there seemed to be no beggars or homeless people squatting in corners. During my earlier visits Howrah had given shelter to an untold number of the homeless, some of whom had come to die at Kalighat.

A short muscular man approached Mother Teresa. He was wearing a dark red tunic, or kurta, over a dhoti. His dark eyes lit up with delight as he chatted with Mother Teresa. He took off a dirty cotton scarf, carefully wound it in a circle on top of his head, and hoisted our two suitcases on his head.

"That man seems to know you, Mother. Do you know him?" I asked.

"Oh, yes. Ashokri is a good man. He works hard for his family."

We were standing in the center of a platform packed so tight with people that the hawkers of fruits, snacks or newspapers had to push their way through the massed bodies. They screamed out their wares in shrill cries that hardly carried above the noise of arriving trains, the announcements on the raucous loudspeaker and the din of hundreds of conversations. We had over an hour to wait for our train, so we started to talk to Ashokri. To our surprise, he knew some English. He was not a Bengali, having migrated from a place called Chapra in Bihar.

"I have my matric," he told us. A matriculation certificate is the equivalent of a high school diploma. With Mother Teresa helping, he explained that after coming to Calcutta from Bihar, the only work he could get was as a Howrah porter.

"I have three children," he said. And then he smiled. "They are students. All three of them. My eldest boy is in the tenth class, the middle one is in the

ON PILGRIMAGE

By DOROTHY DAY

Underneath a picture of Angela Davis which appeared in the "Daily World" a few weeks ago, there was a caption, "All generations shall call her blessed." To continue to quote scripture, she has been "counted worthy to suffer dishonor" for justice sake. Angela Davis is a Communist, in this case and it is a name for vilification nowadays, though the early Christians, working for the common good became communists in a very literal sense. "Property, the more common it becomes, the more holy it becomes," St. Gertrude said in the middle ages.

That quotation from the Magnificat used by the Communist daily, reminded me of the Scottsboro case during the depression, when we were all fighting the death sentences of nine black youths in the South. I used the headline on the front page of **The Catholic Worker** "The Scottsboro Boys are the Children of Mary," which is the name of a pious association for youth in the Catholic Church. This caused great controversy among our readers although I explained in the body of the text that they should read in John's Gospel how Jesus from the Cross, called out to Mary, his mother, "Behold thy son," and to the apostle John, "Behold thy mother." The Gospel account continues, "and from that time, the apostle took her for his own." So we are all children of Mary.

Certainly in the light of this teaching, since Christ is our brother, Angela Davis is our sister, and we love and esteem her as such. We cannot and must not prejudge her case any more than we can the case against Fathers Phil and Dan Berrigan.

Angela Davis is a beautiful young woman, a graduate of Brandeis University, and at a time when jobs even in the academic field were scarce, risked her livelihood by openly stating her faith in the kind of social order which she thought would bring justice and a better life for her black brothers and sisters. We all know the flagrant discrimination which keeps the black in the slums, the first to be fired, the last to be hired; unable to achieve the status of college students and so the first to be drafted for the ever extending war in Southeast Asia where our mad violence has laid waste the land and slaughtered its people. And then we decry the violence of a class conflict. Father Daniel Lord, the Jesuit once pointed out the main objections to the Communists. They wanted to do away with private property, they instigated class war, they denied God. And I could always point out looking around me at the homelessness of the destitute, the ever worsening slums, the expropriation of small homes for highways and other public projects, including luxury housing—that we Americans are the most flagrant deniers of private property for the masses. And as for war used as a means to subdue our enemies, we have glorified it and continue to try to glorify it as a holy crusade against Communism; as for denying God, how often do we deny Christ in our destitute brothers, or in those of a different color, race or creed?

According to our boast as Americans we consider everyone innocent until he is proved guilty—or we are supposed to. And what a travesty we see. From the time a man or woman is arrested he is treated by judge, and court and jail attendants as though he were guilty. The very heavy bail prejudges him guilty and liable to jump bail at the first opportunity. The poor are judged because they are poor and since they cannot raise even a fifty or hundred dollar bail bond, they are kept for long months awaiting trial.

Last winter, Sister Donald Corcoran, a Benedictine nun from Minnesota who was working with us went out during the Christmas season in snow and sleet and picketed and kept vigil one night at the Woman's House of Detention, where Angela was being held for the months while her lawyers tried to prevent her extradition to southern California, where the case is prejudged and by its very presence an incitement to violence on the part of the police. Of course there is many another incitement; poverty, injustice, unemployment and discrimination, are already incitements to violence. I should not say "poverty." I should say **destitution** which is what the "poor" American suffers today, ninety-nine per cent of them, whether they are Afro-American, Mexican-American, Puerto Rican, Filipino, Indian or any other shade of color. Or just poor white.

Angela Davis is already judged because she admits she is a communist. She was also a teacher of philosophy at a California university and losing her job because she was a communist.

And yet today Catholics can boast that the Vatican has started an Institute of Marxist Studies. It makes me want, though it is rather late to do so, to enroll in the Marxist school here in New York. Of course we should all study Marxism, instead of thinking always of the dangers of such knowledge of a philosophy and economic theory which has dominated today the thinking of much of the world.

Black Studies

I was looking back today in the Catholic Worker past, thinking of how much we had to do with the situation of blacks, how much contact we had with them. From the very first issue in 1933 we have covered the story of discrimination as to jobs.

We were living then in an Italian, German and Irish neighborhood, so there was no close contact in New-York. But as Houses of Hospitality began opening up, we had houses in Houma, Louisiana, Memphis, Tennessee, and Baltimore. The Baltimore House was crowded with blacks coming up from the south looking for jobs. They filled

Tivoli: a Farm With a View

By DEANE MARY MOWRER

Now on the brink of February, the early afternoon sun shines warm on the new-fallen snow covering the slippery surface of January's accumulated ice and snow. Clare Danielsson and I, lured by the sun to take holiday from the monotonous winter confinement of the house (Clare, who teaches, gets out regularly, but even teachers enjoy the pleasure and freedom of a Saturday walk) made our way cautiously along the narrow snow-banked path towards the pig and chicken quarters.

The pig, drunk with sunshine perhaps, greeted us with exuberant grunts and cavorted about his enclosure with a porcine nimbleness that might have aroused admiration in a goat. The chickens were snug inside their house, but as we approached we heard the hens singing with their accustomed sweetness.

Then, hearing our voices, the rooster crowed for us. "Where is Spring," he seemed to say, "Where is Spring." The dried brown leaves, still hanging on a nearby oak, made another kind of music as a winter breeze set them rustling.

And "Grapes", Johnny Hughes' coon hound—grown longer now, leaner, taller—so wrapped herself about me that I thought for a moment she was two dogs rather than one.

Then dog and pig and chickens, Clare and I murmured a peaceful wintry paean to the sun, the bringer of warmth, the promise of Spring.

Today, February first, the arctic air mass, which began moving into our area yesterday and brought our temperatures to sub-zero levels last night and early this morning, has kept me indoors warming my wintry mood with the memory of a meditative moment in the sun.

A casual comment on the radio caught my attention, as I twisted the dial in quest of a better weather forecast. February, the unknown commentator said, is derived from a word which meant *to purify*. And as most Catholics know, February is the month when we celebrate the great Feast of the Purification of Our Lady. That Feast we will keep tomorrow, the second of February.

Lent, too, usually begins some time in February—this year Ash Wednesday falls on February twenty-fourth—and this is certainly a period of purification, as are the preparatory weeks between Candlemas and Ash Wednesday. What better month then, than February for us to begin to purify ourselves, to purify not only ourselves but also our environment, which we human beings have for so long despoiled and polluted?

Thinking with a kind of winter-weather gloom about the great problems of pollution which confront us—the problems of earth, air, water, human pollution, I thought of the walk David Wayfield and I took to the river yesterday afternoon, the last day of January, the Fourth Sunday after Epiphany.

The great Hudson River, which our farm with a view overlooks, is so much a part of our lives that many of us must, from time to time, make pilgrimages to its banks to inquire of its news, its tidal movements, its deep-channeled quest of the sea.

Snow in the growing cold crunched under our feet as we walked. In the woods nearby several bluejays set up a wild alarm of shrieks and activity. Somewhere not far away, starlings and sparrows gossiped about the scarcity of grain in the snow-covered fields.

But when we had crossed the tracks and stood overlooking the river, there seemed to be no sound at all. Not even the cracking of the ice on the river. Only the music of silence which is like the breathing of earth. We stood in snow, and the river was sheathed with snow-covered ice, but ice with a rough uneven surface with great blocks of ice overlapping each other, frozen in mid-leap.

Down underneath the ice, the water flowed, bearing its heavy burden of pollutants which we human beings have forced upon it, silently pursuing its ancient course to the sea. I was glad that the ice gave the river a temporary freedom from the great oil barges and tankers, which, when the ice breaks up, will once again make this river their roadway, polluting the air with noise and the water with oil.

The thought of the tankers reminded me of the great spillage of oil which has taken place along our coasts as the result of collisions and other accidents. I thought of the ecological damage resulting from off-shore drill-

By KATHLEEN DESUTTER

Perhaps winter reveals time's truest face. There are the holidays, sometimes holydays, when earth and heaven seem not so very far apart—for an instant masks can be removed, gifts and smiles exchanged, and the faces one has seen every single day appear suddenly beautiful. Between the freezing and the melting and the freezing again, a reminder: make of neither fire nor ice an idol. And in the quiet stillness of nights covered with snow, the silence itself can teach us once more how to "love the questions themselves."

For the questions, the questions sometimes come down hard. Mary Hughes' death early this month touched us all, even those who did not know her well, very deeply. And a few weeks later came more tradgedy, when Tony Biczewski was found dead in his apartment, apparently having suffered a fatal seizure. Friends will remember Tony's handsome, smiling Argentinean face, as well as the many good meals and times he was part of at the Worker. It is said that Rabbi Nachman, in order to persist in his struggling, thought every morning that only this one day was still left to him. May the memory of these and all our friends be strength for us to live.

Hospitality

The need for houses of hospitality is as great today as it has ever been; this we learn from William Stringfellow and Anthony Towne as well as from all the "ambassadors of God" who make a home at the Catholic Worker. The absence of and need for shelter for the poor and homeless become only too clear during the winter—trashcan fires and building hallways are ephemeral relief at best from this city's deadly cold. Genuine hospitality, like most important things, comes only at the cost of personal sacrifice. Higher taxes and patched-over welfare systems are neither causes of nor solutions to the fact that the rich grow richer while the poor remain poor. The "gentle revolution" toward a new society will surely come only as we care for one another daily, learn to know each other as brother and sister.

St. Joseph's House

An unusual "straightened up" look came over the Catholic Worker early this month, as all pitched in to make straight the paths to the fire escapes on each floor. As faithful as Arthur Lacey's teasing or Frank Donovan's smile (but not nearly so welcome), a serenic wailing of city fire trucks has become part of every night in this neighborhood over the past months, and it is impossible to be too cautious about fires in these buildings. One big task was the mailing of back issues of the paper to the dozen or more CW houses across the country. Louie, Brother John, Wong and Marcel work faithfully on the paper every day, with help from Charlie, Larry Burch, Julia, Mr. Anderson and others. At times I'm convinced, were we on the banks of the Mississippi rather than the Hudson, the entire second floor (distributing floor and office) would rise up, take afloat

THE FARMWORKERS' STRUGGLE

London, Joan and Henry Anderson. So Shall Ye Reap. New York, 1971: Thomas Y. Crowell Co. $6.95.

Starting in the 'fifties, urban Americans have been made increasingly aware of the plight of the farmworker, and the long struggle to establish a farmworkers' union to bargain with agribusiness. Much writing on the subject has been devoted to the personality of Cesar Chavez, or otherwise limited in scope to the present unionization drive and the conditions of poverty and discrimination against which the United Farm Workers Organizing Committee, AFL-CIO (UFWOC) is fighting. Joan London and Henry Anderson have made a beginning at placing the present leaders and issues in the context of the century-long contest between California farm owners and the poor, non-white workers who have for so long made fortunes for others and fed the rest of America.

They effectively explode the mythology of California agribusiness, which claims to qualify for benefits and subsidies given to small family farms, and give a truer picture of how the state's profitable agriculture was built up. The irrigation system itself was first developed with the skills of Chinese immigrants, who were put to work in the fields they had made valuable. Later came Japanese, Mexican, Filipino, and, most recently, white, Jamaican, East Indian and Arab workers.

From the early ethnic struggles of Chinese and Japanese, to the militant strikes led by Wobblies just before World War I and Communists in the depression, the people in "shoe string" farm communities reacted to bad pay, working conditions and housing by trying to negotiate collectively with their bosses for a better break. But they lacked strong, united leadership based in the different ethnic groups, and faced vicious attacks by vigilantes and "law enforcement" officials who helped the growers import scab labor to break strikes.

The 'fifties and early 'sixties saw a series of attempts to organize the farm workers by Catholic priests, the National Agricultural Workers' Union, and the AFL-CIO's Agricultural Workers' Organizing Committee. The complex story of these years' failures brings home two clear points:

(1) The big time AFL-CIO bureaucrats had little interest in the farm worker. Ernesto Galarza, a persistent organizer, recalled: "One time I was at a meeting with three or four of them. It was at one of these plush motels. It would be beneath their dignity to gather in a workingman's place. There they were, around the pool, overflowing their swimming trunks, wallowing around in the water for all the world like a bunch of great white whales. I felt like Captain Ahab making the discovery of his life! If I had had a harpoon handy, I would not like to be responsible for what might have happened."

(2) Local, state and federal agencies —even those which were supposed to help working people—were always on the side of the government. While the Nixon-Reagan-Murphy crew were the most obvious enemies of farm labor, the Democratic Party and President Kennedy's Department of Labor betrayed the movement as well.

The UFWOC of the late sixties succeeded where others failed with the leadership of Cesar Chavez and Larry Itliong, a Chicano (Mexican-American) and Filipino who had themselves worked and organized in the fields for many years. The new union is careful not to depend on support from government agencies, and instead to build a community base with services like a credit union, insurance, and a gas co-op. While support from the UAW and AFL-CIO came through in large amounts, UFWOC has had to fight Teamster bureaucrats who sign "sweetheart contracts" with growers who want an easy way out.

London and Anderson show the sharp contrast between the approach of UFWOC and that of the "labor fakers." Unfortunately, they also try to fit the farmworkers' movement into a quest for something they call the "American dream," as when they say the farmworkers want "only those things which the American economy has demonstrated it is quite capable of conferring upon other workers: reasonable wages, reasonable safety and other working conditions, reasonable fringe benefits, reasonable job security, and, underlying all, a reasonable voice in determining what is reasonable." But recent years have seen millions of "other workers" thrown out of work, applying for food stamps, and sold out by union bureaucrats, government officials, and bosses. At the peak of Vietnam war casualties, more Americans were being killed on the job than in Southeast Asia! The authors fail to link the oppression of farm workers to that of other workers, who during the 'fifties' faced the same attacks on leaders who stood up for the rank-and-file.

Similarly, not once is rascism mentioned, although we can only understand the farmworkers' movement as part of the movement of Chicanos, Blacks, American Indians and other minorities for self-determination and against white racism. As a result, no clear explanation is given of why it is that white small farmers, whose objective interests lie in organizing collectively against big agribusiness rather than opposing the union, remain antagonistic to the mostly non-white workers. Nor is there any mention of racism in the refusal of white government officials to respond to farm workers' pleas for proper enforcement against growers' illegal practices.

Instead, the authors emphasize the supposed "great capacity . . . for endurance" of the Mexican who "shrugged" and felt "it was out of one's own hands." When unionists ignore the orders of hostile police, it is chalked up to the "inspiration from Thoreauvian friends of the movement." This stereotype ignores the long history of uprisings and strikes of the Mexican people, exemplified in the Revolution of 1910-1918, in which **campesinos** seized land for themselves and defended it. U.S. farm workers did not have to wait for white liberals to show them how to resist orders of racist sheriffs and judges. There is a strong, uncritical emphasis throughout the book on the virtues of non-violent leadership—including two priests and a farmer who were quite unsuccessful —but very little description of the experience and activity of the masses of farm workers, who in the beginning voted to strike over the reservations of Cesar Chavez.

It is suggested that for UFWOC to succeed, important factors will be the support of organized labor and influential liberals like Robert Kennedy, and a legal climate such as existed under the Wagner Act in the late 'thirties. But London and Anderson ignore these factors, both of which were absent, in blaming the failure of unionization in the early 'thirties' on revolutionary leadership. Similarly, they claim "the IWW's goals would ultimately have repelled most farm workers, who seek only decent wages and working conditions, and a voice in setsing them, rather than any revolutionary changes in society."

All of this ignores the question of whether the Di Giorgios, Nixons and Rockefellers will give up a fair share of the nation's wealth while they still control the land and industries, and pull the strings of government. The "American dream" seems impossible in this system of capitalism, in which racism is used to "divide and conquer" working people, unionists are threatened with joblessness, and people get not what they deserve but what they can fight for and defend together. More and more people are coming to see that only "revolutionary changes" can give working people a real voice in their lives, and decent income and working conditions for all. A young Chicano grape picker put it best when he said, "Our problems won't really be solved until we ourselves control the farms."

Farmworkers Versus Pentagon

By KATHLEEN DESUTTER

Fort Hamilton

On Martin Luther King Day last month, over 200 supporters joined Cesar Chavez and local UFWOC organizers in a demonstration at Fort Hamilton (Brooklyn) to protest the Department of Defense's strike-breaking efforts against the lettuce boycott. Figures supplied by the Bureau of Labor Statistics indicate that the government has significantly favored the Bud Antle firm (which has refused to sign or negotiate contracts with the UFWOC) in its lettuce purchases for the armed forces. The figures released show that in fiscal 1969 (July) the Department of Defense purchased $840,000 worth of lettuce from Antle ranches; in fiscal 1970 (July) the figure for such was $730,000; but in the first three months alone of the present strike, these purchases have totaled $750,000. Percentage-wise, it amounted to 9.9 per cent in fiscal '69, 8.3 per cent in fiscal '70, and 29.1 per cent in the first quarter of fiscal '71, which is to say, the defense department has tripled its purchases of lettuce from Antle since the strike began.

Consequently protests at military bases have sprung up the country over, and will continue as part of the farmworkers' struggle. Fort Hamilton was a particularly apt and uncommonly welcome base for our demonstration that cold winter morn. As we marched and sang outside its towering stone entrance pillars, we thought of the group of "G. I.'s United" inside, who had just issued a proclamation stating they would boycott the base commissary in solidarity with the farmworkers, and refuse to eat Bud Antle lettuce.

Foley Square

A cup of coffee and an hour later, we proceeded to Foley Square and the Municipal Court building. Here the demonstration grew to include striking telephone workers, members and leaders of many local unions, and several political officials. Looking out over this motley, noon-hour crowd, Cesar Chavez began his speech with a most logical question: "Often we are asked, why is it that so many groups who don't agree on other points come together in support of the United Farmworkers?"

"Ours is a gentle revolution," Cesar responded, "and our supporters know we're not here today and gone tomorrow, that we'll struggle to the end" . . . "The power of nonviolence is so immense," he continued, "that no power can stop it. We are willing to fight and to fight hard, but we are also willing to love. That is what the whole struggle's about: that men know each other and themselves as human beings."

The rally's finale came when Cesar and a union lawyer entered the court building to issue a federal lawsuit naming Secretary Laird, Bud Antle and Major Walter Higgins (commanding officer at Ft. Hamilton). The suit seeks a preliminary injunction to enjoin and restrain Laird and Higgins from engaging in lettuce purchasing activity in excess of amounts bought prior to the strike.

Post-Prison Poems

By JACK COOK

Soupline Revisited

As if two years ago today
(We meet again outside the Worker)
Were but a prolonged yesterday,
He and Blacky, his still sole partner,
Forget the cold and downward way.
"Hi, Man," "You've been gone a bit," he sighs.
My hand reaches out in warmth and play—
But strange scene! Our eyes suddenly die—
To see, to touch where lost fingers cry.

In Deerfield, Massachusetts
For Tricia and David

I celebrate the gentle ways
Your snowbound quiet home affords;
This little house so richly filled
With all that is needed, ennobled, and loved;
My tension-twisted First Street soul
Unwinds, and, as the drifted byway
Smoothed by the noxious snow-mobile,
My churning mind now softly rolls
In easy rhythm through dark and day.

David, we are miles, we are miles
From the prison life we shared;
Yet as Ahab felt still his lost leg,
So we, too, though free, remain barred—
From the common pursuits, the ruts, and files
Upon files of those who ingenuously beg
Accomplishment, as in iron cradles they climb
A weekend mountain; then wind down—sleek pegs
Seeking refuge in safe and sanitary holes.

O, Gentle ones, stay loved and loving still.

Jan.'71

+ + + LETT

From Puerto Rico

December 14, 1970

Dear Dorothy,

You probably remember me because I have been in touch with Pat Jordan. I talked to him for about three hours last summer when I was in N.Y.C. We talked about our struggle for independence and the perspective of using non-violence (we called it **militant pacifism** in Puerto Rico) as our tactic. Lately there has been much discussion among militant people on the whole subject of militant pacifism.

The Puerto Rican Independence Party (PIP) have accepted militant pacifism as their way of struggling for independence and socialism. PIP is trying to be a political party and at the same time a movement of liberation. **"Peacemakers"** and **"A Quaker Action Group"** have been very much interested in our struggle for independence. Last summer I attended the first orientation program of the "Peacemakers" at North Carolina. About a month ago, PIP sponsored a seminar on civil disobedience and militant pacifism which was given to us by **Jean Goss** and his wife from the **International Fellowship of Reconciliation.**

I just wrote to Cesar Chavez expressing my solidarity with him for refusing to call off the lettuce boycott and choosing to remain in jail instead of betraying "La Causa." I wanted too that he know how our people are struggling against U.S. Imperialism. We have and are developing the following campaigns:

1. against the obligatory military service—Puerto Ricans are forced to serve in the Army of the U.S.A. since 1917. This campaign is so developed that nothing happens to the young men who refuse induction.

2. against the presence of **atomic** bases in our island. The U.S.A. controls 13% of our agricultural land for military purposes.

3. against the use of a tiny island called **Culebra** (about 20 miles east from Puerto Rico) as a **target** by the Navy of the United States.

The third point is the one that I am more interested to talk to you about today. Since April of 1970, the people of Culebra, the Puerto Rican Independence Party and other Puerto Ricans (in P.R. and in the U.S.) have been protesting against the constant use of Culebra as a target for the Navy of the United States and the navies of almost all Latin American and European countries. The people of Culebra and PIP have taken the following actions:

1. invasion by PIP of Navy target practice in Culebra for one day as an act of civil disobedience against a Presidential decree.

2. ultimatum given to the Navy people in Culebra by the people of Culebra.

3. a march of protest by the people of Culebra in Puerto Rico to make the **colonial** government of Puerto Rico and its people conscious of their problems.

4. a hearing in the U.S. Congress about the problem.

5. invasion by PIP of the Navy target area for four days.

6. another march in P.R. protesting the presence of the Navy in Culebra.

7. protest the decision of the Congress of the U.S. that the Navy should continue using Culebra as a target until the Department of Defense prepared a study about other possible spots for their target practice or the possibility of moving the 800 inhabitants of Culebra to another place in P.R.

8. 5 boats of Culebrans stop the Navy from making detonations of the old unexploded bombs buried in the ocean of Culebra, because this explosion was killing thousands of fish and destroying the the breeding places of fish.

9. last Saturday (December 12, 1970) about 500 Puerto Ricans living in the U.S.A. took a trip to Washington to protest the presence of the Navy in Culebra.

A Quaker Action Group, Puerto Rican Peace Center (the group that I work with), PIP and the Sane Committee of Culebra are going to sponsor a project in Culebra in early January. We are planning to build a chapel in the main target in Culebra as a symbol of **resistance** and **peace** in the face of the Navy shootings. I hope you will be interested in our project and would like to participate in some way.

Ivan Gutierrez del Arroyo

Through an oversight, we neglected to include the source of the article on "Socialism in Tanzania," translated from the French, which appeared in the January **Catholic Worker.** It originally appeared in the December 17, 1970 issue of **Temoignage Chretien,** the left-wing Catholic weekly published in **Paris,** and was reprinted by permission of the editors. The author, Denis Martin, is a young French writer who recently returned from Tanzania. We take the opportunity to call the attention of C.W. readers to this excellent journal, which was founded during the Resistance and each week provides informed commentary on political, ecclesiastical, and cultural matters. Its circulation in this country is apparently small (although some of our more perceptive journalists, like I. F. Stone, are faithful readers) and we are convinced it has a much wider potential audience. For information on subscriptions, write to: *Temoignage Chretien,* 49, faubourg Poissonniere, Paris 9e, France.

From Milwaukee

January 25, 1971

Dear Dorothy,

After a year in the state's maximum security prison, it seems only natural to be enthusiastically involved in a project like the Independent Learning Center. Many of the men I met in prison were from the neighborhood, working-class white and chicano, from which our school draws. Many of the men trapped in the revolving door of prisons began with problems our students now face.

ILC is a "free" school designed for the needs of low income, high school youth facing unbearable obstacles in the public school system. ILC is more than just a school for those involved. It is a whole style of living, focused on learning. Sometimes a staff member or student will spend over 12 hours a day in the school. We are open from 8 AM to 10 PM. There are no rules or requirements. A student can pick the subjects of his interest from about 30 course offerings, ranging from working in a Printing Co-op, Third World Studies, Math, Biology, Remedial Reading, English, Social Issues, to many more. Much use is made of the city as a learning tool. We regularly attend movies, meetings, plays, etc.

A first question asked by many who first discover us is how we are funded. The fact is that, although we are applying for private and government grants, we are not funded by anyone as of now. Since our beginning last fall, we have been making it financially with a little bit of aid from the University of Wisconsin-Milwaukee, VISTA, a local government agency, and from our friends. We will be sending out our first appeal letter soon. We charge no tuition. One of the lessons we are learning is how to humanly survive independently in a capitalistic society.

Are we a legitimate high school? Thanks to the efforts of a local, private, Catholic high school our students are fully accredited for their participation in ILC.

The students are discovering that learning is fun; our staff and teachers are learning that working without financial profit is rewarding. And together we are growing.

If your friend in Worcester, or anyone else you know, is interested in knowing more about the school, there is material available which we can send. Our new address is 1437 W. Lincoln, Milwaukee, Wisconsin 53215.

Peace,
Bob Graf

PS The Ex-Con Group plans are progressing slowly. However, soon we are sending over a thousand books and records to the State Maximum Security Prison.

From Baltimore

VIVA HOUSE
26 S. Mount Street
Baltimore, Md. 21223
December, 1970

Dear Brothers and Sisters,

A letter long over-due. In a small way we are still attempting to relate to the struggle in this country, and Baltimore still represents but another mirroring of the injustices perpetuated by the richest and most fire-powerful country in the world. You are many brothers and sisters who deserve more than our thanks for bearing with us and supporting us. Also, we would like to share with you the news of our last two years. We have not written a letter such as this since we first opened Viva House in October, 1968.

Our first days that October brought us in contact with the Catonsville 9, convicted felons for burning draft file trash in the public streets. We were able to share the house with them as a resting place during a week of momentous trial days. This experience helped to set some direction for the house, and provided insights into the "grotesque," that is, into the American system of injustice, which is today further—it pinpointed where poor people here and everywhere are trampled upon by Amrican Mother Church and Father State.

During the last two years we developed strong fellowship and community with the Catonsville people—Marge and Tom Melville, Mary Moylan, John Hogan, Dave Darst (died tragically in an auto accident last year), George Mische, Tom Lewis, Phil and Dan Berrigan. All of them helped us to grow. The days spent with these people before they were jailed (Mary is still "at large," to use their phraseology) were both beautiful and difficult. They all came at the issues from different viewpoints, and personalities; this helped to concretize and humanize many realities. One evident fact was agreed upon unanimously—the American way (the way of Nixon-Agnew, the way of an un-poor Church in bed with an exploiter State in complete disregard of the Testaments, the way of middle America clinging to properties, false securites, and the fable of electoral process) is crushing people and must be toppled with new imagination and alternatives.

It has become clearer to us, as it has to many Catholic Workers, that feeding, clothing, and sheltering people, as well as holding all property in common, are merely basic human responses to the inhuman condition, "goes without saying." The more enormous task is one of identification and confrontation. No one desires to view the children of the children of today's generation lining in the streets for bread, clothing, or shelter ad infinitum. On the contrary. If a poor person gains some knowledge of who is breaking his bones and spirit, he might refuse to be used any longer. He might, in fact, stand like the tree planted by the water—immovable. The American Giant is also firmly entrenched; he has dug in for the long haul and means to protect all the property he acquires, acquired, or will acquire. So it is extremely important to help in the identification of the enemy, and then refuse to accept his way of death any longer.

As we view things, the works of mercy are not "fantastic expressions" of Christian charity. They are merely expressions of humanity. Thus they are basic, but not solutions. We feel strongly that nothing but a revolution, a metanoia, a change of mind and heart will bring about what Nixon euphemistically calls "a just peace." To talk about reform or adhering to American law, which in the main protects property rather than people, is to talk absurdly. The need for new communities of resistance and new communities of life-style—building a new society in the monster's belly is fundamental. We have not taken up guns nor armed ourselves to the teeth, because we still do not see that as any solution. The rhetoric which urges poor whites and blacks to "kill a pig today" is not only **not** a solution, but this country is so powerful and so devious that it would (as a friend puts it) napalm the rebellious city slums while private industry raked in fantastic profits on the rebuilding. We still feel that non-violent resistance, which includes discriminate destruction of property, is still a workable alternative and has the best possible chance of winning the minds and hearts of the people. Of course many of you might view non-violence as naive or irrelevant, and we would welcome responses to this. At any rate, all of this—basic response to the human condition, the need for human resistance, and the formation of new communities is in the Christian tradition; it is in the tradition of Peter Maurin and Dorothy Day. More important it is in the human tradition.

After the trial we began living in community with those severely damaged by the American way of life—the rag-tag real; the winos who came at all hours, at any hour; the addict who needed the house TV set for funds and the addicts who got to feeling so good they burned a mattress and tossed it out the third floor wind; the mothers who came with their babies while the husband was imprisoned or just off the scene; those just released from hospitals or jails with no jobs and no money; and people in need of a simple meal or a place to relax. Meeting all of these people crystalized what the Catonsville people talked about and helped us to understand what this country was really about. During the time from November, 1968 to December, 1969 the number of people coming to the door for food or relaxation increased to such a degree that our house was too small for the numbers. So, in September, 1969 Willa, myself, and Tom Lewis (one of the Catonsville 9 and an artist who lived with us and worked on an eye-opening portfolio about prison and America) decided that we would concentrate all our efforts into providing a "living room" atmosphere for all the people who visited us each day.

After many weeks in the streets and long hours of discussion with regard to the relevance of a storefront, we located a place in a commercial area five blocks from our house and began building — Viva House — a Catholic Worker Community to serve the people—the true revolutionary is guided by great feelings of love.

Our goal from the outset was to make this a people's place and to create an atmosphere that would bring people together and lend itself to the discussion of important issues. So we converted three rooms into a kitchen, a clothing room, and a community dining room. Tom Lewis painted two huge signs on the outside that read "VIVA" and

ERS + + +

"CELEBRATE LIFE;" he also gave the inside walls a real expression of Viva with his silk screens and etchings. Phil Grimes worked with us last December and January and wrote Bobby Seale's Parable with Gren Whitman's sequel on the main wall. The parable is one for all times and all places and has created much discussion among the community; it deals with a hog who enjoys a necessity of life, water, and then will not allow his brothers and sisters to do so. So the parable is a vivid portrayal of life around the globe.

At present we are open at the storefront from 9 a.m. to 2 p.m., Monday thru Friday. We have coffee and cookies (Al Lewis provides us with Nabisco treats) on a help-yourself basis and then serve a robust soup around noon. Thus we have attempted to do away with a dreary soup line and hopefully open up new areas of communication. Our clothing room is open to encourage the women to stop by. Willa tries to pursue with them some of the real issues of womens' liberation. Society certainly needs to hear the voice of women and women certainly need the support of their sisters. Without engaging in heavy dialogue, we've been able to talk about the inhuman conditions in peoples' lives and then search for the causes. Poor people know existentially about the burdens "right on" their backs and they speak of them all the time. So it is only a further step to learn who makes the burden so heavy and why they are forced to carry it. This is the first step in the identification and confrontation of the enemy. It is the beginning of "self-help" and revolutionary change.

Our house on Mount Street is now a community house with everyone sharing in the communal experience. Frank, a social worker, Chris, a worker at a neighborhood day care center where our daughter Kathleen enjoys herself, Joe and Jim, who operate the storefront with us, and Willa, Kathleen and I form the body of the community. The entire experience is opening up vast areas for growth.

Again we thank all of you, but particularly we are extremely grateful to Mary Brawley who helped us in the rough early months, to Pauline Lewis, who prepared some tremendous meals for the people, to the Baltimore Anawim Community, which has done much to keep us going, to all those who cooked the holiday feasts at the storefront, to all our donors, particularly an anonymous donor who gave us the impetus to begin and continue the storefront.

So, after thanking all of you, we again seek your continued support. Our financial resources are decreasing rapidly and the storefront bills increase every month. The rent is $125; the gas, electric and heating bills run as high as $60 a month during the cold months; at present more than 100 people come in for coffee and we serve more than 70 meals each day, (these figures have risen every month since we opened) so food and supplies are costly; the four of us who work at the storefront do this full time and work odd jobs (when we can find them) to pay part of our living expenses. Thus, our operating the storefront depends entirely upon donations. We would enjoy hearing from you and be assured that you are more than welcome anytime. All power to a change of mind and heart in America!!!

With love,
Joe, Jim, Frank, Chris
Willa, Brendan, Kathleen

From England

Taena Community
Whitley Court
Upton St. Leonard
New Gloucester, England

Dear Dorothy,

I often think of writing to you, especially when the **Catholic Worker** arrives, but when I start there is always the same difficulty of sorting out what there is to say.

We hear so much about America in the news: I am always reminding myself that there is another more important America which one hears of in the **Catholic Worker**, and that there nothing could ever be as cold as it sounds on the news. The same sorts of things go on in England, but on a smaller scale and their effects are more subtle, and what one has to rebel against is less obvious. It is probably why we tend to become apathetic.

Things here at Taena haven't changed much. The Bishop has now given us permission to have Mass in our own chapel once a week, and we are served by one of the monks from Prinknash. We recently had a very happy Mass with several First Communions: we had a large congregation of visitors, and we (including the children) were able to take part in the readings, the bidding prayers and in the singing. We also had a most enjoyable breakfast party afterwards.

We now have an Indian working on the farm. He seems to have settled down quite well, and we enjoy his company a lot.

Apart from the weekly Mass and a weekly meeting in each other's houses on Saturday evenings, we have no organized community as such, but I'm

Rita Corbin

beginning to see how being related "at home" is the way to be related in the world. Sometimes it seems that everything in society nowadays militates against this happening, and that modern society only requires one in a functional capacity; and that moments of real being are less often possible.

Recently we were able to go to two meetings conducted by a Zen Buddhist monk who was visiting the Community near here. Altogether we spent only four hours there, but it made a great impression on me. I came away with the notion of wholeness. Everything is Zen; it can't be split up by us into good and bad. What I have to do will come out of my seeing, and not out of my superficial intellectual involvement. A lot of it is what June says, and a lot is what Sebastian Moore says, viz., that God is the meeting, not that God is in the meeting, not that God can be so to speak injected into life to improve it but that God is the whole of life, and is to be found by us in it, exactly as it is. On a beautiful day like today when to step outside is like stepping into Paradise, it isn't difficult to believe—but there are other days.

People like you who have been in prison seem to know about these things better than we. I remember that book about a concentration camp by Primo Leir and called IF THIS IS A MAN: one is taken through the most horrible situations that one could possibly imagine, and yet one is never drawn into resentment or hatred—one is shown what is, and out of it comes an extraordinary charity.

I think most of us are suffering the consequences of having put the intellect on a pedestal.

I think the move in England towards Comprehensive Schools will foster our appreciation of man as a whole again. We have a new one that has recently been opened in our district and all our younger children are going to be able to go there. It is a most exciting development.

We all send you our love and very good wishes. We read the **Catholic Worker**, and we think about you a lot although we so rarely write.

With very much love,
Hilary and Ron

Community For The Retarded

We are a family that has spent the last several years living in a village community for mentally retarded adults, and are now interested in establishing a hostel for these folks within commuting distance of an urban area. This home as we visualize it would initially accomodate our own family, plus volunteer staff and 10 or 12 handicapped residents in a sort of extended family relationship. This would provide a home away from home for those whose own families are no longer able to meet their needs, because of the death or disability of the parents. We feel that we could provide a homey atmosphere, and tension-free environment that is so essential if these folks are to be able to function in the work a day world. With this kind of supportive family background society can become a source of stimulation instead of a source of failure. In this sheltered residence they may continue to develop their own personality and social skills through vocational work and recreation. We would expect to utilize the resources of the community not only for its employment potenitial for these folk, but for cultural and recreational activities as well.

We would expect to staff this home exclusively with volunteers. Would any readers of the paper like to join us in this venture? Is there an existing religious community that would be interested in our services in an auxillary role? Would a diocese or religious community allow us the use of a building to initiate this project?

We are willing to relocate anywhere to bring this dream to reality, and we would like to accomplish this during the summer months so as to interfere as little as possible in the children's education. Our address:

Hostel Box 33
Tivoli, New York 12583

Tivoli: a Farm With a View

(Continued from page 2)

ing, the damage that will undoubtedly ensue from the great pipeline to be placed in Alaska.

I thought of the immense wealth of the oil companies, of the billion-dollar families that have been founded on and flourish on this oil, of the many who work for the oil companies, of all who use the oil—for heat, for power, for the multiple industrial uses of oil. So many of us are involved. Even here at the farm, we enjoy the heat of an oil-burning furnace.

I thought of the lands from which the oil is taken, and of the people who dwell in poverty there and have no use of the oil and derive no benefit from it. Yet once the great oil companies have totally depleted the land of this fossil fuel, there will be no more for the descendents of these poor people, nor for any of us.

The great geologic cycles of time that result in fossil fuels take eons of time, and are beyond, I think, even a computer's calculation. The responsibility of the great oil companies to today and our immediate future seems heavy and obvious.

Oil spillage not only ruins our coasts and kills vast flocks of shore birds, but also destroys immense quantities of living creatures in the sea. When we add the damage of oil pollution to the many other dreadful pollutants we have cast into the sea, we begin to see what the scientists mean who say that if we do not halt this polluting, the vast ocean will become a dead sea where no life can grow, where no longer will there be a huge storehouse of food to feed the hungry generations of man.

Then indeed millions of human beings will need to fear famine. Yet this need not be. The oceans can be saved, can become the reservoirs of food which will feed future generations if we—enough of us human beings—insist that the terrible polluting be stopped.

The great industrial and military complexes which have been responsible

and aptly rename itself "The Showboat."

Harry Woods, who recently briefed a T.V. audience on the Catholic Worker, has found himself in a curious position. On our regular Friday morning trips to Hunts Point Market for vegetables; you could often catch him muttering "I am actually boycotting someone I usually **beg** from!" (referring to the House of Bud, distributors for Antle who carry only scab lettuce and are refusing to cooperate with the UFWOC). Marcel, sporting a different hat for each occasion, has taken to wearing a button with a smile on it, so that in case he's not smiling, it can smile for him (Walter's considering getting a bushel of such buttons). Ever-Irish John McMullen, who needs no button for his smile, has added barley to his variety of soup bases. And Marty Arundel won a prize for turning the tables on joker Earl Ovitt when he bestowed upon him an autographed copy of **Fat Power.**

A bit of "culture" visited First Streeters the past weeks, as Noreen Toth sang in the Master Institute Chorus and listeners enjoyed works of Bach, Handel and other Baroque artists. And to the dismay of Mary Galligan's Scottish ears but the pleasure of some others, we've had our own "country and Western" music from Carolinian Walter on several occasions. Scotty of course always adds his own music. Though he slows down more every day, his physical stamina continues to astonish the medical world, and he laughs all too knowingly when reminded of his multiple proposals of marriage.

There seemed to be many hands around the house this month. Eric Spencer, from Colgate, added a real lift to the spirit and work the weeks he was with us. Connie Parks came down from Detroit for a week, and Jean LaRose, Dana's sister, visited one weekend. Just after Tom and Jeremy Gill left behind the California sun for a taste of NYC's winter, Paul Quinlan returned to Oakland after several months at the Worker. We wish you grace in your searching, Paul. Chuck Matthei, whose commitment to peacemaking challenges us all, has been in town for several weeks.

Friday meetings brought much of interest along with Jonas' sassafras tea. One evening Chris read essays from **The Green Revolution**, and from the lively responses of workers and scholars one would have thought Peter Maurin himself were present. Father Pierre Conway, an old friend to the Worker, analyzed the worker-priest concept. And from Cooper Union came Professor Richard Bowman, who described the many different types of "religious searching" he and his students have discovered on the Lower East Side. The man and his message conveyed a deep, simple unity that all people have in the face of their common seeking.

January takes its name from Janus, a Roman god and patron of beginnings who was to have had one head but two faces. It has been the month, for instance, when Apollo 14 took off and a "conspiracy to save lives" was arrested. We watch with Merton for the sign of Jonas, when "what was vile has become precious, what was cruel has become merciful," and rededicate ourselves to living every moment in such a way that this sign might emerge.

CROSSING INDIA: GANDHI'S INFLUENCE

(Continued from page 1)

fifth class and the smallest is in the third class."

I noticed that his hair was streaked with grey, though his round face was fairly young. He must be close to forty, I thought.

"I have to work long hours, but I can earn 200 rupees in a month."

He was proud of his achievement. I realized that he was one of the more fortunate men among the hundreds of thousands who had been sucked into the great dark maw of Calcutta from the surrounding countryside. Not many of them made $27 a month and had all their children in school. Mother Teresa knew people in all parts of Calcutta and she never mentioned how they had met. I often wondered at what point of need their lives had been touched by the works of the Missionaries of Charity.

As we settled ourselves on the hard slab of a seat in our compartment, Dorothy Day said happily, "I am looking forward to this train trip across India. I am glad we could not fly."

Mother Teresa said, "You have plenty of room here in this compartment. Even the Third Class in these big trains is mostly quite empty. I often sleep in the luggage rack on a long journey."

I knew her habit of hoisting her small body onto the hammock-like rack for a quiet sleep after she had finished writing letters—her invariable task on the train journeys that took her to visit Missionaries of Charity in twenty cities of India. I had no heart for the train journey and was only forced into it because Dum Dum Airport was under water, a casualty of the floods that paralyzed Calcutta during part of our stay.

I was still enveloped in the anguish of Calucutta, in the dead of the leper hostel at Dhappa where human flesh putrifies before one's eyes, in the stupor of the countless men, women and children who live and die on the streets and alleys, in the despair of the shack dwellers whose mud and straw shelters had been turned into mounds of slime by the pitiless monsoon deluge. I had resisted until the last moment buying the train tickets for Delhi. I had hoped that a speedy plane trip and a plunge into activities in Delhi would help lift the hopelessness that weighed me down. But when all flights were cancelled, there was no choice.

Mother Teresa gave us a bag of apples for the trip and stood to wave us off, a tiny white figure in the press of people on the Howrah platform.

A waiter took our order for breakfast, explaining that at eight o'clock the next morning a dining car would be attached to our Kalka Mail train. Then our beds were readied, meaning that two upper berths were opened out. The berths were covered with a leather-like material that was hard and unresilient.

The two women who shared our compartment took out their coverlets and blankets and made themselves comfortable for the night. One was a young woman with Chinese or Tibetan features, the other, an older Indian woman whose grand-daughter was brought to her berth as soon as it was made up. Dorothy Day stretched out on her bare slab without a murmur.

I climbed to the upper slab, noticing that the dust of the plains had begun to sweep in through the window. A fan in the ceiling, just above my face, swirled the dust around like light brown snow. As soon as the lights were put out, the compartment door was opened, and another current of dust entered from the open windows in the corridor.

There was no breakfast at eight o'clock because the dining car never met up with the Kalka Mail. We looked out at the groves of mango trees and at an occasional neem tree with fingerlike leaves. Rice paddies in uneven shapes gave way to stretches of land with herds of cows and goats.

They were watched by men naked except for loin cloths. One of them stood like a statue, braving the molten sun under an enormous black umbrella.

In one long field, a white-clad farmer followed two stark white bullocks in ploughing a furrow. We passed village after village, squat and dun-colored. When the homes were thatched, they seemed to cling to the earth like large mushrooms. The roofs of many village houses were of orange-red tile, brightening the landscape like bunches of marigolds.

I always looked for the mandir, or temple, and sometimes spotted it. The temple of one neat village, near Etawah, stood alone at some distance from the houses. The fluted bulbous dome shone like a yellow balloon against the pale blue sky. Despite the encrusting dust, which was swept up every few hours by a railroad employee, I began to be glad that I was crossing India by train. I thought of the villages I had known on earlier visits. There was often poverty, but not the death-in-life poverty of Calcutta.

There was beauty, too, in the naked, darting children, in the graceful women and their brass waterpots, in the red mark that a woman carried along the middle part of her black hair.

This was the mark signifying that her thoughts should be concentrated on her husband and that her fidelity should be total and eternal. There was beauty in the way the men worked with their animals, and above all, in the way they carried out the sacred custom of "cow protection." This was not merely superstition, but, as Gandhi put it, cow protection stood for "the protection of the dumb creation of God."

I thought back to Calcutta and of the victory I had won over myself. When Mrs. John, a dying Anglo-Indian, was being brought to the Kalighat Hostel, I had been able to help carry her. She was resting on a light wicker chair which was borne by two Sisters.

By an effort of will, I had supported her legs from the ambulance to the pallet in the Hostel for the Dying. That one small act made me feel better about my stay in Calcutta.

My thoughts were interrupted by the noise of our entry into a busy station—Allahabad, the holy city at the confluence of the Ganges and Jamna rivers. Here at last we could order breakfast from good hawkers or from the station canteen. It was close to 11 a.m. For Dorothy Day, who needs an early cup of coffee to start moving in the morning, this must have been the hardest day of our whole journey. I had longed to spend some time in this ancient pilgrimage city and was disappointed that all we could see from our carriage window were some far-off roofs and nearby crows pouncing on scraps of refuse on the platform.

At Kanpur, a number of other passengers were consigned to our compartment. They included a Parsee woman with high-bridged nose who spoke perfect English, a beautiful, liquid-eyed Punjabi girl in purple pants, turquoise overblouse and flying filmy scarf, and, much to our surpise, a boy of about twelve. Ours was a woman's compartment, but the boy's mother explained that because of his age, he was assigned this place during the day-time ride. He was a Sikh youngster, too young for a beard and full turban. His uncut hair was secured in a top-knot covered in white material and tied with a white butterfly bow. Sikh, Assamese, Parsee, Punjabi, Orthodox Hindu from central India—here in one compartment we had a sampling of the dazzlingly wide spectrum of India's racial and religious groups.

Instead of proceeding to Delhi, our train was switched to a siding where we sat for a steaming hour. There had been an accident and the tracks ahead had to be cleared. We got to know our compartment mates. The young woman with what I took to be Tibetan or Chinese features was an Assamese doctor, on her way to Delhi to "stabilize" (her word) her appointment to a government hospital in Manipur. She was tall and slender and her dark grey silk sari was splashed with orange and yellow flowers. The Indian woman with the seven-year old grand-daughter spoke no English. At six o'clock in the morning, she had sat upright with a prayer book in front of her to begin a low chant of a chain of mantras. Her husband, who came in from another carriage, introduced her to us and offered to share with us the wicker basket filled with vegetarian foods that they had prepared for the journey. We took some rich honey sweets.

We talked with the Parsee woman about our stay in Calcutta. The Parsees came to India from Persia in the 7th century, taking refuge from the Moslems who overran their country. They have preserved their Zoroastrian reverence for the elements such as fire and water. There is a never-extinguished fire burning in their temples not unlike the sanctuary lamp in Catholic churches. Reincarnation is not part of their system of belief. Instead they see the soul as facing a Last Judgment. Each soul must cross a bridge which narrows for the sinful one until he falls into the kingdom of darkness, but expands for the righteous one so that he reaches the kingdom of light. The Parsees are well known for their social welfare and educational initiatives, especially in Bombay. When we mentioned that we had seen the work of Mother Teresa, the woman became animated. She not only knew about her work, but felt somewhat involved since her nephew had been the winner of the white Cadillac raffled by Mother Teresa.

"You know," she reminded us, "that the Cadillac was given to Mother Teresa by Pope Paul when he came to Bombay for the Eucharistic Congress. We all took tickets because the money would go to the care of lepers. My nephew could never use such a car, he sold it and gave a part of the sale money to Mother Teresa."

As we talked on, we found out that the Parsee family to whom I had been closest during my second stay in India were also close friends of hers. I wondered if perhaps most Parsees in India either know, or knew of each

(Continued on page 7)

On Pilgrimage

(Continued from page 2)

every room of the old house we had rented which had formerly been headquarters of the longshoreman's union. There were many homeless and unemployed so we were certainly overcrowded and perhaps a health hazard. One of our friends donated his truck and moved in with the two young men who were running the house and there was not a day when we were not taking some of our poor friends to the hospital. There were four young men running the house and many a time they donated blood. They gave up their beds and slept on the floor to accommodate these destitute ones. What is more they endured danger and abuse. A number of times men had to be gently disarmed. They had the courage born of crisis and the sense of safety which comes from a deep religious faith. "Were you never afraid?" I asked Jim Rogan once. "When I had to take a knife away from a man, I sure did shake a bit afterward." He told me another time, rather sheepishly, that one night when he had been sleeping on a bench he awoke to find a man urinating on him. It was to show his contempt—that was the hideous part of it—the contempt, the resentment, the bitterness of the poor.

The house was eventually closed by court order as a public nuisance. The boys had already been in court a number of times. When the young men were brought to court, priests from the Josephites (Father Phil Berrigan's order) testified for them, especially when the charge was that they were running a disorderly house. Nevertheless the house was closed. Whites and blacks together under one roof was not acceptable at that time in Baltimore. Jim Rogan went into a conscientious objector camp which, to the benefit of all concerned, was a "camp" within the Alexian Brothers Hospital in Chicago. He took his training as a male nurse there. He used this training some years after his marriage to go to Durban, South Africa with his wife and two children, and work in a hospital for Africans and Indians for three years.

The Houma house was closed also because it was interracial. The young priest who started it, Father Jerome Drolet, made a vacant lot into a ball park and had interracial teams competing thereon. He also was indiscreet enough to invite men off the road into the rectory to take showers and partake of hospitality there, which was not at all acceptable to his pastor. So he was transferred and the house was closed. Perhaps he was kicked upstairs to study sociology at Catholic University in Washington, D.C. I am not sure. He has since had the courage to face a crowd, a mob (with his only companion a Protestant minister) which was trying to build up the lynching spirit against a lone black man and his two children who were trying to enter a white school when attempts were made to integrate it.

The Memphis House also is closed now. It was run as a day care center for babies of the neighborhood whose mothers were cotton picking in Arkansas and Mississippi. I stayed there also when it was against the law for whites and blacks to share the same house. The house was closed when the girl who ran it moved west. She was a young black nurse, and a skilled writer. She married and has a family of her own now.

Our contacts continue. Right now in the house of hospitality at First street two black women help mail out the paper, and Jimmy, whose she long hair I am always threatening to comb for him, is an interesting artist whose pictures we have never been able to reproduce in the CW because they are in wild color and certainly on the psychodelic side. Marion has a dog, where she lives down the street who has a strong and ominous bark. She named him Heathcliff. Minerva is always bringing treats to us all from her own home in Seagate—where she has a number of grandchildren who visit us too. Her recent treat was a big pan of cornbread dressing for our Christmas turkeys, and the other day she came in with a plate of fried chicken and hot biscuits, a meal not enough for the House, but enough for the women on the third floor.

In Harlem itself there are Joe and Audrey Monroe who spend many a week end and holiday with us at Tivoli. Joe was the one who triggered the demonstration at Morningside Park over Columbia University making a deal with the city to get a piece of that Harlem public park for their gymnasium. He was the one who sat on the bulldozer and led the demonstration and was arrested with eighteen others. During the occupation of one of the Columbia buildings during the student strike, Joe and Audrey organized a mobile soup kitchen and brought food to the blacks in Jackson Hall. They should have written about this but it is like pulling teeth to get people to write of their adventures and our activists do not include good interviewers right now. Elaine Freeman, a beautiful young woman with five children in the Tivoli slum, is a writer too and has contact with a number of those at the farm. We are a good school of non-violence, I often think, with class war (workers and scholars), race war, war of the sexes, war between young and old, children and parents, always breaking out in small ways in our midst.

"Black studies" into our own situation in the United States, our history, culture and religion is going on apace. We are calling attention to the emerging Africa, right now to such leaders as Julius Nyerere, Kenneth Kaunda, and Milton Obote.

In This Column

It all goes together somehow—the things I write of in this column, things that have happened in the past, things that are happening today. The past looks unutterably horrible with its lynchings and the tale has been told again and again of blacks burned alive, dragged behind cars through the

(Continued on page 8)

Crossing India

(Continued from page 6)

other. She asked us if we had friends to go to in Delhi. When we mentioned that we were worried as to whether we would be met since we did not know whether our wire had been delivered, she offered to have her husband and family take care of us until we had found a place to stay. Fortunately it was not necessary. When we arrived in Delhi, we were met by Debora Schack of the Grail Team and Ad Perquin, nutritionist on the Catholic Relief Services staff. We were the classic dust-begrimed travelers and were glad to be driven to the International Guest House of the YMCA. We had completed the 900 mile trajectory in 25 hours.

Most visitors to New Delhi make their way to the Rajghat, the cremation-place of Gandhiji. Dorothy Day and I sat and prayed under a veranda facing the shrine-area. In front of us, lettered large were the words of the Gandhi Talisman, and they seemed to become part of our prayer. It began: **Recall the face of the poorest and the most helpless man whom you have seen and ask yourself if the step you contemplate is going to be of any use to him. Will he be able to gain anything by it? Will it restore him to control over his own life and destiny?**

Gandhi's message ended with the confident assertion that if the action were truly in the direction of self-rule for the neediest and most spirtually starved of our fellowmen, then all our doubts about ourselves and our work would disappear. It was the hottest time of the day as we rested there, but the stream of people never abated. It was a healing time for us to see the reverence for Gandhi in this peaceful, open place. We had just come from a city where there was an active campaign to smash the pictures of Gandhiji, to vandalize Gandhi libraries, and to do everything possible to erase Gandhian teachings from the minds of the young. New Delhi was in this respect an antidote for Calcutta.

Across a wide road from the Rajghat is the Gandhi Museum where we saw a large photograph of Gandhiji lying dead, his breast pierced by three bullets. As the bullets smashed through his body, his mouth had framed his last word, "'Hey Ram," "Oh God." We had an appointment with the Secretary of the Gandhi National Memorial Trust, located near the Gandhi Museum. Devendra Kumar Gupta, the Secretary, took us into his plain office and served us a cold drink. The Catholic Worker was well known to him and he was happy that Dorothy Day had finally reached India. He was a tall man, dressed in plain white khadi, or homespun. We asked him about the weaving of khadi, a self-help activity basic to Gandhi's program of village uplift and self-rule.

"The khadi program goes on," said Gupta. "About 200,000,000 rupees worth is now produced annually." (The rupee is seven and a half to the dollar.) "Let me show you our newest spinning wheel."

He took out a compact spinning wheel and started to operate it. Dorothy Day was enthralled and related how her daughter Tamar had learned to spin and weave as a little girl. Dorothy practised on the little spinning wheel until she could work it.

"With this charkha, any villager could learn to spin. This is the smallest. It has only one spindle. There are some that have four spindles."

I thought of Gandhi sitting at his charkha trying to spur village India to meet its own needs so that the economic ties of colonialism could be broken. One of his rules for satyagrahi, those who took part in nonviolent campaigns, was, "He must be a habitual khadi-wearer and spinner. This is essential for India." The charkha became the symbol of Indian independence and is the central design of India's green, white and orange flag.

Gupta went on to talk in a measured way about the Gandhian social programs very much alive in India.

"You know that the work of Vinoba is spreading. It keeps alive the spirit of Gandhiji, **sarvodaya,** the welfare of all. The gift of land, the **bhoodan,** launched us into a much more revolutionary step, the **gramdan,** gift of village. The title of all the village land is turned over to the village assembly. The owner can still cultivate it and can will it to his heirs, but he must not sell it without the agreement of the village assembly. One-twentieth of his land holdings will be surrendered to the landless of the community.

"Every family or working person is asked to donate yearly one-fortieth of his produce or work-time to a village fund. When three-quarters of the villagers including the owners of more than half the local land, are agreed on this course of action, we have a **gramdan** village.

"Nearly 100,000 of our villages are already **gramdanized.** But then we have about 580,000 villages in India. By far the greater number, over 40,000, are in the state of Bihar.

"These **gramdan** villages may be seen as islands of compassion where each member of the community is reminded daily of his loving dependence on every

other member. We set in a **gramdan** village how a meeting house, a nursery, a village store, a school, a mlik cooperative can be started through voluntary cooperation."

"But islands of compassion are not enough. We must find ways toward the kingdom of compassion. Perhaps Bihar, where Vinoba's work has brought the most fruit, can point the way. If most of the villages in Bihar, for example, make a declaration of **gramdan,** then there can be a gift of state. At that point, there would come into being a sort of social compulsion for the non-cooperators to cooperate. But there would be no other force or compulsion. The basis would be compassion, not compulsion.

"We started with the village. That is where more than four-fifths of our people are. Following Gandhi, we begin with the lowest and the least to build the new structures of the new society."

As Gupta spoke, his eyes were fixed on Dorothy with a gaze of warmth and compassion. I thought of Gandhi who went about the villages of India with the message of the Sermon on the Mount, telling people to practise mercy and compassion with each other, and also with their oppressors, the representatives of the British Raj. The kingdom of compassion that Gupta was talking about was none other than the kingdom of love, for mercy and compassion are only love responding to need, love going out to meet the needs of the person loved.

But Gupta was not anchored to a cloud. He had worked in a village himself and knew the tensions of day-to-day living.

"We need a group trained to resolve fights and tensions nonviolently. We have a real beginning in the Peace Brigade, the Shanti Sena. The first Shanti Sainiks were part of Vinoba's **bhoodan** teams, but in the past few years, people outside the bhoodan movement have volunteered. The Gandhi Peace Foundation, a part of the Gandhi Trust, is taking over the training of Shanti Sainiks in nonviolent techniques in various cities."

We asked him what sort of activities the Shanti Sena would engage in.

"I will tell you a personal experience," he replied. "I was at a meeting when a man appeared who belonged to the community to which Gandhi's assassin belonged. The group was en-

A Farm With a View

(Continued from page 5)

for such terrible forms of pollution must not only stop polluting but also bear the major cost of cleaning up areas they have polluted.

Surely the struggle against pollution is one where youth is most needed, where the energy, intelligence, daring, and idealism of young people will almost certainly result in victory. For if they lead in such a struggle, they will be surprised how many older people will follow, how easily the generation gap can be bridged in such a cause.

Let them throw away their brain-damaging drugs and their masks of apathy or nihilism. Here is a cause, a challenge, a dedication on which their future depends, their future and the future of their children and their children's children's future.

Here in the struggle against pollution is reality, is relevance. Let them hold up, as the great mythological hero, Hercules, once did, the weight of the world, the fate of Earth's survival. Let them, by destroying the ugly dragons of pollution, by making Earth fair and fruitful again, "give beauty back to God."

But now, today, it is the first of February, and an arctic air mass holds us in the prison of winter. We are a large family this winter, and so have more problems. We have more children, ranging from under a year to fourteen.

As one might expect, some noise and confusion attend the order of our day. Nights, too, sometimes, though we also have our pleasanter periods. What with winter cabin fever, there seem to be more personality clashes among us; and the traditional wars between the sexes, the young and the old, the workers and scholars, become more noticeable.

Our Catholic Worker community is, I think, a kind of microcosm of the larger society about us. Whatever the problems found there will probably be found among us. We almost always have persons living with us who are afflicted with alcoholism or mental illness.

In the past few years we have had more of the alienated young in our midst. At times we see the development of the sub-culture phenomenon, with its emphasis on underground activities, hostility towards authority and the old, glorification of drugs. Drugs are, of course, strictly forbidden in our community, since we have no way of coping with this problem.

Sometimes drug users do show up in our midst, but when discovered, they must leave. It is sad that anyone should have to go, but it is even sadder that anyone should take an unfair advantage of the beautiful freedom which is such an important part of the Catholic Worker tradition.

There certainly ought to be more halfway houses to help those who want to give up drugs. It has often seemed to me that this is a work which more religious orders might undertake. Some of them seem to be looking for something more relevant. What could be more relevant than helping the drug addict?

Not all the young people who come to us are alienated. Many are very helpful. Betsy Blakeslee is such a one. Betsy, who plays the guitar and sings sweetly, is also an enthusiastic organic gardener, and brought up many fresh vegetables last summer.

Last fall, she helped with the canning and preserving. Now she is one of Marge's principal assistants in the kitchen, and even succeeds in giving Alice Lawrence the day off she so much needs. Betsy's cooking and baking are not only good but good for one, according to the teaching of the health-food experts.

Another person who helps keep us up to par in health is David Wayfield, who not only bakes good whole wheat bread but also makes yogurt.

As always, there are many persons who deserve much credit for keeping things going during the difficult winter months. Marge Hughes, who is in charge, deserves much credit, but she has, thank God, a number of helpers. We thank them all.

Stanley Vishnewski and Hans Tunnesen have been making good recoveries, Stanley from his heart attack and Hans from his fractured arm and shoulder. As for the rest of us, we have our ups and downs with colds, viruses, etc.

In the month of January, we were all much saddened by the death of Mary Hughes. She was buried in the Catholic Worker plot in St. Sylvia's cemetery in Tivoli. Monsignor Kane and Father Andy Crusciel said the burial service.

Then Dennis Cox played and sang two songs, which Mary, I think, would have loved. There were present members of the Hughes family, many of Mary's friends, many from our community, and some who had known Mary for most of her life: Charlie and Agnes McCormick, Bob Ludlow, Anne Marie Stokes, and Mary Boyd.

The grave had been dug by men from our community; and Dennis's music hung over it like a wreath of song.

It is night of the first of February, the month which means *to purify.* Tomorrow is the Feast of the Purification. We move towards Lent. *Agnus Dei, miserere nobis.*

Interview With Cesar Chavez

(Continued from page 1)

lost points. The day after it was on TV, how bad the guys were. A lady came to the vigil in a Cadillac and gave $25. They wanted to take her name and address and she said no, I trust you: I'm giving you $25 because I think I understand one thing—I want to become an American again. I can't give you my name because my son is a grower." You see, that kind of spirit, that kind of discipline, nobody can reject. You can't beat it.

EL MALCRIADO—During the confinement, how did you feel physically and mentally?

CESAR—Physically very well. Psychologically I was prepared. Spiritually I knew I was going to jail. So I just made up my mind that I was going to go and not be suppressed. I said that they could have my body here but my spirit's going to be free. It took me a couple of days to get used to the routine. You see, all of a sudden I'm in jail—I'm confronted with just an upside down of my life schedule. On the outside I'm going 16 hours a day every day. I had to schedule my time inside so I would use it wisely and make the best out of my stay. I just settled down and said I got to work myself out of it, and I did. In fact the almost three weeks in jail did not seem like a long time. I lost about 15 pounds, eating about a quarter of what I would usually eat outside.

EL MALCRIODO—What are your thoughts about possibly going back to jail?

CESAR—I don't want to go back, but if I have to I will. To commit civil disobedience I wouldn't have had a hearing. I would just tell the judge I'm guilty, give me the maximum time. Although I wanted to do that, I had to consider the union. If it had been me personally I think that I would have pleaded guilty and asked for the maximum time.

EL MALCRIADO—What is in store for our future?

CESAR—Back to the grind.

ON PILGRIMAGE

(Continued from Page 6)

street, castrated and hung, fingers cut off and kept as souvenirs, stories to match the horrors of Vietnam and Brazil today. Only a few years ago students kidnapped, beaten and buried, two of them white youths and the other a black, was not the last atrocity in this tale of suffering. I remember the black who ran a little cleaning establishment who was locked in his shop which was sprinkled with gasoline and set afire a few years ago. It took him a few days to die. And how many black students and slum youth shot to death this last year!

It is hard to be complacent about gains made. Such gains for instance on my last visit to Natchez two summers ago when we could drive around in a car together, black and white, eat together at restaurants, visit the tutoring projects where black and white worked together. But destitution continues, the war goes on in Vietnam, Cambodia and Laos. And how many other wars are we responsible for, providing armaments for the world as we do.

I speak of past horrors, but who knows about the conditions in the prisons today, the beating and the torture which goes on. Where there is continuing suicides of young Puerto Ricans who have been beaten cruelly and who despair of any justice. Riots take place in four city prisons at one time, yet conditions remain the same and more terrorization continues. We can be glad that there are some among the whites, like the Berrigan Brothers who with all the others who have had jail experience are witnesses and accusers of the injustice of our so called justice, who are suffering side by side with their brothers.

We have a letter in this issue from Bob Graf, one of the Milwaukee 14, about the school for ex-prisoners which has been started in Milwaukee and which we will write more about as we learn more about it.

We would suggest too that more books be sent to prisoners, books such as Julius Nyerere's speeches and writings. There are two volumes of them, published by the Oxford University Press. In them are teachings for us all. Others beside me have found the similarity to Peter Maurin's writings, nobility of thought, the practicality, the simple directness of style. Keep asking for them in book stores. They are in paper back as well as hard cover.

As I am writing this I remember that in Dar es Salaam in Tanzania last September I was invited to speak to a class of sixteen Tanzanian young men who were studying journalism. They were to ask me questions, and then write an interview with me as a visiting American, an editor and writer myself. The best interview was to be reprinted in the local paper, the largest paper in Tanzania. I enjoyed the encounter with these young men, which enabled me to know something about them by the very questions they asked, and their response to my answers. And indeed a few days later an interview was printed. I had all but forgotten this meeting, and certainly did not see the significance of it until I read a report of a visiting English economist who was analyzing the economy of the country and its resources. Tanzania is an agricultural country, 95% of the population living in villages. How to build up the villages rather than the city where slums build up is one of the problems. This economist says it is not only the question of better farming methods and increasing the food supply, building schools and clinics, but it is also a cultural problem. He advocated the production of small local news sheets with contents appropriate for people living in poverty . . . Apart from the news, the poor need small pamphlets with printed matter and visual supports which describe down-to-earth possibilities of self help and self improvement—how to build a small feeder road; how to improve one's house; how to feed one self and the children; how to paint, make music, and further develop the culture.

I wondered after I read these things if the British journalist who was teaching this group recognized the gulf which separated the city man from the country man, the antagonism between the student and the worker and so on. We see it all the time around the Catholic Worker. I have often thought, when heating systems, plumbing and electrical systems failed, it was the "worker" who could teach us to survive.

I would hate to see groups of Tanzanian journalists alienated from their people and its needs by western journalism—"giving the people what they want," recording history rather than making history.

As I Write

As I write, Arthur J. Lacey calls me to tell me of the death of Tony. He was an epileptic, he drank, he had been in the Bellevue psychatric ward once or twice and he was a person we all loved. He used to cook for us Sundays when he finished his week's work elsewhere. He was a good cook and earned his living. He had a little apartment on Allen Street where many of our single men live. He had a girl, hoped to get married. This was a new development and I did not know her. Tony was a Russian, born in the Argentine, or just raised there, I do not know which. Today his girl who had not seen him for a week asked one of our men to go with her to Tony's apartment to find him, and there they did find him—dead. He had been dead five days, the medical examiner said.

And as I write, I must record here too, the death of Mary Hughes, 23 years old, who was living in the East Village, but who had grown up with us on Staten Island. How tragic is the death of the young. Neither Deane Mowrer nor I could write last month, so hard it was to put even this stark fact down on paper.

We in America are being afflicted for our own sins, and for the sins of our country. To me that phrase, "My country right or wrong," means that we are all responsible. We are our brothers' keeper. It was the first murderer who said "Am I my brother's keeper?" Mary was a little victim of our cruel time. And there is so little we can do, so little we have done, to bear one another's burdens.

The Primacy of the Spiritual

It is certainly borne in upon us, day after day, how little it is that we do, or can do. But we are not alone. I remember that sense of shame at turning to God, as I lay in a cell at Occoquon, Virginia, so many years ago. I wanted to stand on my own feet. I thought there was something ignoble about calling for help in my despair, at my first taste of real destitution, of utter helplessness in the face of the vast sufferings of the world. I read the Scriptures, as Ammon Hennacy did. It was the only book we were allowed in jail. But I was ashamed and turned away in the pride of youth for another dozen years. Then it was in gratitude that I turned to Him again, for my own happiness, for the beauty of the sea and the sand, for the smallest shell, the tiniest creature, the gulls, the sky and clouds. It is easier to praise God then, to thank Him, to call upon Him, and to learn that He does indeed answer.

But when we are able to bear some small share of the sufferings of the world, whether in pain of mind, body or soul, let us thank God for that too. Maybe we are helping some prisoner, some black or Puerto Rican youth in the Tombs, some soldier in Vietnam. The old I.W.W. slogan, "An injury to one is an injury to all," is another way of saying what St. Paul said almost two thousand years ago. 'We are all members of one another, and when the health of one member suffers, the health of the whole body is lowered." And the converse is true. We can indeed hold each other up in prayer. Excuse this preaching. I am preaching to myself too.

January and February are those months when winter seems interminable and vitality is low. In the face of world events, in the face of the mystery of suffering, of evil in the world, it is a good time to read the book of Job, and then to go on reading the psalms, looking for comfort—that is, strength to endure. Also to remember the importunate widow, the importunate friend. Both are stories which Jesus told. Then to pray without ceasing as Paul urged. And just as there was that interpolation in Job — that triumphant cry—"I know that my Redeemer liveth," so we too can know that help will come, that even from evil, God can bring great good, that indeed the good will triumph. Bitter though it is today with ice and sleet, the sap will soon be rising in those bare trees down the street from us.

Crossing India

(Continued from page 7)

raged and was ready to express its rage against this one man. They would not be calmed. There was only one thing I could do. I put my arms around him so that if they attacked him they would have to attack me. The man was saved.

"At one of our market towns, two groups separated by an old dispute decided to settle it with **lathis** (metal-headed sticks). They started at each other when a Vinoba worker stepped into the middle, begging each side to stop the violence. He was knocked down and hurt for his efforts. When the fighting men saw him lying hurt and helpless, their anger petered out. One of them said, "He was hurt because he wanted to prevent us from hurting each other." They found another way to work out their dispute.

"What sort of people will you recruit for Shanti Sena?" I wanted to know. "Young people, city people, rural people, university graduates?"

Gupta's answer went beyond such categories.

"We want people who are socially conscious but not politically aligned. But I do not need to tell you that most people who are socially conscious are already politically aligned. We need a group of people in the Shanti Sena who can love both sides and are willing to suffer the consequences. I feel that those who come to the Training Camps at Indore or Gauhati, and to

the smaller courses around the country, have this as their objective."

I mentioned that Narayan Desai, Secretary of the Shanti Sena, had made a deep impression by his talk and by his very presence at the War Resisters International Conference held at Haverford College, Pennsylvania, in September 1969. Desai's Training Manual for Instructors and Organizers of the Shanti Sena had been photocopied for some of us who heard him.

"Of course," Gupta explained, "the Shanti Sainiks will not be resolving conflicts on a full-time basis. They will be involved in village uplift, health programs and cooperatives, perhaps well-digging. But they must also be ready at any time to be the reconcilers. If there are Shanti Sainiks in the area, they are sure to be called upon. Recently, the police called on the Shanti Sena in the case of a fight between two unions. The Shanti Sainiks had established their credentials for objectivity. They were able to play a part in resolving the conflict."

"There are so many divisions in our society. There are 100,000 groups and sub-groups in our society, for example, who do not intermarry. Lines of sympathy, or lack of sympathy, are clearly drawn within such groups. It is not enough to wait until conflicts and even riots break out and go in to provide relief. We must be there to stem riots before they break out. We must be there as peace-builders and as community builders. We must work with the least in our society, with the landless, the rejected. In an acquisitive society, the poor are like defeated players in a bad game. The social sanctions of a non-acquisitive society would not bear down on the poor. They would not feel so defenseless. Through their gift of work, they would be part of the village assembly in a **gramdan** village. They would feel part of a whole network of gramdan villages, of that network of compassion that Gandhi brought to birth in **sarvodava.**"

Gupta had a special gift for Dorothy Day. It consisted of the entire life of Gandhi in a series of colored lithographs, in size about four by three feet. They had been produced by Indian artists during the Gandhi Centennial year of 1969. Gandhi was born on October 4, 1869. He took them out, one by one, and showed them to us. In all there were thirty of them. His lean, striking face had a special light of its own as he described in a few words the steps in Gandhi's pilgrimage. Then he presented to the Catholic Worker and Pax a set of Gandhian publications printed during the Gandhi Year. Among them was a life of the Mahatma in comic book style, complete with bright colors and conversations lettered in white balloons.

Devendra Kumar Gupta thanked Dorothy Day for coming to New Delhi and for her long work for the spiritual values that are the seeds of peace and human brotherhood.

"We believe," he said, "that it is only through the spiritual force in man that he can rise out of the morass in which he finds himself. All people who feel the importance of this spiritual force must join hands."

As we drove past the Rajghat, I thought of those groups of Indians training for service in the kingdom of compassion, for nonviolent resolution of conflict by Gandhi's method of accepting suffering rather than inflicting it. At the back of my mind, nightmare scenes intruded of the young people of Bengal, the Naxalites, meeting to fabricate the pipe bombs that blinded and killed policemen, and to plot the beheading of the minor landlords of the villages. The Naxalites pattern their activities on those of Mao. They feel that only by bringing down by force the rotten around them can they impose a new and better structure. Jayaprakash Narayan, a powerful Indian leader and long-time supporter of Vinoba's **bhoodan** and **gramdan** programs, put the choice before the Indians as follows: "There are only two ways, Vinoba's and Mao Tse Tung's."

Vinoba's way was Gandhi's way, as Gupta had described it. It had achieved much, the collection of 4,000,000 acres and the distribution of 2,000,000 of those acres among half a million landless Indians. This was more than twice the achievement in land reform by the various State Governments of India. And of course, much more is involved than a mere transfer of land from possessors (not always rich) to non-possessors. What is involved is a revolution in human relationships and in the social structure.

But little is known of the actual achievements of this revolution aside from the dramatic pictures of Vinoba marching through the land begging landholders to consider a landless poor man as another son.

Devi Prasad, who worked with Gandhi and now heads the War Resisters International, attributes this lack of knowledge on our sick concept of what constitutes news. Prasad points out:

"Firstly, the information media are not interested in something which happens gently. They must see flames and tanks before they are convinced that something is happening. The same is unfortunately true about the consumers of the media. They have got used to expecting 'hot stuff' all the time. Secondly, man has lost faith in himself as an individual. Therefore, he fails to see revolution being carried out by ordinary people like himself, especially a revolution without bloodshed."

4-24-72

Migrant Workers Get Labor Agency's Aid After Task Force Discloses Exploitation

4/24/72

By a WALL STREET JOURNAL *Staff Reporter*

WASHINGTON — The Labor Department began a 13-point program to curb widespread exploitation of migrant farm workers after finding that one of its agencies failed to prevent such practices.

Labor Secretary James D. Hodgson announced the program after releasing results of a 10-month study on how the Rural Manpower Service Agency, along with other governmental employment services, works with the nation's migrant workers.

A special departmental task force, which prepared the study, indicated that Rural Manpower Service appears more intent on serving farmers than protecting migrants' rights.

The report claimed pervasive abuses of minimum wage, child labor, housing and sanitation laws. The task force also reported widespread racial discrimination, including segregated housing, transportation and job-referral procedures, and discrimination by national origin, sex and age.

Mr. Hodgson said the government had allocated millions of dollars to help thousands of migrant workers "move out of their traditional work and into nonfarm, steady employment."

"However, it is clear to us that our corrective measures have not been strong enough and in some cases have not been fully carried out," he said.

Mr. Hodgson said, as part of his corrective program, he has ordered consolidation of the Rural Manpower Service and the department's employment service to offer a "broader spectrum of services to rural workers and employers."

He said steps will be taken to insure compliance with minimum wage, civil rights and child labor laws and to improve housing, transportation, sanitary and safety conditions, among other things.

The 18-state study was conducted after migrant-worker groups complained the agency permitted illegal actions by farm owners. The migrant-workers groups urged that Rural Manpower Service be abolished and its $23 million in federal funds be turned over to a "worker service" staffed by and oriented toward the migrants. However, Mr. Hodgson indicated the agency would be retained and made more effective.

Farm Workers Union [1972]

More Is at Stake Than Unions in the Crusades on Farms

By GUY HALVERSON
Staff Correspondent of The Christian Science Monitor

The national boycott against iceberg lettuce begun earlier this year by the UFW—like the union's successful table-grape boycott several years ago — has once again taken on all the trappings of a relgiious crusade. In fact, however, much more is at stake than just unionism.

Indeed, say some economists, the issue is in part the very structure and future of much of American agriculture. To many experts, forced unionism would profoundly alter much of agriculture as it is now known in the U.S. After the grape boycott, for instance, some growers converted from table grapes to other types of low-labor grape products. Some ceased operations altogether.

To date, Cesar Chavez's United Farm Workers, marching out from their new headquarters at Keene, Calif. (with 58,1000 dues-paying members in 1971) is well on its way toward becoming a major political and social force in both the Western states, and notionally as well. As of late May the union had contracts in six states, California, Arizona, New Mexico, Texas, Colorado and Florida, covering roughly 37 different crops. Underlining the union's political clout. Sen. George McGovern not only endorsed the lettuce boycott at a rally here last May, but hailed Chavez as "one of the greatest living Americans." The Senator said Chavez had been "anointed to bring good news to the poor."

EMOTIONS FLARE—PRO AND CON

Farm unionism is an emotional issue. Passions rise, pro and con. Impartiality is often downright difficult to come by. Definitive statistics are often unavailable to the outside observer. All told, there are roughly 3 million farm workers in the United States —from young children to college students to so-called "migrants" to full-time, professional field hands. Some 270,000, by U.S. Agriculture Department estimates, leave their home counties at some point and thus can be classified as "migrants," the bulk of them working in the Southwestern-Western United States and as far north as Michigan.

Throughout the nation they travel, payment varying from crop to crop, region to region. Their life, well cataloged now by both press and television, is often grim. Unemployment (depending on bad crop

to all non-UFW lettuce grown in the United States. About 90 per cent comes from California and here in Arizona. Of this, about 70 per cent is harvested from contracts with the Teamsters Union — yet is still subject to the UFW boycott.

Top Teamster officials see the UFW boycott of their lettuce as an out-and-out assault on their membership. A number of their contracts in the Salinas Valley are 25 and 30 years old. Some analysts even belive that the Teamsters — their backs increasingly against the wall — may be forced to eventually take on the UFW in a jurisdictional battle.

To date, the UFW has six contracts, representing about 5 per cent of production. The remainder, about 25 per cent, is harvested by non-union pickers.

SECRET BALLOTING REJECTED

Although the union now represents only about 2,000 out of the state's 30,000 or so field workers, top Arizona Farm Bureau officials believe that one main upshot will be to drive producers toward mechanization.

Whatever their reasons, Chavez and his union consistently refuse the secret ballot in union elections, though some contracts were ratified after signature. Indeed, in one incident, where a secret ballot was held under supervision of the Federal Mediation and Concilation Service, Chavez was overwhelmingly defeated. For that reason, critics assert, the UFW continues to favor a closed-shop type of agreement whereby the grower signs a contract directly with the union and the union then handles all work passes. Thus, in Florida, Coca-Cola signed over some 1,200 farm workers en masse at its Minute Maid properties.

For its part, the market-oriented American Farm Bureau Federation, through its state bureaus, is actively supporting state legislation outlawing secondary boycotts and promoting secret elections for farm workers. Five states now have such laws: Idaho, Texas, Wisconsin, Kansas and Arizona. A similar bill was passed in Oregon but subsequently vetoed by Republican Gov. Tom McCall. Bills have been introduced or mulled in Colorado, Washington, New York, Wyoming, California (the latter, by a voter initiative). A somewhat similar bill is also under consideration on the national level but is given little chance for congressional pass-

Serve Fruits in Appetizing Ways Each Day

Most nutritionists agree that four or more servings of fruits and-or vegetables are needed daily and these are some of the appetizing ways to include fruit in the daily menu. Fruit sherbet is a welcome coldness when eating hot entrees. It's made with fruit juices and milk and so adds not only the tart taste of fruit but also the nutrients in the milk.

Baked bananas (baked in or our of their skins) when sprinkled with zippy lemon juice also go well with most any entree; banana fritters are fine with ham or sausage. Baked or fried apple slices or quarters, seasoned with spices and lemon juice, can be served with all entrees.

COUNTRY or POP STEREO ALBUM $1.00

$4.98 COMPARATIVE VALUE

Order your choice by sending $1.00 plus labels from any 3 Texize products below.

JOHNNY CASH "Cottonfields Back Home"
TAMMY WYNETTE "Gentle On My Mind"
RAY PRICE "Heartaches by the Number"
CHUCK WAGON GANG "I'm Looking for a Home"

Some 270,000, by U.S. Agriculture Department estimates, leave their home counties at some point and thus can be classified as "migrants," the bulk of them working in the Southwestern-Western United States and as far north as Michigan.

Throughout the nation they travel, payment varying from crop to crop, region to region. Their life, well cataloged now by both press and television, is often grim. Unemployment (depending on bad crop years) and underemployment recur, while farm workers as a whole find themselves more and more displaced by sweeping technological advances on the farm. (800,000 fiield workers alone were displaced between 1950 and 1970.) In many states workers find themselves excluded from jobless benefits and workmen's compensation for injuries, while child labor — perhaps the bane of the profession — continues unabated.

Looking ahead, experts argue that farm unionism is most likely to strike deep roots in the Southwest and parts of the South, such as Florida, where large labor forces are required. The corn belt, wheat and cattle areas, on the other hand, where smaller "field forces" are required, offer little inducement to organizing, though Chavez himself concedes a beginning organization in Ohio and Michigan. Some observers believe that Chavez even envisions eventually moving into norther Midwest "small-farm" areas.

CORPORATIONS HOLD SWAY

Though some farm officials says unionism would just plain destroy agriculture by eventually curbing the economic muscle of the "family farm," studies establish that most farm field laborers continue to be employed by large family units and giant corporate interestes. At the same time, some 93 per cent of all farms (according to a 1970 Agriculture department study) hired either no laborer or what amounted to less than one hired hand for a year.

For now, the main issue is whether or not Chavez can succeed with the lettuce boycott, now extended to about 40 cities, while consolidating and holding previous contracts despite rising criticism from some farm workers themselves. Despite UFW zeal, the lettuce boycott appears to be meeting far less enthusiasm at the marketplace than was the case with the table grapes — notwithstanding all the fervent endorsements on national television during roll-calls and by sign-waving at the Democratic national convention in Miami Beach.

Efforts to organize farm workers long antedate Chavez. As far back as 1946 the American Federation of Labor charted the National Farm Labor Union. The effort failed however, as most strikes were broken either by court-ordered injunctions, use of alien labor or, occasionally, by brutal police action.

Under the National Labor Relations Act and the subsequent Taft-Hartley and Landrum Griffin Acts, farm workers are specifically prohibited from the right to strike and bargain collectively. For growers, though, that means not being protected from illegal strikes or secondary boycotts; both outlawed in industry.

SOCIAL RELIGIOUS CONNOTATIONS

The UFW continues to dismay critics, both by its virility and momentum, and for its social, political, and religious connotations (the banner of the Virgin of Guadaloup is in almost every street procession). The UFW also promotes consumer co-ops, credit unions, and medical clinics, as well as better living and educational facilities for farm workers.

The current UFW boycott now extends some 1,200 farm workers en masse at its Minute Maid properties.

For its part, the market-oriented American Farm Bureau Federation, through its state bureaus, is actively supporting state legislation outlawing secondary boycotts and promoting secret elections for farm workers. Five states now have such laws: Idaho, Texas, Wisconsin, Kansas and Arizona. A similar bill was passed in Oregon but subsequently vetoed by Republican Gov. Tom McCall. Bills have been introduced or mulled in Colorado, Washington, New York, Wyoming, California (the latter, by a voter initiative). A somewhat similar bill is also under consideration on the national level but is given little chance for congressional passage at this time.

RECALL EFFORT PUSHED

Through no Arizona governor has ever been recalled, the UFW is pushing a recall against Republican Gov. John R. Williams for his part in passage of the new Arizona law, which became effective this month. The measure considered a "model" by anti-UFW groups, outlaws the secondary boycott, provides for an impartial labor-relations board to supervise union elections, ensures secret balloting, and provides growers with the option of obtaining a 10-day injunction at harvest time. There would then be a compulsory and binding arbitration. The UFW argues that the mere presence in Arizona of large numbers of alleged Mexican nationals would give growers control of the "secret elections," while undercutting their strike effectiveness by the 10-day injunction.

Drive out to Phoenix UFW offices at Santa Rita Church with national organization director Jim Drake, and you quickly sense the fervor of "La Causa." Dozens of Chicanos mill about, many of them young, in animated discussion, or working on the recall drive. Posters and revolutionary handbills dot the walls.

"Will the recall succeed?" organizer Drake is asked.

"The odds," he says slowly, weighing each word, "are about even. They (the growers) have all the money and the entrenched power. We've got the time. Those are the kinds of odds we like."

For their part, however, top state officials, as well as the growers themselves, expect the recall effort to fail.

As we talk, a pretty, articulate young Phoenix schoolteacher who identifies herself as Pam Regan (not her real name) comes toward us. Though voting for President Nixon four years ago, the young woman (who has heard of the boycott from her students) has decided that she can no longer just sit by. "I've watched this thing now for months. I've just got to help," she says.

Several days later: flying a commercial 727 jet above Phoenix toward Chicago, this reporter remembers that small incident with Pam Regan — and the charismatic appeal of the UFW. The union tactic is simple: Chip away middle class, middle-ground support and polarize the community into two camps.

Many analysts believe that the anti-Chavez growers of the Southwest, whatever the merits of their case, have had difficulty in communicating their viewpoint to the general public. The growers have discovered again and again that it is difficult to dramatize protecting the status quo against a movement which has the public image of a "crusade."

For the antagonists — Pam Regan, Jim Drake, organizer Rudy Tarazan of the UFW, the Teamsters Union, and the apprehensive officers of the Arizona Farm Bureau, as well as the growers of Arizona — the issue of agricultural unionism has become wrapped in the mantle of a self-righteous war of "good versus bad." But behind the emotionalism and the rhetoric, the very structure and well-being of much of American agriculture may be at issue. About that, too few questions are being asked.

Dear Friend:

As a person interested in the problems of migrant farm labor, I am sending you a copy of "The Migrant Farm Labor in America" which contains a good summary of the most information in this area.

I am doing this at the suggestion of the Wisconsin Citizens Committee on Migrant Labor which is concerned about the welfare of these people.

Sincerely,

Henry S. Reuss

March 14, 1966

Dear Friend:

Enclosed is a moving account of a grass roots effort by some 5,000 agricultural workers to secure rights that workers in other industries have had for decades.

Thousands of grape pickers in the Delano area of California have been striking for higher wages and union recognition for six months.

This pictorial report, The Grape Strike, describes the issues at stake in Delano and shows why a million and a half hard-working Americans demand lives of dignity based upon economic independence.

We ask your help in distributing this report among individuals and organizations concerned with the problems of farm labor.

Sincerely,

Frank P. Graham

An Up-From-Poverty Wage

The Fair Labor Standards Act has been revised several times since its original passage in 1938, but it still covers only about half of the workers who are employed for a wage or salary. Now dormant in the House of Representatives is a bill to increase the present minimum wage from $1.25 an hour to $1.75 over a period of years and to extend the law's coverage to eight million additional workers.

The Democratic leaders in the House are not pushing the bill, because their private count suggests that they could not beat off crippling amendments to the bill in its present form. There is also dissension within the Administration on the issue. Although Secretary of Labor Wirtz joins organized labor in strongly supporting a higher minimum, the Council of Economic Advisers fears that too sharp an increase may spur inflation.

The council's concern does not center on the lowest-paid workers, who would be immediately affected and whose claim to an increase is undeniably just, but rather on other workers all the way up the pay scale who would clamor for fresh increases to maintain their relative advantage. Their demands would not necessarily be just but they would be hard to resist and would be inflationary.

Some economists argue that a higher minimum wage and wider coverage tend to squeeze out marginal firms and to speed up the move toward automation wherever feasible. These adverse effects hit hardest at the unskilled workers and the teen-agers looking for work, two groups the Government is trying to help. However, these side effects would be diminished if trade unions relaxed their opposition to indirect Government subsidies to marginal firms in the form of training grants and other help for their employes.

Sentiment on Capitol Hill appears to be moving toward a sensible compromise that would raise the minimum in two stages, first to $1.40 and then to $1.60. Such an increase would bring help to the low-paid workers who imperatively need it without setting off a sharp wage rise all along the line. In any event, the conflict over the exact size of the increase should not obscure the necessity for extending coverage, particularly to the long-exploited agricultural laborers. It is a disgrace that many thousands of full-time workers still earn wages so low they require public relief payments to feed and house their families.

Program Provides Off-Season Employment For Farm Labor

agri SDN 2/16/66

STONEVILLE, Miss (Special) — More than 6,600 Mississippi farm workers were routed to 17 states for off-season agricultural employment in 1965 through a program that was developed by Delta Council and the Mississippi Employment Service.

Aimed at providing additional job opportunities for seasonal farm workers on an off-season basis, the program was initiated in 1950 when Delta farmers, Delta Council officials and Mississippi Employment Service representatives met with Florida fruit and vegetable growers.

The out-of-state movement of farm workers developed from these meetings was recognized as the first organized effort of its kind in the United States and served as a pattern for an expanded program that now routes Mississippi workers to Arkansas, Connecticut, Indiana, Kentucky, Louisiana, Massachusetts, Michigan, New Jersey, New York, North Carolina, Ohio, Pennsylvania, South Carolina, Texas, Virginia and Wisconsin.

ON FLORIDA FARMS

Reporting on the program, B. F. Smith, executive vice president of Delta Council, said that 2,024 Delta farm workers were in Florida at the present time employed in citrus fruits and vegetables.

Workers for the program are recruited through local offices of the Mississippi Employment Service. They are interviewed, furnished with information concerning skills needed in the kind of work they will be performing, and in some cases they are shown training films.

Crews are then routed to prearranged destinations in demand area where arrangements have been made with employers. Government inspected housing is provided and some family groups and college students participate in the program.

Smith said that the state employment services in both supply and demand areas have done an outstanding job and that every able-bodied worker desiring a job is offered the opportunity to participate in the program. Radio announcements, newspaper advertisements and handbills are used to acquaint workers with job opportunities.

In 1964, 5,754 Mississippi farm workers were routed to 19 states for seasonal farm work and earned an estimated $3,740,000. More than 5,000 state farm workers have participated in the program each year since 1954. Most of these workers have returned to Mississippi after the end of the work season.

Smith said that underutilization of agricultural workers during off seasons is common throughout agricultural areas and that the program had been originally initiated to help provide longer periods of employment for Mississippi farm workers who were interested in earning more income.

"The program has also helped the economy of demand areas by providing seasonal labor that is needed to cultivate and harvest crops," Smith said.

SOUTH COUNTY SCENE

WENDY ROGERS

Viet Nam's Far Away

"One big reason so many young people today go around carrying placards against the war in Viet Nam is to cover up that yellow streak down their backs."

"It's amazing to me how these young people can spout so profoundly about the horrors of war without having any real idea of what it is like."

These comments were made locally during the past week by disgusted adults.

And there is the recent case in a neighboring county in which annulment proceedings were initiated on grounds that the husband's sole purpose in getting married was to avoid being drafted.

No harsh words are needed. Such an act speaks for itself.

★ ★ ★

YET FOR every publicity-seeking draft card burner, for every draft dodger who ducks behind a placard, there are the thousands who do respond to the call to duty, who, whether they like it or not, or whether they are scared or not, are prepared to serve. And, there are even some protesters who are sincere in their beliefs, right or wrong, who cannot be classed with the "cowards."

But while adult America's criticism is so frequently turned on the young "way-outs," in this tragic situation, there could be substantially more self-scrutiny on the part of the adults who are so quick to condemn the attitudes of others.

It is easy to criticize others, and easier still not to become personally involved in something that seems

Intensive Care Unit Is Opened by Hospital

By TOM SMITH
WPB Bureau Chief

ATLANTIS — An intensive care unit with lifesaving heart-monitoring equipment for the critically ill is now in operation at the new John F. Kennedy Memorial Hospital.

The unit has 10 beds, one of the largest in this area. Already, eight beds are occupied — and hospital officials say the lives of several patients have been saved by the modern electronic equipment.

One machine, the cardiac monitor commonly called "the Pacemaker," checks the rapidity and [illegible] of heart

helped develop the techniques used in the Lown Cardioverter.

According to Dr. Lown, 450,000 people die each year of coronary occlusion, commonly called heart attack. He says monitoring equipment in all hospitals would save 45,000 critical heart patients annually.

In a study at a Philadelphia hospital, 10.8 per cent of the patients in a section using monitoring equipment died, while in other sections of the hospital 21.7 per cent died.

At JFK Hospital, the intensive care unit is staffed by specially trained nurses. The costs to the patient are higher than in other wards of the hospital. Hospital rules for this unit are also more stringent.

No flowers or gifts can be delivered to a patient. Smoking is forbidden. No radios or television sets are allowed because of the noise and confusion, and also because of the lack of space in the intensive care unit. Relatives of patients may visit only for five-minute periods every two hours.

DARE Report Updated

Growers Facing Major Problems

Machines And Labor Big Issues

By JOHN VAN GIESON
Herald Staff Writer

BELLE GLADE — Farm labor problems are among the major problems forecast for Florida growers over the next nine years by a University of Florida Agricultural Extension Service agent.

F. F. Jamison, head of the service's vegetable program of the Developing Agricultural Resources Effectively Committee, said, however, that no problems facing Florida growers appear serious enough to prevent steady growth to 1975.

Speaking at a Vegetable Field Day at the Everglades Experimental Station, Jamison updated a 1964 DARE report on statewide conditions for about 200 growers.

He said these would be the major problem areas facing them until 1975, the period covered by the DARE study:

MECHANIZATION — "The decrease in the availability of labor and increasing costs means there is a need to develop additional mechanical equipment. Harvesting is an area that has been mentioned, but I would not exclude other production areas."

Jamison said many problems of developing mechanical harvesting can be solved by the creation of strains of vegetables better adapted to machines.

Its proponents say better color reception is one of CATV's [illegible]

are scared or not, are prepared to serve. And, there are even some protesters who are sincere in their beliefs, right or wrong, who cannot be classed with the "cowards."

But while adult America's criticism is so frequently turned on the young "wayouts," in this tragic situation, there could be substantially more self-scrutiny on the part of the adults who are so quick to condemn the attitudes of others.

It is easy to criticize others, and easier still not to become personally involved in something that seems very far away from "home."

At the last City Council meeting in Boynton Beach, the chamber was full of people.

★ ★ ★

THERE WERE plenty of people, for example, to stand up and say how vital it was to them that such-and-such a project should not be passed because they didn't want more traffic going by their house, because they didn't want their business to suffer from the opening of a nearby street, because they didn't want to even think about the long-range possibility that commercial structures could arise near them.

Whether they were right or wrong is not the point. But, the people were concerned about something that affected them personally, about something "close to home."

Many, then, were also present to hear Marine Major Frank Chase of West Palm Beach show a film on how the casualties of Viet Nam, the dead and the wounded, are brought quickly home, how "the chances of a boy getting home in good shape are a lot better now." The young Marine who ran the projector for the showing was soon going to Viet Nam Maj. Chase noted.

★ ★ ★

THE MAJOR was wearing a black arm band that night, to commemorate the death of the city's first war casualty in Viet Nam.

He told the people of all that is being done in this war to help our fighting men. And he told them, without making a "sales pitch," about the Marines' "civic action" program, in cooperation with C.A.R.E., which helps the people of Viet Nam, but which also, indirectly, helps the U.S. soldier.

Such help, he said, may make the difference between a patrol being ambushed, and being warned of the presence of the enemy. In fact, he said, there is proof that soldiers' lives have been saved as a result of help through the program.

Worth at least checking into, wouldn't you say?

Of all those at the meeting, only three persons were interested enough to check.

Comic Dictionary

Baptist College

Fund Drive Moves To Belle Glade

Herald Bureau

BELLE GLADE — The Baptist College Fund will launch a local fund raising drive here Tuesday.

Dr. Donald E. Warren of West Palm Beach, executive chairman of the fund campaign and newly elected president of the Florida Heart Association will speak at a luncheon at the Belle Glade Country Club to initiate the drive.

The county-wide campaign to raise $1.5 million for the college at Palm Beach Gardens has passed the half way mark. When the goal is reached, the Florida Baptist Convention is pledged to activate a board of trustees and name a president for the college. A state-wide campaign to raise an additional $1 million is scheduled for 1967.

—Herald Photo by MAURICE HOLLEY JR.

Is That Clear?

This sign is one of the results of a gambling crackdown instigated by recent Grand Jury reports and recommendations, and being carried out by police and the sheriff's department. The sign is prominently displayed over the doorway to a migrant workers' dining room in a camp west of Delray Beach. The camps were singled out by the Grand Jury reports as nests of bolita and Cuba lotteries and weekend card games are normally prevalent.

He said these would be the major problem areas facing them until 1975, the period covered by the DARE study:

MECHANIZATION — "The decrease in the availability of labor and increasing costs means there is a need to develop additional mechanical equipment. Harvesting is an area that has been mentioned, but I would not exclude other production areas."

Jamison said many problems of developing mechanical harvesting can be solved by the creation of strains of vegetables better adapted to machines.

LABOR RELATIONS — "There is going to be a continuing need for labor even after we get all these machines. Growers need assistance in recruiting their labor and with their management problems.

"We need training in labor management by many industry men."

CANNING and frozen foods — "we should examine processing closely even though this is going to continue to be a fresh vegetable market state."

Jamison suggested Florida growers look into the economics of processing to see if it is a feasible market for their produce.

POLLUTION — "In specific locations this is a serious problem. If present pollution problems are not solved several of our major producing areas will be forced out of production."

Jamison said these problems were all listed in the 1964 report but the DARE committee felt they should be re-emphasized now.

He said the progress forecast in 1975 by the DARE report looks, after only two years, as though it may have been conservatively estimated.

The DARE committee report estimated total value of products shipped from the state to rise from $200 million in the base year, 1960, to $303 million by 1975. But in 1965 that figure had already reached $250 million.

He said Florida will grow as a vegetable market despite an apparent national decline in per capita vegetable consumption, and this now makes the 1975 estimate look conservative.

"The per capita consumption is going down for most vegetables but in the period from November through April the per capita consumption is not going down, it's going up. It's 15 per cent higher than it was in 1940."

He pointed out that the November to April period is the peak marketing time for Florida vegetables.

Deans to Arrive For Workshop

A Look at 'Super TV' --What It Means to You

By ROBERT RENO
Herald Staff Writer

The Miami Herald
FILLS IN THE BACKGROUND

WEST PALM BEACH — Local viewers may soon have several more choices on their television dials if the city grants approval for a new system of "super television."

At least four firms are in the running for a city franchise to build and operate a community antenna television service in West Palm Beach, and for the first time indicated it may grant one.

Subscribers to the service would pay about $5 a month for "super television" which would assure perfect reception of all local and Miami stations. On the remaining seven empty channels they could receive FM music, 24-hour weather reports, stock market quotations or anything else the system desires to transmit within certain FCC-imposed limitations.

Cables attached to existing utility poles would bring the service to each home. It would be a voluntary service. Anyone who wanted to keep on using their TV antenna could do so.

Community antenna systems are already in wide use in areas where normal TV reception is difficult or impossible. These include cities in mountainous regions or others, like Naples and Key West, who are remote from major cities where TV stations are concentrated.

Although West Palm Beach is not such a fringe area, promoters of CATV believe it has a market here. They claim it would give clearer reception of Miami TV stations than local viewers now receive from rooftop antennas. It would also, they say, put the "empty" channels to use with music, weather reports or other special services.

Although a local system could be expected to branch out into other municipalities and unincorporated areas of the county, it would start in West Palm Beach and the City Commission's nod is necessary for a franchise.

Besides improving TV pictures in the West Palm Beach area, CATV proponents say it could bring some stations to the North County-Jupiter areas which cannot be received clearly there now.

Officials of the county's own television stations, while not publicly opposing the plan, do not hide their aversion to CATV. It would increase their competition from Miami stations. With CATV, local viewers would receive Miami stations as clearly as they now receive WPTV in Palm Beach and WEAT-TV in West Palm Beach.

CATV systems have recently been brought under increasing control by the FCC which wants to assure that local stations are not discriminated against by CATV operators. It requires that all local stations must be carried by CATV in addition to distant stations.

Another new regulation would prohibit a CATV system here from carrying a program on a Miami station that is being shown simultaneously on WPTV or WEAT-TV. The same program could be carried however if the Miami station were broadcasting in color while the local station wasn't.

Its proponents say better color reception is one of CATV's principal benefits at a time when color sets are becoming more commonplace. It would, they claim, provide perfect color reception from all stations.

The FCC is also trying to stimulate a comeback of UHF stations which have a shorter range than regular VHF stations. The CATV people claim conventional rooftop antennas will not receive UHF stations from out of the county. Licenses have been granted for independent UHF stations in Broward County and in Miami.

When these stations go on the air, CATV would bring them to this area.

Many older sets are not built to receive UHF. But UHF stations could be received over CATV whether or not a set was built for it.

Acting City Manager Bill Tyre says he expects at least four firms to ask for the franchise May 16, the date the commission has set for considering applicants. The commission has not committed itself to grant any franchise but few concrete objections have been voiced so far.

One of them is the additional wires it would bring to the mass of cable already strung through the city.

But the commission is not expected to overlook the additional franchise taxes it would receive from a CATV operator. One applicant claims his system would return $35,000 a year to the city when it is fully operational.

At least two firms have made a strong pitch for the franchise while several others, as yet unidentified, are expected to be in the running.

Gold Coast TV Inc., headed for former Mayor Cy Young of Fort Lauderdale, has been after the franchise for several months. Another is Burnup and Sims Inc., locally based communications contractors with operations throughout the world.

Burnup and Sims claims to be the largest builder of CATV systems in the world. Tom Pledger, operations manager of the firm's CATV division, says it has built more than a dozen systems in northern cities but does not yet own or operate any of its own.

He said Burnup and Sims already holds CATV franchises in the cities of Lake Park and North Palm Beach and plans to build systems there regardless of whether it gets the West Palm Beach franchise.

Migrant Labor - Fla

MIGRANT LABOR

"ON THE SEASON" FOR FLORIDA MIGRANT FAMILIES

by BETTY AUSTIN

For two hot dusty days in June I rode through the Old Trap Road area near Elizabeth City and through closely cultivated and well cared-for tobacco, corn, and potato fields near New Bern, North Carolina. With C. H. Mayer and Jimmy Pollard, field staff of the AFSC Migrant Leadership Training Project, I was visiting Florida migrant crews. These were crews "on the season" to which the Service Committee's migrant project relates.

The crews are in these areas three or four weeks grading and picking up potatoes and gathering corn and green beans. They will then move north, some of the crews to North Collins near Buffalo, others to Utica, New York. Crews have been leaving Florida since mid-June and will return there some time during September after school has started. They are approximately four months away from home.

Marvin Johnson is a tall powerfully built capable crew leader. He was standing quietly in front of his quarters, dark grey hat square on his head, the day we were there. The crew had arrived in New Bern two days before and was ready to work in the potato fields. Later in the week an AFSC program aide, also a Florida migrant, was joining his crew. The aide's work is to assist the members of the crew in using the services available to them in local communities.

C. H. Mayer and Jimmy Pollard, AFSC field staff, visit migrant crew near New Bern, North Carolina.

Children in migrant camp near New Bern, North Carolina.

Adult members of the migrant families began working in the potato fields that week, getting 10 cents for each 100 pound bag picked up.

The weather and the market affect the number of days per week that they can work, making a dependable income impossible. Next year almost all of the potatoes will be mechanically picked and there will be little work in that area for migrants in the fields. There will be some work at the graders, the machines where the potatoes are sorted, graded and packed in bags for shipment.

We visited a large migrant camp near Elizabeth City one evening, and talked with the program aide working with the crew members. She was recording social security numbers for all members of the crew to insure that proper records be kept and that social security payments would be made.

The children from this camp were picked up by bus early each morning and taken to a near-by school which had a Headstart program. They were given breakfast, mid-morning snack, lunch and afternoon snack. They were returned to the camp at about the time their parents came in from the fields.

Often the migrant worker himself does not eat breakfast. He may have only a carbonated drink for lunch. In the evenings families have simple meals, often fish and fried potatoes. They cook on one or two burner kerosene stoves which they have brought with them from Florida. They do not like the vegetables they pick. Consequently green vegetables are largely missing from their diet.

C. H. Mayer and Jimmy Pollard were warmly welcomed at each camp we visited. They discussed with the leaders and crew members immediate problems and those in the days ahead. To help the migrants define their needs and to assist them in becoming equipped to help themselves are the aims of the project.

Charles Davis Resigns Position

Charles E. Davis has resigned as Director of the School Desegregation Program of the High Point office to accept a position with the Mobility Project of the North Carolina Fund.

During the ten years Charles Davis has been associated with the school desegregation program, the program has sought to encourage school officials and state educational leaders to work toward integration of students in the public schools. It has also aimed at the development of leadership for desegregation at the community level.

For the past two years his work has been with the School Desegregation Task Force, a project jointly sponsored by the AFSC and the NAACP Legal Defense and Educational Fund, Inc. In this capacity, he has worked in communities of Virginia, North Carolina and South Carolina to help Negro parents and students become aware of steps which may be taken to effect transfer of students to desegregated schools under Title VI of the Civil Rights Act.

Most recently, he has supervised summer tutoring projects in Pageland, Barnwell and Ridgeville, South Carolina.

East meets West at Austrian Seminar

A participant at the Austrian seminar complained he could never find anyone interested in taking time to play tennis, and three card players failed the whole week to find a fourth for bridge. Such was the pace and pleasure of 25 young research associates who met at Gars-am-Kamp, Austria, April 20 through 30. Here was an unusual opportunity to tackle topics of common interest without distraction or interruption, so they kept at each other with unprecedented intensity to the exclusion of everything else. Even when the long sessions adjourned, informal discussions continued over coffee in the lounge, during meals, or in the rooms late at night. Long talking-walks and a day's outing were almost the only chosen diversion from seven days of stimulating discussion.

Theme was peace in Europe

"Peace in Europe" was the theme of the seminar. The research associates were from institutes of international affairs, mid-career men between the ages of 30 and 40 who were concerned with exploring practical ways of achieving peace and security in Europe. They arrived from thirteen different countries representing the ideological "East" and "West" and the non-aligned. All were specialists in some phase of the problem and all were well informed.

A spirit of friendliness pervaded the seminar as they searched together for

Seminar participants explore constructive plans for Europe's future.

AFSC promotes change in farm labor practices

Unorganized and inarticulate, migrants go unnoticed, their problems unsolved. Program emphasis is education of workers for leadership. Crew leaders, growers involved.

When killing frost cut down the bean crop in the Pompano, Florida, area last January, the market price of beans jumped from $4 to $8 per hamper, but the wages for the pickers went down from 80¢ to 70¢ per hamper because the frost damage created a surplus of labor. During 1965, 150 potato growers in the Hastings area netted a profit of $13.5 million while the bagger could make a maximum of $4.35 per day packing and lifting.

"We've got nothing to show for a lifetime of work." When AFSC aide Sam Jackson read these words from a National Committee on Farm Labor booklet to a group of migrant field workers, one declared, "That's the whole story in one sentence!"

The Service Committee's community relations staff members say that housing conditions are an accurate reflection of the status of migrants. Workers in Florida often pay $12 a week for a shack so small and miserable that a man can reach from wall to wall by stretching out his arms and can see the ground through the cracks in the floor.

A month or two later, the same workers may be assembling before dawn

The average worker earns an annual income under $915 and works less than 115 days a year.

under Philadelphia's Benjamin Franklin Bridge, where ramshackle yellow buses wait to carry them to adjoining farm areas for a day's work. Here in the big city, while looking for a room he can afford, a man may sleep in some rat-infested condemned house in Hell's Half Acre or buy himself a ticket to oblivion amidst a welter of canned sound effects, curled up in the flickering dark and stale air of one of the city's all-night movie theaters.

This most neglected sector of American society is present one day, when needed by the farmers, and gone and forgotten the next. Unorganized and inexperienced in speaking for themselves, the migrants are unnoticed by urban society. Pressed by social reformers, the Government creaks in its ponderous way toward better legislation for farm laborers, but in the opinion of Service Committee workers like project

continued on page 4

Workers *continued from page 1*

leader Bill Channel, a real reform movement can never get off the ground until the people involved take the leadership. Workers themselves must learn, for example, to look up the health facilities in their neighborhoods, know what inspection laws can be invoked, and be aware of what wages a fair day's labor should bring.

And that is the job the Committee's Migrant Leadership Education Program has begun. This summer, after a nine-week training program, 15 people chosen as potential leaders from 15 groups of migrant workers started "up the road" with their crews. The three-man AFSC field staff moved along with them as they put their new knowledge to work. In each community, the representatives of the more than 100,000 men and women of America's East Coast migrant stream were being met by volunteers, which AFSC workers call "community associates," to help them find solutions to the problems they meet and feel a part of the community.

Problems next year are expected to be even greater. The agricultural economy is the most highly mechanized branch of the national economy and there is enormous potential for further automation. Hank Mayer, erstwhile business agent for the Hod Carriers Union and labor organizer for the United Furniture Workers of America, now one of the program's three field workers, declares that next year there will be little work for migrants in the Elizabeth City and New Bern area of North Carolina, because virtually all the potatoes in that section will be mechanically picked. There will be some work for men at the graders—large machines for sorting potatoes. But migrant workers average under $915 annual income anyway, and already work, on an average, less than 115 days a year. They have the highest percentage of adult illiteracy in the United States, averaging little more than a fourth-grade education. Yet they can and must go a long way toward helping themselves, and the AFSC's test program is geared to encourage and train them to do it.

Crew leaders meet

Effective strides can be made when crew leaders, who direct the actual work and are in a position to bargain with employers, can be involved in a planning program that promises improvements in their own conditions. Here some AFSC efforts fall on poor ground, some on fertile soil. There are crew leaders like Tallahassee Tim (a substitute name), who reportedly has TV in every room in his house and a red Cadillac convertible with four bodyguards, provides radios in all his labor buses, and sells liquor to his workers with a 30% markup. But once in a while there is a helpful person like the one who agreed to plan a meeting for his fellow crew leaders and got 17 of them together within four weeks. The men elected as their chairman the hero of Ed Murrow's "Harvest of Shame," held state-wide meetings, produced a mimeographed labor price list with pickers' rates included, and applied holdout pressure that eventuated in improved wages and even, in some cases, impressed growers.

There are some forward-looking growers, too, like the ones in the New England Apple Council who recognize the desire of the migrant workers for dignity and better wages and realize that housing, education and transportation must also be improved.

Although the AFSC's program is primarily focused on the education of the workers themselves, it finds its efforts enriched and its purposes enhanced when the way opens to work with responsive crew leaders and growers.

CHRISTMAS GIFT PLAN

Honor your friends through the AFSC Christmas Gift Plan. You and those you wish to greet can share the satisfaction of serving people in need at home and abroad. Participate by sending us a list of your friends in whose name you wish to make a gift of not less than a dollar. At Christmas time the Committee will mail those on your list an attractive card inscribed with your name . . . a gift in the spirit of Christmas.

MEMO TO THE FILES

FIELD REPORT, EFV

RE: MIGRANT LABORERS IN FLORIAD

Following conversation with Bill Chandler of AFSC Project in West Palm Beach, Florida and with Jim Pierce, IUD, Southeast Corrdinator, it became apparent that there was some divergence of viewpoint and perhaps some personality conflicts regarding the way to help migrant workers through self-organization. Hank Meyer, working with the AFSC, had been instrumental in assisting crew leaders (labor contractors) in starting an organization of their own. The IUD had a similar interest and had asked members of the Steelworkers staff in Florida and two workers out of steel shops out of Florida to participate in any meetings that were called and to become acquainted with the leadership in what had been incorporated as the United Agricultural Workers of America, Inc., on April 18 under Florida law.

Willie Payne who is with the Steelworkers in Tampa and also the District Civil Rights Chairman and once a migrant laborer himself was one of the local union people used. Carroll Lewis was the other. Pat Burke, the Districst Director, had participated in some meetings as had Estes Riffe who is the Assistant District Director.

Hank Meyer had been the key direct contact person for AFSC and he is working under Bill Chandler. The community action fund of Florida also had an interest in this project. The The Fund is headed by Dr. Pat Hardeman but Bill Johnson of the Fund had worked closely with Hank in direct contact with the crew chiefs. Evidently Roscoe Webb of the Community Action Fund in Dade County had been instrumental in bringing in Attorney Kufman to assist with the by-laws and incorporation papers for the United Agricultural Workers of America, Inc.

Via went to West Palm Beach to meet with Jim Pierce, Estes Riffe, Bill Chandler, and Hank Meyer. The meeting apparently was successful in terms of reconciling the various differences and getting common support for a move to have an IUD-sponsored organizing drive backed by Laborers Union interest and money. Although the first level of the drive would be to organize the crew chiefs first the understanding was that the pickers would also be organized. Current thinking is that they might go into two separate locals but that bargaining would be joint. The key crew chiefs understand that the various groups have a primary interest in the pickers even though the problems of the crew chiefs are quite substantial, especially for those who are honest.

In Belle Glade, Florida, Via ~~km~~ met with Willie Payne and Carroll Lewis as well as the president of the Agricultural Workers of America. Ed King and his vice-president ~~xxx~~ Mr. Larkner (?). The two _____ crew chiefs seemed to be quite delighted that such differences as had existed seemed now to be reconciled. Jim Pierce briefed them in regard to what he would be saying the next evening (May 10) regarding the IUD and labor union interest in them.

RURAL OUTMIGRATION CREATES CRISIS FOR CITIES AND FARMS, SAYS REPORT

NEW YORK--Cutbacks in cotton production, mechanization and discrimination are forcing the migration of hundreds of thousands of people annually from rural to urban ghetto areas, according to a report, The Condition of Farm Workers and Small Farmers in 1965, released today by Fay Bennett, Executive Director of the National Sharecroppers Fund (NSF).

"To meet this deepening crisis," Miss Bennett said, "we need prompt governmental action to provide more equitable crop allotments to the small farmer, vigorous enforcement of anti-discrimination policies in the implementation of farm and other government programs, and large-scale programs to rebuild rural areas as proposed in our report."

NSF's report called for massive remedial programs to raise the living standards of rural people. Specifically, the report cited the need for the building of a million new homes and 30,000 new water and sewage systems, and increased medical, health and educational facilities. Development of these needed programs would create "from a quarter to a half million new jobs," the report asserted.

The report also called for "inclusion of farm workers in all the protections of social legislation that benefit industrial workers" and increased loan and technical assistance to enable small farmers to remain on the land and to raise their income levels.

On the whole, the report indicated that last year hired farm workers fared slightly better economically than marginal farmers. A major gain was the hiring of more domestic farm workers by operators of large corporate farms that were no longer able to secure foreign contract workers under Public Law 78, which had expired.

Other advances cited include several successful union organizing drives and strikes for better wages and other benefits which, the report asserted, "marked a new militancy among farm workers"; and a rise in the average hourly wage paid farm workers from $1.08 to $1.14, "the largest one-year increase since the Korean War."

On the other hand, the report said that mechanization continued to displace thousands of sharecroppers, day laborers and small farmers. The number of Southerners who have quit the farm since 1940 rose to three million last year, the report declared. Displacement of Negroes "was brutally speeded by evictions following voter registration and other civil rights activities," the report charged.

The report indicated disappointment with implementation of the Economic Opportunity Act in the rural South, which it said has "the most impoverished communities" but "received the least antipoverty funds."

The National Sharecroppers Fund is a private, nonprofit organization which helps sharecroppers, tenant and small farmers, and other rural residents in the South take advantage of available federal assistance programs to improve their economic situation. NSF helps them qualify for benefits by providing information and technical assistance, and also works to end discrimination in the implementation of the aid programs.

Former North Carolina Senator Frank P. Graham is NSF Board chairman. A. Philip Randolph, president of the Brotherhood of Sleeping Car Porters, is vice-chairman.

Copies of the report are available from the NSF office, 112 East 19th Street, New York, N.Y. 10003.

Ag. Workers

THE CONDITION OF FARM WORKERS AND SMALL FARMERS IN 1965

REPORT TO THE BOARD OF DIRECTORS OF NATIONAL SHARECROPPERS FUND
by Fay Bennett, Executive Director

"There still lies ahead the establishment for migrant farm labor of the standards of both decency and efficiency which are characteristic of other employment in this country."

Secretary of Labor W. Willard Wirtz in Year of Transition: Seasonal Farm Labor, 1965

"I used to wonder how all my white neighbors got such fine cows and fine pastures and fine tractors. I kept snooping around and I found out my white neighbors were getting loans from the government. My [county] agent hadn't told me that!"

Participant in Alabama Conference on Governmental Anti-Poverty and Other Programs to Aid Low-Income Rural People, co-sponsored by NSF

"I think I've been on strike all my days 'cause I've been suffering all my days. I don't mind suffering . . . Let me suffer till I get to the good . . . . For God's sake stop grumbling and see the thing right."

Mrs. Adkins of Shaw, Mississippi, in statewide Mississippi Freedom Labor Union Meeting, Sept. 4, 1965

The Year in Brief

1965 was a year of transition and hope for hired farm workers, of dispossession and struggle for marginal farmers. The end of dependence on foreign contract workers and the proof that domestic workers were available if jobs met minimum standards characterized the transition. Strike action and union organization marked a new militancy among farm workers. Continued mechanization made thousands of sharecroppers "expendable" and day laborers idle, as economic change was brutally speeded by evictions following voter registration and other civil rights activities. The war on poverty moved into southern rural areas but its pace lagged far behind the national effort.

Fewer and Richer Farms; Fewer and Poorer People

Between 1939 and 1964, 2.4 million farms disappeared; 95 per cent of them were small farms with less than $2,500 in annual gross sales, and about a fourth of them were worked by sharecroppers. Only about 1.5 million small farms are left now. In the same period, the number of farms with gross sales of $10,000 and more rose two and one-half times. In the South, three million people have left the land since 1940. Most of those forced off southern farms have been Negro sharecroppers and tenant farmers who have migrated to northern and western ghetto communities. (At one point they were flocking to the Watts area in Los Angeles at the rate of 1,000 a month.)

The displacement of people from southern farms may be accounted for by many factors. Chief among these is continued mechanization. Mechanical cotton pickers and grain harvesters are eliminating sharecropping in the deep South, leaving only half a million day laborers. In the Delta area, 95 per cent of the cotton will be machine-picked in 1966--in contrast with 69 per cent in 1965--and 20,000 more farm laborers will be made idle. The coming mechanization of tobacco will have a similar effect in states just to the north of the cotton belt. Across the continent in California, about a third of the 1965 tomato crop--116,000 acres--was reaped by 262 machines; in 1966, a major portion of the tomatoes will be planted for machine harvesting.

Hundreds of farmers are being dispossessed in Alabama, Mississippi, and Louisiana for participating in civil rights activities. The dispossession of others will be speeded by the Food and Agriculture Act of 1965; in the Mississippi Delta alone, one-third of the 925,000 cotton acres will be taken out of production.

Productivity continues to rise. The labor of one farm worker supplied the farm product needs of 11 people in 1940, 15 in 1950, 26 in 1960, and 33 in 1964.

Hired Farm Workers

There are about 2.5 million households with one or more members who do some hired farm work during the year. More than half of these live below the poverty level (defined as less than $3,000 income from all sources); in this group are more than 80 per cent of the non-white families, and more than 70 per cent of the families headed by a migrant.

In 1964, the last year for which full figures are available, there were approximately 664,000 full-time farm workers in the United States and about 2.5 million seasonal workers. Of these, about 386,000 were migratory workers and 272,000 of them did 25 or more days' work during the year. In 1964, migrants worked an average of 131 days at farm and nonfarm work and earned an average of $1,240. Nearly half (44 per cent) of them did both farm and nonfarm work with average earnings of $585 at farm work and $1,049 at nonfarm work. Those who did only farm work averaged $935 in annual earnings. A special wage survey made by the Department of Labor in May, 1965, covered 1.5 million farm wage workers. Seventy per cent of them were paid less than $1.25 an hour. More than one-third (in the South, 54 per cent) were paid less than 75 cents an hour.

Safety. The National Safety Council has again branded agriculture as one of the most hazardous of all industries. In 1965, agriculture ranked below only the mining and construction industries in death rate. It had the largest total number of deaths, 3,200, and 270,000 disabling injuries.

Children. More than one-fourth of the entire hired farm working force are young people less than 17 years of age. (In 1962, farm wage worker households with less than $3,000 income included 3 million members not yet 18, about 27 per cent of all children and youth in the poverty sector.) There is as yet no national legislation to prevent child labor in agriculture outside of school hours, as there is in other industries. "Crop vacations" are common from Maine to Louisiana, nullifying the school-hour protection. In the year ending June 30, 1965, Department of Labor inspectors found 2,300 farms violating child labor laws and a total of 7,076 children under 16 working during school hours. More than half of these were in the 10-13 age bracket.

Housing and Health. Despite the existence of new government programs providing financial aid for farm labor housing, too many farm worker families still live in miserable conditions. Investigation into an alleged labor shortage in Florida last spring uncovered these conditions:

> ". . . There are no camps in Dade County with indoor plumbing for each cabin. The electrical outlet provides a bare bulb for light. . . . Sometimes burlap is the only privacy between rooms. The floors and walls are generally bare, unpainted planks. Families with 10 and 12 children can live in one two-room shack for $8 to $10 a week. . . .'A new camp would have to live up to the letter of the law,' says [one] Sanitation Inspector. . . .'That's why there are so few new camps.'"

Small wonder that migrant families are more prone to illness than others; that diarrhea is chronic among children; parasitic and fungal diseases common; neglect of teeth, eye, and ear ailments prevalent.

Foreign Workers. 1965 was the year of transition for farm labor, domestic and foreign. Mexican braceros, always the bulk of foreign contract workers, were no longer available under Public Law 78, which had expired. The challenge of attracting a sufficient number of domestic workers to replace them had to be met and, for the most part, was met. Use of foreign labor was reduced 83 per cent, from 634,000 man-months (equivalent to 52,800 full-time jobs) in 1964, to 110,000 man-months (9,200 jobs) in 1965; Mexican labor was reduced 95 per cent. In 1964, there had been

178,000 Mexican contract workers in 17 states; in 1965, there were 20,300, all in California. The use of British West Indians did not decrease proportionately. In 1964, there were 14,000; in 1965, although there were 14,100 in Florida alone, man-months dropped from 81,000 to 64,000; but there were also 1,340 BWI's working in apples and 800 in tobacco. The number of Canadians imported to New England states dropped from 8,000 in 1964 to 4,484 in 1965--3,627 in potatoes and 857 in apples. Of the 1,080 Japanese and 110 Filipinos in the United States at the end of 1964, 200 Japanese remained by the end of 1965. All of the temporary workers imported in 1965 came in under P. L. 414, the Immigration and Nationality Act.

Average hourly wages for farm workers rose from $1.08 to $1.14, the largest one-year increase since the Korean War. Crop values were up even in the three crops--asparagus, strawberries, and pickle cucumbers--where crop losses may have been attributable in part to labor shortages. The price of fresh fruits and vegetables went down in 1965 (by 4.5 per cent, comparing November, 1964, to November, 1965), while the Consumer Price Index rose 1.7 per cent.

Farm Worker Organization

Large-scale militant union activity among farm workers developed in 1965 in widely separated parts of the country.

Cotton choppers and pickers, paid $2.50 or $3.00 for a 10-hour day, formed 90 per cent of the membership of the Mississippi Freedom Labor Union; but they were joined by tractor drivers, haulers, domestic servants, part-time carpenters, mechanics, handymen, former sharecroppers, and renters. The MFLU demands were for a $1.25 an hour minimum wage, an $8\frac{1}{2}$-hour day with time-and-a-half for overtime, sick pay, health and accident insurance, and equal employment practices. Evicted strikers and croppers set up a tent city. If MFLU cannot bring the huge plantation owners to the bargaining table, it may at least focus national attention on the need for alternatives for the poor people of the cotton country.

The grape strike broke out after Filipino workers returned from Coachella Valley, California, where they had received $1.40 an hour plus an incentive piece rate, to Delano where wages were $1.25 and the incentive smaller. They called for help from the AFL-CIO's Agricultural Workers Organizing Committee. When employers refused to discuss wages, working conditions, and a union contract, between six and eight hundred workers struck. Within two weeks, 1,200 Mexican-Americans, organized in the National Farm Workers Association, joined them. Harrassment and arrests by employers and local authorities were constant. The strike continued from the picking season into pruning, the beginning of the next crop year. (In 1966, Schenley Industries has recognized the union and the Di Giorgio Corporation has suggested an election.)

Other areas were affected. At Lantana, on the East Coast of Florida, 14 farm workers struck, demanding a wage increase, but lost; just south of Lantana a strike was averted when demands were met. A wage increase was secured in the Pompano Beach area by a strike threat coupled with a labor shortage. A five-day strike of 800 British West Indian cane cutters at the Okeelanta Sugar Refinery was lost. The Steelworkers union organized Cypress Gardens Citrus Products, Inc., of Eloise, Florida's largest multi-purpose citrus plant, as the beginning of an organizing drive. In Louisiana, the Fish, Seafood, Agricultural and Allied Workers Union No. 300 secured for Gulf Coast pogy boatmen their first over-all pay increase in 25 years. Local 300, affiliated with the Amalgamated Meat Cutters, includes dairy, sugar, and rice workers in addition to the fishermen.

Legislation

Congress moved slowly in 1965 on bills which proposed coverage for farm workers under minimum wage requirements, child labor regulations, collective bargaining guarantees, and unemployment compensation. Although both Senate and House worked on separate, similar bills, only one piece of legislation--a House proposal to include

farm laborers under minimum wage coverage--was reported favorably out of Committee, but it did not come up for a vote before the session ended. (In March, 1966, a new minimum wage bill was reported favorably out of Committee.) In September, 1965, a proposal to transfer the authority to import foreign workers in times of domestic labor shortage from the Labor Secretary to the Agriculture Secretary was narrowly defeated.

More action was seen in state legislatures than in some years. Five states strengthened regulations governing housing and sanitary conditions. California enacted the first law requiring employers to provide sanitary facilities in the fields. Texas now requires a tuberculosis examination for persons seeking migratory work. Florida and Michigan set safety standards for motor vehicles used to transport migratory workers, and California improved its vehicle code. North Dakota deleted the exemption for agricultural workers from its minimum wage law, but Michigan suspended coverage of certain agricultural operations. New Jersey broadened its wage payment and collection law to include agricultural workers. Maine, Michigan, New Hampshire, and Oregon amended workmen's compensation laws to provide some coverage for agricultural workers.

Federal Programs

Farmers Home Administration. In 1965 FHA loaned more than $798 million to help 12,186 farm families buy, enlarge, or develop farms; gave short-term operating credit to 118,000; assisted more than 12,000 with antipoverty loans; loaned $13 million which provided new or improved housing for more than 5,500 rural persons aged 62 and older; and gave credit assistance to 388 rural communities to construct water systems. Unfortunately, however, generations of discrimination have produced such inequalities that many Negro farmers cannot now meet qualifications for loans. In several Southern states, little change is yet visible. The number of farmers who have applied but not received loans is not known, and others have not even applied either because they do not know how or because they are sure they will be rejected.

ASCS. According to Department of Agriculture reports as of December 30, 1965, in the 1965 Agricultural Stabilization and Conservation Service elections 12,471 Negroes were on the ballot for various offices in 14 southern states. None was elected either member or first alternate to a County Committee but five were elected second alternates. On the Community Committees, 85 were elected regular members, 131 first alternates, and 303 second alternates. Without members on County Committees, Negro farmers still lack the effective representation needed to change traditional discriminatory policies. Reports from Deep South states indicate that in some areas elected Negro members are not being notified of Community Committee meetings or allowed to participate in their activities.

Office of Economic Opportunity. The Economic Opportunity Act of 1964 made possible, under Title III-B, programs for farm workers in education, sanitation, day care, and self-help housing. In 1965, OEO granted some $26 million in Title III-B funds to 65 public and private nonprofit organizations in 20 states. Around 350 VISTA volunteers are working with migrants. Under EOA's rural loan programs, nearly 25,000 rural families received $36.5 million in 13 months (including January, 1966), and in southern states, nearly 40 per cent of the family loans have been made to Negro borrowers. OEO has financed small machinery cooperatives, and more than half of these are made up partly or entirely of Negro farmers. EOA made possible additional projects under Community Action Program auspices, but the most impoverished communities--mainly in the rural South--have received the least antipoverty funds, because they lack the organization and technical help needed to initiate projects.

Training Programs. Since 1962, more than 20,000 persons have been trained in agricultural skills under the Manpower Development and Training Act and the Area Redevelopment Act. Training is also given in basic literacy skills and for nonfarm occupations in areas where workers are needed. Hundreds of thousands are in need of such training as their old agricultural occupations are disappearing.

A Program for Rural America

The crises of American cities and farms, so different on the surface, are inextricably bound together. Dramatic evidence is the annual migration of a million people from rural to urban areas.

Remedial programs are needed to raise the living standards of rural people: inclusion of farm workers in all the protections of social legislation that benefit industrial workers; increased programs of loans and technical assistance to enable small farmers to remain on the land and to raise their income levels.

But beyond that, a program is needed large enough to meet the human needs of the rural areas:

* A million new rural homes are needed in the next ten years, and two and one-half million homes need major repairs.
* Rural medical, hospital, nursing, and dental services must be brought up to urban standards.
* Educational facilities must be increased at least to urban levels, requiring a 40 per cent greater investment in education, including construction of approximately 50,000 new classrooms.
* 30,000 rural town water and sewage systems are needed.

Vocational training and remedial education are needed to equip people for employment in these construction and development projects. The training of professionals to staff increased facilities will call for a steadily expanding number of educators and educational institutions. Following the basic medical and educational services should come a host of other social, cultural, and recreational facilities and personnel.

From a quarter to a half million new jobs could be created to meet the basic and expanding needs of the rural areas. On the basis of the new job-created incomes, the disappearing small towns of stagnating rural economies will become thriving small cities with new needs, new construction, new business, in a spiraling cycle of activity.

National Sharecroppers Fund

*has field representatives in Alabama, Arkansas, Florida, Georgia, Louisiana, Mississippi, South Carolina, and Tennessee, helping poverty-stricken people to help themselves, bringing knowledge of federal assistance programs available, and working to end discrimination in their implementation. (Four representatives work under the Rural Advancement Project, NSF's cooperative program with the Southern Regional Council and the State Councils on Human Relations.)

*set up the Southern Rural Training Project under contract with the Department of Labor to stimulate and develop training programs for the hard-core rural poor.

*carried on a crash five-month Farm Labor Counseling Program to advise unemployed rural poor about criteria farm jobs, training opportunities, and other means of increasing their employability and income.

*works to end the exclusion of agricultural workers from the protections and benefits of social legislation that other workers enjoy, and to protect them from the unfair competition of foreign contract labor.

*supports the efforts of farm workers in organizing unions and low-income farmers in organizing cooperatives.

*works with government and other private agencies to help low-income rural people secure a better life.

Migrant Labor

20,000 Texans Join March on Capitol

AUSTIN, Tex.—Twenty thousand Texans marched to the state capitol here Labor Day to demand a $1.25 state minimum wage law and to show their sympathy for a band of farm workers who had walked 400 miles from the Rio Grande Valley to dramatize their low wages and their strike against two corporation farms.

They also wanted to show the state's conservative Democratic organization that many Texans were ready for massive socio-economic changes.

At a barbecue that followed, Pres. H. S. Hank Brown of the Texas AFL-CIO, which collected more than $16,000 from unions to sustain the marchers and the farm strike and which arranged the Labor Day march and rally, said, "This is Texas labor's greatest day."

Only five days before, Gov. John Connally, accompanied by State Atty. Gen. Waggoner Carr, who is a candidate for U.S. Senate, had met the farm workers' march 50 miles from their destination, urging them not to go on.

"There might be trouble," Connally warned.

There was none. As the biggest protest march in modern Texas history moved the last three miles to the state capitol grounds, Texas Democratic Sen. Ralph W. Yarborough, a member of the Senate Labor Committee, joined the march.

From the steps of the capitol, Yarborough told the workers, who had come from all over Texas, "A hundred years ago we ended physical slavery. We are here today to end economic slavery.

"Texas has more people living at the poverty level than any other state. We are here today to lift Texans out of poverty."

Speaker after speaker said that the rally was just the start of a movement to change things.

William J. Kircher, director of organization of the national AFL-CIO, who walked the last days of the march, said:

"These campesinos (farm hands) are setting a good example for all working Texans who do not belong to a union—and only 10 percent of the work force does."

The United Farm Workers Organizing Committee, recently chartered by the AFL-CIO, is "the most significant event for organized labor in recent years," Eugene Nelson said.

Nelson, who served as a picket captain in the Delano, Calif., grape pickers strike, brought what he learned there to South Texas, where he organized the second UFWOC group in the country and then led 40 marchers for 56 days half way across Texas. He said:

"It's a cold and grotesque paradox that the people who produce the food—the vital substance—live under the worst conditions of any employee group in the country."

Cesar Chavez, a leader of the newly-chartered UFWOC, who helped direct the Delano grape strike, told the union members that the unions had "taught the growers of California a few lessons in collective bargaining."

Most of the marchers returned to the Rio Grande Valley the next day to continue their strike, leaving behind two men on the capitol steps, one holding a metal religious cross and the other holding flags of America and Texas.

They, and alternates, were to remain there, silent each day, until the legislature passes a law setting a wage floor of $1.25 an hour for all the workers of Texas, including farm hands.

ENTERING THE GROUNDS of the state capitol at Austin, Tex., to press demand for a $1.25 minimum wage law are striking farm workers from the Rio Grande Valley who had marched 400 miles across the state to dramatize their plight—and some 20,000 other Texans, many of them union members, who had joined them near capitol.

The Farm Worker Goes Union

Some union organizing drives that began as long ago as the Thirties are being completed these days. Only recently New York's taxicab drivers won union contracts, climaxing 30-year-long efforts to organize. Just a few years ago, it was the turn of hospital workers in various parts of the country, a drive sparked by RWDSU Local 1199's successful campaign in New York and New Jersey.

Now agricultural workers are coming into the labor movement. On this page are reports from Texas and California, where America's poorest and most exploited workers are banding together under the banner of the AFL-CIO to win first-class citizenship.

There's still a long way to go before the labor movement achieves its goal of organizing all workers — and particularly such groups as farm laborers. But the campaign is on, and it's gaining strength every day.

EVERYBODY WAS HAPPY when AFL-CIO Pres. George Meany presented a charter to the new United Farm Workers Organizing Committee, formed by merger of the AFL-CIO Agricultural Workers Organizing Committee and unaffiliated Nat'l Farm Workers Assn. With Meany are (from left) AFL-CIO Org. Dir. William L. Kircher and [illegible] Chavez, leader of new

Calif. Farm Workers Win DiGiorgio Vote

SAN FRANCISCO (PAI) — Contract talks are expected to get underway soon between the AFL-CIO's United Farm Workers Organizing Committee and the giant DiGiorgio Corporation covering some 1,400 farm hands on two California farms.

The UFWOC has been officially declared the winner in a contest with the Int'l Brotherhood of Teamsters. The final vote gave the AFL-CIO unit 530 votes to 331 for the IBT. There were two "no union" votes. A total of 1,349 ballots were cast.

The Teamsters were declared winners of a smaller unit of packingshed workers and drivers, 94 to 43.

Under a previous agreement, if the contracts are not negotiated within 45 days all unresolved issues will be submitted to mediation.

THE RESULTS of the collective bargaining election for field workers at two major farms of the DiGiorgio Corp. in California were announced by a smiling Cesar Chavez, leader of the newly-formed AFL-CIO United Farm Workers Committee, as AFL-CIO Org. Dir. William L. Kircher stood by. The final tally showed 530 votes for the AFL-CIO to 331 for the Teamsters. DiGiorgio victory follows contract won at Schenley Products Corp.

Boss Men

Migrant Workers Find Their Lives Controlled By Farm Crew Leaders

Some Overseers Get $50,000 A Year; Keeping Workers In Debt a Common Tactic

A Little Wine, Much Work

By JAMES MACGREGOR
Staff Reporter of THE WALL STREET JOURNAL

EASTVILLE, Va.—It was a long, hard summer for the vegetable growers of Northampton County, what with low prices, a drought that hurt early strawberries and cabbages and, finally, 17 consecutive days of thundershowers. To cut their losses, some farmers let whole fields of waterlogged potatoes and tomatoes go unpicked.

The farmers aren't the only victims, however. Abandoned crops also mean hard times for the Negro migrant workers who pick crops every summer on Virginia's flat, sandy Eastern Shore. Some have found only two or three days work a week this year. Others, working more regularly, are making less money than usual, because muddy fields make vegetables hard to pick.

"I can't recall a year as bad as this one," says Leon James, a 40-year-old Negro who has been traveling here from Florida for the harvest for two decades. While disappointed, Mr. James doesn't seem to be particularly worried, and with some reason. He is neither farmer nor worker.

This is the first of two stories on the migrant farm workers—most of them from the south—who work each year on the harvests in the Middle Atlantic and Midwestern states.

Mr. James is a migrant worker crew leader, officially called a "farm labor contractor." Vegetable farmers here, in Florida and New Jersey pay crew leaders such as Mr. James for recruiting, transporting, paying and supervising the Negro workers who pick or grade the crops. In good years and bad, farmers need migrant workers—supplied by the labor contractors. Startlingly enough, in good years a crew leader can make up to $50,000. Farmers here contend that this year the crew leaders "are the only ones even breaking even in farming."

Mr. James says he will be lucky to clear $200 a week in Virginia this summer. But, back home in Fort Lauderdale, Mr. James and his brother Louis have "a few investments" which, he says with a thin smile, "ought to see us through." They include three small apartment buildings, a fleet of 16 taxicabs and a bus service that delivers domestics to and from work. The seed money for these businesses came from the migrant worker enterprise.

The crew leader is a singular figure in American agriculture. To many a farmer he is indispensable, as the primary—or only—source of labor at harvest time. To the worker he employs, he is an absolute authority. In the labor camp, the crew leader is foreman, paymaster, Dutch uncle, money lender, grocer, policeman, judge and jury. Police and other local authorities leave the operation of the shabby, isolated labor camps almost entirely to the crew leaders.

The Ways of Power

Wielding that kind of power, crew leaders live very well indeed. Most are former field hands themselves. At best, the crew leader seems to be a benevolent despot, using his control of work, money, housing and transport for the benefit of his workers as well as himself. As crew leaders go, Mr. James is favorably regarded.

But Harvey Robuck, a thin, weathered Negro of 32 in another crew, is unhappy about his crew leader. "He picked me up in Bonita (Florida), where I was drunk at the time," says Mr. Robuck. "When we got to this place, he told me I owed him for driving me up here and for my keep. Then I had to borrow some dollars so I could eat and buy a little wine. Then comes Saturday, and he says I only got $4 coming. Five days I worked, and I only got $4 coming. I went out and had me a good time, and Monday I got to borrow a few more dollars."

Mr. Robuck finds himself trapped in the migrant debt cycle. Only the crew leader can find him work or give him a ride back to Florida. The crew leader also has him constantly in debt, furnishing wine and cigarets on credit ($1.50 for an 89-cent bottle of port and 50 cents for a 35-cent pack of cigarets). The crew leader's two assistants have warned Mr. Robuck that he will be "cut bad" (with a knife) if he tries to leave the camp while he owes money.

Better Than Most

Mr. James says he doesn't operate that way. His workers get $1.50 an hour, average for potato graders. And he shuns the petty usury and wine sales used by some crew leaders to inflate their incomes. Nor does he charge for lodgings and transportation to the fields, as some leaders do.

His workers also enjoy relative comfort and sanitation. They live in a red cinder-block compound put up by Eastville farmer Rob Hoeffner at a cost of $30,000 last year. Mr. Hoeffner employs the James crew each year. The compound replaced an old, dilapidated labor camp. The Spartan 10-foot-by-12-foot rooms are no cozier than Army barracks, but they are clean, dry and free from bugs and rats. Mr. James insists on periodic cleanups and on keeping the compound neat. When a worker recently broke down a door during a disput with his wife, Mr. James made him pay the $38 repair bill. Some camps have dismal accommodations; one crew leader has housed his charges in an abandoned potato shed.

The James crew benefits also from the help of outside agencies in the area. Day-care centers tend the workers' infants, and each day a yellow bus hauls children to a special school for migrant families in nearby Accomack County. There is some dispute about the school's quality but it keeps the children out of the fields and feeds them solid, balanced meals

Boss Men: Migrant Farm Workers Find Lives Controlled by Leaders

Continued From Page One

to supplement a diet that often consists only of pork, beans, cabbage, rice and bread.

The migrant health project in Nassawadox, 10 miles north of Eastville, sends Dianne Diaz, a young nursing student, to visit the camp every few days to check for sick persons who should visit the project's mobile clinic. "Mr. James is awfully cooperative," she says. "The first time I went there, he went through the camp and shouted, 'We got a nurse outside. Any of you need help, get on out there.' I've had no trouble at all since then."

Mr. James' relative benevolence contrasts with the approach of Ozell Suggs, who has a 47-man potato-grading crew. Mr. Suggs feels he "doesn't need to worry much" about health and sanitation. "If they want to live like animals, I let them," he says. His formula for success: "You keep them happy. You get them work and you pay them. Some of them like a little wine, so you give them some money and let them go get it."

How many of his crew members owe him $20 or more for wine? "I guess pretty much most of them." Does he always get his money back? "I get my money back. I don't have no trouble I can't take care of." Mr. Suggs is six feet, two inches tall, and weighs 285 pounds. The Wellington boots he wears make him look even bigger.

Crew leader Ray Gordon also has an offhand attitude toward the welfare of his workers. The migrant health project recently determined that one of them had tuberculosis and arranged admission to a sanatorium in Charlottesville. Mr. Gordon balked at letting the man—"my best worker"—go for treatment during the harvest, even though the worker's positive sputum test made him a hazard to the other laborers. Only when the county sheriff intervened was the man taken for treatment.

Leon James spends much time recruiting workers, traveling to "the places where migrants hang out" in Norfolk, Baltimore and Philadelphia. But the supply is short. In desperation, he hired 10 local Negroes to help out the crew this year.

'Keep Them Prisoner'

Ironically, hard-bitten crew leaders like Mr. Suggs seem to have less trouble keeping workers than "humane" ones like Mr. James, who reports a high turnover. Since May 1, he has employed more than 100 different workers in his 35-to-40-man crew. "To keep migrants today, you've virtually got to keep them prisoner," says one veteran Eastern Shore farmer.

This old hand might have added that he, and the other farmers relying on migrant labor, are in something like economic bondage to the crew leaders themselves. The five trucks that haul potatoes from Mr. Hoeffner's fields belong to Mr. James. For every 100 pounds of potatoes unloaded from the trucks, Mr. James gets 29 cents. The price doesn't change, regardless of the price that Mr. Hoeffner gets for the produce on the market.

This summer Mr. James showed up at the Hoeffner farm a week late and a few workers short. That cost Mr. James and his crew of potato graders some money, but it hurt Mr. Hoeffner and Raymond Briggs, the other local farmer using Mr. James' crew, far more. Most of their potatoes had to be shipped in bulk by the truckload, fetching a lower price than if there had been time to grade out the better-quality potatoes in 50 or 100 pound bags.

Mr. Hoeffner acknowledges that Mr. James "has his faults," but, he says, "I don't think I could find a better crew leader." That was a reason for the new housing that Mr. James' workers got, and it also accounts for the 29 cents per hundredweight paid Mr. James. Some crew leaders offer to work for as little as 15 cents a hundredweight.

Mr. James and his brother Louis started the crew in 1946 when they respectively were 17 and 19. The business now includes the five potato trucks and a green and black school bus used to transport the workers. Louis, now 42, has retired from crew leading to manage the other family enterprises in Florida. Now Leon is accompanied by his father Allen, a garrulous, 250-pound former field worker, aged 60, who handles many of the dealings with the laborers.

"He cusses at you a lot," says one field hand, "but he don't mean it."

Living With the Troops

Both father and son live modestly. They stay in the compounds with their crew (Allen is separated from his wife, and Leon leaves his wife and 11-year-old son in Florida during the harvest), drive old-model cars and usually dress in rumpled green work uniforms. "They're kind of like grandpappies to all of us," says crew member Roosevelt Buchanan, to whom the Jameses lent $283 for an auto repair bill before coming north to Virginia.

Not all crew leaders live modestly. On a recent evening, Roscoe Simmons, a Negro crew leader, was observed in a chauffeur-driven, air-conditioned white Cadillac, roaring past a farmer in a battered pickup truck on a local highway.

However, crew leaders, flamboyant or modest, find themselves in a dwindling industry. Migrant labor is fading from the Eastern Shore. A decade ago, there were 14,000 migrant workers in Northampton and Accomack counties each year; now there are about 6,000.

The families that have grown vegetables here since the days of slavery now find that the sandy soil and unpredictable weather won't support crops large and uniform enough to compete with produce grown by mechanized methods and trucked in from other regions. Many large farmers and farming corporations are switching to rye or soybeans, which don't need migrant labor. Some smaller farmers are quitting the business altogether and using their land for more profitable enterprises, like tourist camping grounds.

Adding to the crew leaders' problems are the unscrupulous "free lance" crew leaders who ignore Federal regulations governing migrant labor. These contractors arrive without a work contract, house their crews wherever they can find a roof and seek work by undercutting the usual prices.

Leon James estimates that migrant laborers — and crew leaders with them — will have vanished from the Eastern Shore within 10 years. But the Jameses will keep at it until the end. Leon says simply, "I like crew leading," and his father Allen says, "I do it to keep busy. It's all I got to do now."

Slim Pickings

Migrant Farm Hands Strain for $1 an Hour Harvesting Cucumbers

A Reporter Finds the Work Dreary, Housing Squalid; Workers Accept Their Lot

'Mother Said I'd Be Poor'

By RAUL RAMIREZ
Staff Reporter of THE WALL STREET JOURNAL

KEELER, Mich.—The migrant farm worker tends to dream of the "nice field" or the "$100 deal" ($100 a week) that lies ahead in a rosier future. "Just wait until we get to Ohio," says an aging Mexican-American laborer. "The tomatoes will be as big as pumpkins, and we'll have work every day."

Listening to such talk is dispiriting, for the plentiful crops, good living conditions and generous pay never seem to materialize. The old worker concedes that he got to the Michigan fields too late last year to do well. "But this year—you wait and see," he says smilingly.

I saw. In a week-long stint as a cucumber picker, I found that the $100 wage is more likely to be $40 to $60 a week, with grinding labor, dreary housing, inadequate food, and an economic system that fixes the worker in bondage to his crew chief. The hopeful chatter in the evenings comes to seem like idle dreaming indeed.

This is the second of two stories on the migrant farm workers—most of them from the South—who work each year on the harvests in the Middle Atlantic and Midwestern states.

Nobody knows precisely how many migratory farm workers there are in the U.S.; the Senate subcommittee on migratory labor has estimated that there are 276,000, most of them originating in Florida, Texas and southern California. The migrants at my camp came mostly from three distinct groups: Mexican-American families that make a yearly circuit from Florida through Michigan, Indiana and Ohio back to Florida; white Americans who head north from Tennessee and Kentucky in their dilapidated autos each summer in search of temporary work; and rootless single men who roam the countryside working long enough at each stop to buy food and drink. At my camp they ranged in age from five to more than 70.

In this portion of Michigan the crops are cherries, apples, cucumbers and an array of other fruits and vegetables. Picking cucumbers, I found that you have to scramble to make $1 an hour.

On the first morning, a burly Mexican-American overseer thrust a plastic half-bushel basket into my hands and informed me that I would be paid 45 cents for each time I filled it. "Get to work," he snapped, repeating the command in Spanish to make sure I understood.

It turned out that the field in question already had been picked once. The big cucumbers were gone. Left on the vines were the smaller vegetables, and over-ripe ones. A cheerful 13-year-old girl showed me how to beat the system, putting the less desirable vegetables in the bottom of the basket and the acceptable ones on top.

Two an Hour

"That will fool them at the truck," she said smilingly. It did. My baskets were accepted without comment and emptied into a big crate. Even so, I only managed to deliver six baskets in the first three hours of work, for earnings of 90 cents an hour. Occupational hazards included scratches from the prickly vines, cramps in the lower back and eventual aching of the thigh muscles. Other workers said I was proving quite productive, however.

Jesus Flores, the crew leader who had recruited and transported most of the workers to Keeler to work as a team, said that he only got paid 10 cents for each basket of cucumbers delivered by his laborers. "It isn't as easy for me as you think," he said.

Mr. Flores was a better than average crew chief. For instance, he didn't charge for transportation to the field each day, as some chiefs do. But he had extra sources of income. On payday, he deducted 20 cents from my wages, "for the Government." But he never asked for my Social Security number. And I had difficulty collecting from him for my last day's work—90 cents for two baskets of cucumbers. Finally he pulled a $1 bill from his pocket and handed it to me. "Keep the change," he said.

Home for me in this labor camp was a nine-by-12-foot cabin, one of 10 such structures standing back to back in a double row. Fire had blackened part of the walls and roof, but my cabin had two rusty metal beds, a decaying couch, and an old refrigerator and stove—amenities lacking in many camps.

However, it lacked plumbing, shelves and closets. Old paper bags and newspapers had been used in an unsuccessful attempt to plug cracks in the walls and ceiling. It was stifling hot in the daytime, freezing cold at night. On the walls were momentos of earlier residents—drawings of cars, mountains and houses, and the penciled message "Ignacio loves Maria."

An Old Hand

One of my roommates, a veteran on the migrant labor circuit, had had the foresight to bring a faded blanket with him. This was Jess, a 24-year-old Mexican-American whose right arm and leg are withered from a childhood disease. Jess has worked in the fields since quitting school in the sixth grade.

My other roommate and I made do without blankets or other bedding. He was Steve, a 19-year-old Tennessean who recently spent 37 days in jail for driving a stolen auto. Now a drifter, he has been trying to save enough money to head for Detroit, Chicago, or back to Tennessee. "Anywhere," he said, "just to get out of here."

The cabin stank of sweat, grease and rotting fruit. Fully clothed for warmth, I slept on a torn and fetid mattress above springs fastened to the bed with bits of rope, old electrical cord and coat hangers. Flies and mosquitoes circulated freely.

It is an existence that a young single man

Please Turn to Page 10, Column 2

Slim Pickings: Migrants Strain For $1 an Hour Picking Cucumbers

Continued From Page One

can endure. For families, it is grim. The camp's four crude privies stand in a nearby apple orchard. They smell awful, and many workers simply wander into the orchard. Water, for bathing, drinking and cooking, comes from two taps at one end of the row of cabins.

Next door a family of nine was crowded into a cabin the same size as ours. Ignacio, eight years old, told of the routine in the cabin: "We just turn off the light to keep mosquitoes away and go to bed. My mother then tells us stories about herself and our family. Then we pray together for a while and go to sleep."

Beans and pork chops were my diet for the week I was at the camp, although my roommates and I occasionally slipped into nearby fields in the early morning or late at night and snitched a few peaches, apples or potatoes. Jess and I ate from a single plastic plate, using the only spoon in the cabin to scoop the food onto pieces of bread. We shared an old water jar.

For medical problems there was a clinic in Keeler, two miles from the camp. But crew leaders weren't eager to have workers take time off for the excursion. Next door a five-year-old boy had received 11 stitches for a cut in his foot, but hadn't returned to the clinic for removal of the stitches. The foot was infected and swollen. "I was supposed to take him back to have the stitches out," said his mother. "I've mentioned it to Jesus (the crew leader) a couple of times, and he's changed the subject."

So resigned are migrant workers to their situation that they often fail to seek out existing facilities. Church groups and state agencies offer various kinds of assistance that the migrants seem not to know about. For instance, two miles from the camp the Michigan Migrant Ministry has an office that provides canned food and clothes to migrant families at little or no cost. But most migrants were ignorant of this service.

One reason is that some growers and crew leaders make it difficult for outside agencies to establish communications with the workers, viewing such visits as a possible challenge to their authority. Most of the camps in this region are surrounded by signs reading "Keep Out" or "No Trespassing." One local farmer recently beat up an employe of the United Migrant Opportunity Inc., a Federal Office of Economic Opportunity agency. The agency has vowed to move against attempts to isolate workers from outside help.

The fatalistic outlook of the workers is evident in the words of a Puerto Rican woman, a mother of six: "There just isn't enough work around here, and the pickles are too scarce when we do work. When I was little, my mother told me that we were poor, and no matter how hard I tried, I would always be poor. You know what? She was right. That's why I don't kill myself working. It isn't worth it."

Why don't the workers unionize? "I don't mess around with that," said one Mexican-American man. "Look, the minute you start talking of unions and strikes you'll get kicked out of the camp. And how the hell are you going to feed yourself and your family if you don't have any money, no work and no place to go? It's bad enough the way it is, but it could be worse."

The camp where I worked is owned by Ferris Pierson, a grower member of Michigan Gov. William Milliken's commission on agricultural labor. "I'll be the first to admit that some of this housing isn't the best in the world," Mr. Pierson says. But he believes his cabins are above average. "At least we provide them with bottled gas, stoves and refrigerators," he remarks.

Mr. Pierson says he even allowed some cucumber pickers working for another grower to stay in his cabins. "They literally came to me with tears in their eyes," he says, adding, "What are you going to do with these people? What I want to know is what the Government is going to do with these people—what anybody is going to do for them."

He sees hard times ahead for growers, who are faced with rising costs and diminishing profits. "The farmers are just about at the end of their rope," Mr. Pierson claims. And, he says, the crew leaders are apprehensive too. "I think a lot of them are more worried about what's going to happen three years from now than about the conditions today."

him that the new chairman would carry out his planned reforms.

From that standpoint, Kirkpatrick was the logical choice. He had headed the 1969 American Bar Assn. special commission to study the FTC, and the final report pretty much agreed with an earlier one by consumer advocate Ralph Nader: The FTC should be abolished if it *did* not become more consumer-oriented, spend less time on trivia, and ax its deadwood staff.

Kirkpatrick's acceptance last month indicated that he thinks that the FTC is worth saving and that Weinberger had made a good start in that direction.

Progress. Weinberger's leadership stopped the bickering among the other four commissioners and brought unanimity to almost every commission decision. By emphasizing the consumer side of issues, Weinberger got a good press.

Kirkpatrick is expected to extend reforms started by Weinberger

His reorganization—which on paper seems to be no more than redrawing the lines between the boxes on the organizational chart—received a lot of attention because he lumped all the old offices into two simple categories: Bureau of Competition and Bureau of Consumer Protection.

Kirkpatrick's challenge will be to pick up where Weinberger stopped. As Commissioner Mary Gardiner Jones said, "Neither the commission nor the staff can go through another six months of being remolded to fit the new chairman's way of doing things."

Kirkpatrick's chief problem is to fill a number of key staff jobs at FTC, a chore which had occupied much of Weinberger's time during his brief tenure. Two of the most important vacancies at the moment are those of director of the Bureau of Consumer Protection and director of the Economic Research Bureau, which has been unfilled for almost a year.

While Kirkpatrick is expected to keep up the consumer-protection momentum started by Weinberger, there may be more action by the FTC in the antitrust field. For one thing, the FTC staff is already working on the potentially explosive investigation of concentrated industries, and a second conglomerate study is in the works.

As former chairman of the ABA section on antitrust law—Kirkpatrick succeeded Richard W. McLaren, who is now the Justice Dept.'s antitrust enforcer—Kirkpatrick is expected to step up enforcement of the Robinson-Patman Act, which prohibits discriminatory pricing as unfair competition, or to seek amendments suggested by McLaren a year ago. ■

AGRICULTURE

Farm & Agriculture

Farm bill makes superficial cuts

The 1970 farm bill, which passed the House last week and is now before the Senate, makes some changes in the controversial farm support program, but these amount to small potatoes. Its most publicized provision would shave subsidies ($3.5-billion in 1969) paid to big agri-corporations and to individual farmers. But even this modest economy, estimated by Agriculture Secretary Clifford M. Hardin to amount to only $48-million, may be something of an illusion.

There is now no dollar limit on the amount of subsidy a farm or farmer can receive. In 1969, for example, J. G. Boswell Co. in California was the top subsidy collector, receiving more than $4-million. On the surface, the new measure appears to do away with such hefty doles. The House bill seems to limit subsidies for cotton, wheat, and feed grains to $55,000 per year per farm. But the powerful farm bloc has taken the teeth out of the measure by writing in a clause that could virtually nullify this limit.

The loophole would allow a farm—owned either by a corporation or an individual—to subdivide itself into smaller units, with the $55,000 limit imposed on each. Farmers could then deed their land to wives, children, or friends to get extra payments; corporations could do the same by setting up dummy subsidiaries.

As a result, executives like James Camp, president of S. A. Camp Co., of Bakersfield, Calif., are not overly concerned about the House action. Cutbacks in federal subsidies "will mean a lot of difference in cash flow," he says, "but we have two alternatives: We can break our ranches up into smaller units and lease or sell them to other farmers, or we can go into other crops."

Almost a third of Camp's 30,000 acres is used to grow cotton. "You can't grow it without subsidies," he says. "Without them, you would have to sell at the world market level of 23¢ to 24¢ a lb." If cotton limitations are signed into law, Camp explains that he would probably shift his cotton acreage into "permanent plantings of wine grapes, nectarine trees, figs, and olives—crops with long-term cash return value."

Bellwether? Though it is a weak start, the House-passed bill seems to herald significant changes in the farm program. For example, the concept of parity for cotton, which is related to the purchasing power of farm incomes between 1910 and 1914, is being changed from a varying formula to a fixed ceiling. The bill also would give the farmer greater flexibility in choosing what he can grow on his land. This changes the current approach, which forces farmers who want subsidies to grow certain crops in certain quantities.

The Senate, where the Agriculture Committee will take up the House bill next week, could cut the subsidy limit below $55,000. Democratic Leader Mike Mansfield of Montana has talked about reducing it to $30,000, and there are signs that some loopholes will be blocked there. In any event, a farm payment limitation seems a sure bet this year.

The bill has been helped by disclosures that gentlemen farmers—such as Senator James O. Eastland (D-Miss.)—receive huge sums from the program. Last year, Eastland Plantation, Inc., of Doddsville, Miss., harvested $146,792 from the government for not growing certain crops. Other not-so-well-known congressmen—and their relatives—also get farm payments. Senator Henry Bellmon (R-Okla.), Representative John M. Zwach (R-Minn.), and Representative Mark Andrews (R-N. D.) are among them. So are relatives of Senator Milton Young (R-N. D.), Representative George Mahon (D-Tex.), chairman of the House Appropriations Committee, and Representative William J. Scherle (R-Iowa). In all, the senators and the congressmen and their relatives collected about $250,000 last year.

Beyond this, opponents of farm subsidies note that the number of big farmers on the government dole is growing. In 1968, the list of recipients who got $100,000 or more totaled 261; last year it was 353. ■

Farm subsidies: the top 10 collectors

Company	Location	1969 subsidy
J. G. Boswell Co.	Corcoran, Calif.	$4,370,657
Giffen, Inc.	Huron, Calif.	3,333,385
South Lake Farms	Fresno, Calif.	1,788,052
Salyer Land Co.	Corcoran, Calif.	1,637,961

U.S. LABOR DEPARTMENT REMINDS FARMERS OF
LAWS APPLYING TO HIRING OF YOUNGSTERS

WASHINGTON -- The U.S. Department of Labor has reminded farmers of Fair Labor Standards Act requirements relating to employment of children in agriculture. The reminder was coincident with the start of spring plowing and planting in some areas.

The Act prohibits employment of farm workers under age 16 during school hours. Children of any age may be employed in non-hazardous agricultural jobs outside school hours. The law also requires that workers on large farms must be paid a minimum wage of $1.30 an hour regardless of age.

Other regulations restrict farm workers under age 16 from operating certain tractors and agricultural machinery and engaging in other hazardous occupations. Exceptions are provided for youths who have taken 4-H Club or vocational agricultural training and for children who work for their parents.

Workplace Standards Administrator Robert D. Moran emphasized that the intention of the law is not to deter children from working, but "to insure that they will not substitute work for education that will prepare them for better-paying employment later on."

He pointed out that many youngsters must work in order to meet expense associated with staying in school.

Administrator Moran suggested that employers protect themselves from penalties for unintentionally violating Child Labor Provisions by keeping on file an employment or age certificate, or other documentary evidence of date of birth, for each minor they hire for farm work.

Age certificates are issued by local School or State Labor Department in 45 states, the District of Columbia and Puerto Rico. In Mississippi, South Carolina and Texas the U.S. Workplace Standards Administration's Wage and Hour Division offices issue Federal age certificates.

(MORE)

In Idaho, the State Department of Employment issues Federal certificates.

All farmers employing youths are required to keep records of their names, local and permanent addresses, dates of birth, types of work they perform and wages paid them.

In fiscal 1970, U.S. Labor Department Compliance Officers found 1,472 children under age 16 illegally employed on farms during school hours. More than 90 of them were engaged in work declared hazardous.

Hazardous occupation restrictions most frequently violated involved driving tractors of over 20 BTO horsepower and handling dangerous agricultural chemicals.

Farm workers under 16 are also prohibited from working in enclosed areas with certain animals maintained for breeding purposes and working on high scaffoldings or in places deficient in oxygen or containing toxic atmosphere, such as some products storage areas and manure pits.

Moran said, "Employment of school-aged youths is necessary on many farms and is often beneficial to them both as an educational experience and as a source of income. But we must not lose sight of our moral and legal responsibilities to ensure that their educational opportunities and physical well-being are not jeopardized while they are working -- and to see that they receive fair pay for their labors."

Moran urged employers to contact their nearest U.S. Labor Department Wage and Hour Division for any information about Compliance with Federal employment laws.

Migrant Workers

Week of July 12, 1971

ACTIONS BY LABOR DEPARTMENT TO AID BLACKS,
OTHER MIGRANT FARM WORKERS CITED BY OFFICIAL

WASHINGTON -- The Labor Department has outlined major steps being taken by the Administration to move migrant farm workers into stable jobs or to provide them with better economic and social protections.

"The majority of migratory farmworkers come from seriously disadvantaged groups," Malcolm R. Lovell Jr., Assistant Secretary of Labor for Manpower, said. "Many are blacks or Mexican Americans, whose employment problems are compounded by discrimination."

Mr. Lovell told the House Subcommittee on Agricultural Labor that the Labor Department has:

1. Launched a long-range comprehensive manpower program in rural areas to move migrant workers into stable, year-round employment, primarily in nonagricultural jobs. More than $20.2 million is earmarked for the first year of operation.
2. Advocated raising the minimum wage in agriculture from the present level of $1.30 an hour to $1.45 by January 1, 1972, and to $1.60 on January 1, 1974.
3. Supported the extension of unemployment insurance to farm workers in large agricultural establishments. The Labor Department is preparing a study on the effect of such an extension for submission to the Congress.
4. Launched an investigation into the charges made by 16 organizations and 398 specifically named farm workers that the State Farm Labor Services are guilty of discriminatory actions.

(MORE)

"The Department regards these allegations of discriminatory practice as very serious," Lovell said.

"I have instituted a thorough investigation into the specific charges in order to determine that all pertinent laws, regulations and policies are being followed . . . in the best interests of farm workers."

Lovell told the subcommittee he believed "the Department of Labor's new $20.2 million program is a constructive step toward helping migrants.

"From the standpoint of both working and living conditions," he said, "the disadvantaged workers in our society are those who migrate from area to area, following the crops."

Lovell said the average annual earnings of a migrant worker home-based in southern Texas and a Mexican American was $1,813.

The State Farm Labor Services have been helping an annual average number of 118,000 such workers with job information and job itinerary schedules.

Such assistance will be continued as long as there are migrant farm workers, Lovell said, pointing out that there are fewer migrants each year as farm employment opportunities keep dwindling because of mechanization.

Welfare reform legislation, passed by the House, includes eligibility criteria for families of four with annual incomes of $2,400 or less . . . "which could give many migrant families the basic assistance they need to break out of the migrant stream," Lovell said.

M- Employment Service
W-S-J 1/17/73

U.S. Employment Service Switching Focus From Minorities to Supplying Skilled Labor

WASHINGTON — The employer is back in the driver's seat at the U.S. Employment Service.

In a major policy "redirection" being spelled out publicly for the first time, the Labor Department is pushing the network of state-operated employment offices to switch their primary emphasis back to lining up skilled workers for employers from the focus of the late 1960s on training and placing poor and unskilled persons.

Asserting the effort mounted by the Kennedy and Johnson administrations to make the Employment Service a key vehicle for placing disadvantaged jobseekers hasn't worked, Labor Department officials are telling the federally funded state agencies that "rebuilding responsiveness to employer needs is a key objective in all major labor market areas." Though the switch in emphasis has been hinted at before, it's spelled out with unusual candor in a little-noticed department report the President has just forwarded to Congress.

"Many employers perceive the local employment office as so preoccupied with services to the disadvantaged that they can no longer obtain referrals of any but marginally qualified workers at the lowest skill levels," contends the department's annual report on manpower training. This employer disenchantment has developed since the mid-1960s, the report suggests, when "emphasis was consciously switched away from the ES's (Employment Service's) traditional labor exchange functions toward providing intensified and individualized services to client groups having the most serious problems in preparing for and holding a productive and self-supporting place in the job market."

Critics Disagree

Indeed, the career bureaucrat who headed the Emploment Service setup when the Nixon administration took office told a House subcommittee in March 1969 that "we have been moving very definitely in the direction of our priority being for the disadvantaged." Moreover, he optimistically predicted "employers will appreciate and applaud our efforts to reach and serve the hard-core unemployed more effectively." And less than two years ago, top Labor Department officials were assuring Congress that "emphasis will continue on providing assistance to applicants who have barriers to employment and require intensive employment service assistance."

Some Employment Service critics sympathetic to the disadvantaged jobseeker have freely embraced or implemented by tradition-minded state officials who remained strongly oriented toward employers' needs. A 1971 study by the National Urban Coalition and the Lawyers' Committee for Civil Rights Under Law charged the Employment Service's goals remained "unsympathetic to, if not in direct conflict with, the needs of the disadvantaged."

The Employment Service defines "disadvantaged" as a poor person without suitable employment who is a school dropout, a member of a minority group, under 22, over 45 or handicapped.

Federal officials argue that employers worried about the skills and abilities of workers referred to them simply grew more reluctant to list job openings with state employment offices. The new report says that while total nonfarm employment was rising about 10% between 1966 and 1970, the Employment Service's placements shrank 30% and "the number of placements of disadvantaged workers also fell." It adds: "With fewer job orders, the ES (Employment Service) experienced increasing difficulty in placing either the disadvantaged or the nondisadvantaged."

Unable to Boost Placements

Despite the special efforts to aid poor and unskilled job-hunters, the state offices "just weren't able to boost" their placements of such workers, insists Robert Brown, the head of the Employment Service. The percentage of disadvantaged job-seekers placed has remained at about 25% in recent years, he reports. "The results were hard to detect for many in the target groups," the new report says.

With the Employment Service's total nonfarm placements down to 3.4 million in the fiscal year ended June 30, 1971, from 6.6 million eight years earlier, the agency "was by then unable to serve very effectively either the job-ready or the disadvantaged with their need for employability development," the report says. The Nixon administration's urgent need in 1972 to cool the fires of overall unemployment apparently spurred the policy switch at the Employment Service.

"With national interest focused on speedy reduction of unemployment," the report to Congress states, "a number of steps are being taken to strengthen the traditional labor exchange function of the ES." The report says the five-year decline in nonfarm placements was reversed in the fiscal year ended last June 30, with such placements rising to 3.8 million from 3.4 million a year earlier. "With a more extensive use of the ES by skilled workers has come a renewed appreciation by many employers of its potential value to them," it boasts.

Both Mr. Brown and the new report stress the Employment Service won't abandon the disadvantaged job-seeker. But the report, signed by Labor Secretary Peter J. Brennan, says, "an era of uninterrupted budgetary expansion for manpower training programs has ended" and "selective reductions in effort will be required in some areas and a leveling-off in others." Even the drive to improve "the general labor exchange area must be shaped with more attention to cost," it adds.

Among the steps the Employment Service has taken to emphasize its role as a labor exchange is the formation of an informal national employers' committee for improving the network of over 2,100 offices across the nation. Plans are under way to experiment in six cities with the committee's recommendation of setting up "an identifiable Job Placement Service to insure delivery of more effective services to the job-ready and to employers."

EMERGENCY !

GREENS SELLS OUT TO HEUBLEIN !

SLAPS INJUNCTION ON FARMWORKERS !

Since Monday, August 2, the United Farm Workers and some of our friends have been picketing Green's Liquor Store at 737 Ponce de Leon Ave., hoping to persuade the owners, Jerry and Leonard Greenbaum, to remove Italian Swiss Colony Wines and Smirnoff Vodka from their shelves. As you know, the grapes for Italian Swiss Colony wines are picked under slave labor conditions.

THE PICKETING WAS SUCCESSFUL. We were able to persuade about 1/3 of the customers to shop elsewhere until the Greenbaums opened their eyes to our pleas.

THE GREENBAUMS RESPONDED TO THOSE PLEAS BY GETTING A COURT INJUNCTION AGAINST ANY PICKETING OR ORGANIZED BOYCOTT AGAINST THEIR STORE ON PONCE DE LEON!

As callous as these two men have shown themselves to be, they can still be reached.

Please call them any time you can. Please tell them to open their hearts to the plight of migrant workers.

CALL: Jerry Greenbaum (Greens, Buford Hwy.) 633-4272 or at home: 237-7168

Leonard Greenbaum (Greens, Ponce de Leon) 872-1109 or home: 872-4094

If you can not reach them at the stores, then ask to talk to the manager (Jan Jackson at the Ponce store) or anyone who can take a message.

WRITE: Jerry Greenbaum, 1153 Bonview Lane, NE Atlanta

Leonard Greenbaum, 1810 Lenox Rd. NE, Atlanta

LET THEM KNOW HOW YOU FEEL! We have been ordered by the courts to refrain from asking you to boycott the store on Ponce. SO PLEASE HELP US IN ANY WAY YOU CAN.

Viva la Causa!

Atlanta, Georgia 30316
Phone: 622-6296

The Fresno area of California includes non-union growers who have avoided dealing with their farm workers. We need your help in spreading the word about these scab grapes.

There are plenty of union grapes available, but they will only be ordered if consumers demand them and keep after their stores.

Please talk with your store manager and leave this leaflet (enclosed) with him. Pass one on to a friend. Check each time you shop for the union label on the grape boxes, displayed or in the cooler. This is your right as a consumer.

Please let us know immediately if you find non-union grapes.

Thanks for your help.

The art of putting capital to work

Few subjects are of more interest and importance to business and, by extension, to society than the allocation of resources. In these times, when priorities are being challenged, when capital is scarcer and more expensive than usual, there is intensified competition within corporations for the employment of their resources. Moreover, there is increased external interest in the methods used by a corporation to determine how it will allocate its resources. This holds particularly true of the larger companies.

Joseph L. Bower, an associate professor of Business Administration and a research fellow in the Institute of Politics at Harvard University, has written a book that is most timely. Based on two years of field research into the strategic investment planning of one giant corporation, Professor Bower's study examines the problem from the point of view of the men in management who make the decisions. Using a Harvard Business School case-study approach, the author follows four corporate investment projects from inception to approval, and his analysis provides insight into the resource allocation process.

Managing the Resource Allocation Process
by Joseph L. Bower
Harvard Business 363 pages ▪ $8

order

The author spends considerable time on the formal procedures involved. These, of course, are always necessary for orderly administration, but it is not the formal procedures within the corporation that affect the results. Rather, it is the assumptions and individual inputs upon which such procedures are based that frequently account for a result different from the one that may have been anticipated.

Sound business planning must be the basis for making investment decisions, for an investment is the commitment to implement some specific business plan or strategy. Within the large, multiproduct company, proposals for investment projects are usually initiated or promulgated by specialists and managers in a particular segment of the business. Their proposals are reviewed and then approved or rejected by another layer of management. In effect, two substantially different processes are at work—one determines the content of the proposals and the other determines which proposals will be funded. Different people are involved in these processes and they are frequently motivated by different objectives or influenced by different forces.

A manager's input, according to Professor Bower's findings, is affected by the way he himself is selected, the way his job is defined, and by how his performance is measured and rewarded. Financial models and forms just cannot evaluate these factors. The part-whole relationship established by a company will determine if there is real decision-making on an integrated basis or whether a decision is made for the good of the sub-unit.

If the incentive system rewards short-term performance, investment decisions will be distorted. Separation of business strategy from the judgmental decision on investment plans may give the corporation a better result, since inputs of all levels of management are made and the review is by individuals who are committed to the corporation's total good.

The businessman can gain from this book a better understanding of the factors that affect the definition of a project, the impetus that moves it forward, and the final approval. The research makes clear that quantitative procedures and formulas do not operate in a vacuum. Interaction and results will differ from situation to situation because people, environment, goals, and rewards will differ.

The considerable detail and thorough research help the reader put into perspective many of the small actions that can be responsible for a good or a bad investment commitment. It is well to understand that widely differing results may occur although the procedures and facts may be the same. Business needs the best results from its capital investments both for better business and a better society.

—William D. Eberle

BOOK BRIEFS

The President Steps Down
by George Christian
Macmillan ▪ 282 pages ▪ $6.95

George Christian, the big, wry Texan who was Lyndon B. Johnson's last and best press secretary, tells more than he used to but less than he might have in this memoir of the winding down of Johnson's Presidency. He casts light into some dim corners—the anguished process of stopping the bombing of North Vietnam, the bumps that marred the transition of power, and LBJ's fights in those final weeks with Labor Secretary Willard Wirtz and Interior Secretary Stewart Udall. Christian provides fascinating insights—and some good yarns—about the love-hate relationship between Johnson and the White House press corps, and offers a dramatic picture of the pressures of the Presidency. Unfortunately, he leaves a lot more unsaid. He remarks, tantalizingly: "Perhaps God saves the Republic from dictators by giving all of its leaders an Achilles' heel." An enlargement of that theme would have told us more about Lyndon Johnson as man and President. But like the good press secretary he was, Christian is still protecting his boss.

The Real Spiro Agnew
edited by James Calhoun
Pelican Publishing ▪ 128 pages ▪ $5.95

This, in his own pungent prose, is the essential Agnew. Friends and foes of the Vice-President will find grist for their mills in this frankly friendly compendium of quotations from a household word, quotations that doubtless will be re-echoing from both camps during the upcoming election campaign. Beneath the stacks of epithets for impudent snobs, limousine liberals, and self- appointed élitists who are Agnew's favorite targets is a rich lode of pure, undistilled Middle America.

The Bernie Cornfeld Story
by Bert Cantor
Lyle Stuart ▪ 320 pages ▪ $8.95

The rise and fall of so fascinating a financial showman as Bernie Cornfeld should provide ample color for a richly detailed portrait. Unfortunately, Bert Cantor has sketched a familiar picture in black and white, with large gray areas. Cornfeld, a Brooklyn-bred social worker, blended acumen and *chutzpah* to build Investors Overseas Services into a $2-billion conglomerate—thumbing his nose at the financial establishment every step of the way. And he enjoyed a life style to match: a Geneva villa built by Napoleon, soirées at his 12th-Century French castle, and ladies in waiting throughout Europe. Then last May he was abruptly ousted as IOS chairman, the victim of the bear market, investment mistakes, and his own failure to control the company's lavish spending. Much of the book is second-hand, pointless, or marred by minor errors and editing lapses. Events have now outraced the book; Cornfeld is back on the IOS board and executive committee, and his story may yet have a new ending. ▪

Soil and Water in the Middle East

TWO OPINIONS about agriculture in the Middle East are widely held. One is that a region that was once the granary of the ancient world has played out its usefulness forever, exhausted its soils, denuded its forests, and has generally worn out its resources beyond repair. The other looks to water as the rejuvenator that can in short order restore the region to its former productiveness.

Both judgments are myths. As to the first, the region is not played out. With appropriate modern farm technology practices and management, and freed from restrictions, inhibitions, and rigidities that lie in the political, social, and institutional field, the natural resources of the Middle East could permit production on a vastly higher level. In a matter of two to three decades, more or less, agricultural output could be doubled in Egypt, multiplied tenfold in Iraq, and increased to intermediate degrees in the other countries.

As to the second, water alone is not the key. It is only one among many necessary inputs, and it is not now and will not for a considerable time be a limiting factor in most of the region. Indeed, neither water nor any other single input is the magic wand that will quickly and painlessly produce agricultural plenty and prosperity. There is a whole package of separate but closely interrelated programs that will lead to sustained advances in agriculture. An improved variety of wheat, grown in adequately irrigated and properly drained soil, with good land tillage and uniform seeding, nourished by enough fertilizers of the right kind, protected against weeds and infestations of diseases and insects, may be tremendously productive. The same wheat in an unimproved environment may produce little more than does the old variety.

Several properly coordinated improvements form the productive package; each part, alone, has limited value and under some conditions might even be a handicap. Nor will all of them suffice unless a variety of conditions can be met—unless the prices offered for the commodities produced can be counted on to leave a reasonable margin of profit; unless there are ways of obtaining necessary inputs at prices that permit this profit margin; unless the products can be easily moved to market, and so on.

In this context, water is an important ingredient. So are suitable soils to receive it. And suitable soils are probably scarcer in the Middle East than water. To make the package analogy does not mean that the significance of one component vis-à-vis another will not

Social Goals and The Machine System

THE SCIENTIFIC community has traditionally resisted the notion that it should deal explicitly with social values and goals as a part of its enterprise. There has been a strong belief that the domain of values and goals is "off-limits" to science. The tradition of logical positivism, so strong in science, has held that judgments of value are merely emotional or verbal assertions removed from categories of truth and falsity—a position also characteristic of some Marxist and linguistic philosophers.

Two other factors were probably equally important. First, in that broad domain of physical concepts where a machine system paradigm is operational, science could make great advances without considering social goals and values. Taking these to be exogenously given, it could restrict its attention to operational rules or efficiency criteria. Second, there was a strong desire on the part of the science community to protect its life and growth from persecution by religious and political institutions that considered the realm of value their exclusive domain.

Economists and other social scientists have been inclined to be hypersensitive about their claim to a position in science. They have, accordingly, slavishly emulated the physical sciences. They have worked hard to apply to social phenomena the machine system concepts that have proven so fruitful in application to many physical phenomena. Successful applied social sciences have emerged where certain social phenomena can be reasonably approximated with machine system concepts (especially in economics). Limited success in some areas has encouraged them to continue applying the same concepts persistently and mistakenly to social phenomena that are manifestations of a process of social learning. They have also been conscientious in protecting their "scientific purity" by excluding issues of value as matters beyond legitimate concern of the objective social scientist.

THIS SENSE of professional insecurity may have reinforced, in turn, their attachment to deterministic models. The classical market equilibrium model of the economist, for example, is essentially the model of a machine system closed to new knowledge. In such a concept the economic system can be seen as occupied with purely instrumental goals (like producing bread or refrigerators) that are indirectly related to more general social goals considered as given. Under the control of such a model the economist can absorb himself with considerations of system efficiency yielding a static state optimum.

When he moves to a consideration of the phenomena of social development and is confronted with options for changing social behavior, the social scientist has greater difficulty in dodging the normative problems. Nevertheless, an attempt is made to carry the focus on instrumental efficiency over into the developmental realm. This may help explain the great appeal of the deterministic developmental models. Under the control of such concepts, a change in social behavior can be evaluated in terms of whether or not it efficiently contributes to the transformation leading to a predetermined terminal state. Even those who are concerned with stochastic models (e.g., game theory, decision theory, etc.) are primarily occupied with establishing the rule for efficient procedure in advancing or protecting established goals in the context of uncertainty and competition between the decision units. The nature of the goal and its transformation over time is not seen, itself, to be a function of the process.

Under the control of the social learning metaphor the goals must be acknowledged to be a function of the process. In evolutionary experimentation it is the goals that form the test of the developmental hypothesis, and through its practice the goals themselves are brought under periodic review and modification. If social science is to concern itself with the study of this process, it will be brought to an inescapable confrontation with the realm of values.

The Lessons of Two Tragedies

Current Issues 10-6-70

The Scranton commission's reports on the student deaths at Jackson State and Kent State display an evenhandedness that won't please extremists at either end of the spectrum. Yet both studies carry the ring of truth.

At both institutions students did a great deal to provoke the subsequent tragic events. At Jackson State, the Presidential panel said, some students wanted violence to bring the National Guard on campus and thus dramatize their concerns.

"Spreading false rumors, urging rock-throwing, burning and other violence, and taking violent action to focus attention on student concerns are deplorable and completely unjustified," the commission said.

At Kent State the student provocation was considerably more aggressive. As the panel said, "The actions of some students were violent and criminal and those of some others were dangerous, reckless and irresponsible. . . . Those who wreaked havoc on the town of Kent, those who burned the R.O.T.C. building, those who attacked and stoned National Guardsmen and all those who urged them on and applauded their deeds share the responsibility for the deaths and injuries of May 4."

It justifies nothing to allege, as the students did, that they were protesting national policies they considered criminal. Violent dissent, in fact, lessens the chance that responsible protest will be heard.

Society, after all, has a substantial stake in its own survival, and violence can bring out the worst in anyone, either in those who start riots or in those who try to stop them.

It was bad enough that, at both Jackson State and Kent State, the efforts to control the disturbance were wretchedly mismanaged. At the Mississippi school the police lacked a "clear notion of who was in command," and there was no evidence that the police units had proper training for disorder control and guidelines for using force in coping with crowds.

At Kent State, the Presidential commission commented, "The 61 shots by 28 Guardsmen certainly cannot be justified. Apparently no order to fire was given, and there was inadequate fire control discipline."

What made the matter even worse at Jackson State, the panel said, was that the police evidently felt they had the full support of their superiors and the community for almost any action they might take, as long as those they shot at were black. However general that feeling may have been, it wasn't weakened by a grand jury's later comment that those who take part in civil disorders must expect injury or death when police seek to restore order.

The panel noted that the two tragedies contain lessons for almost everyone—students, police, Guardsmen, faculty, university administrators, governments, the general public. If the lessons aren't learned, Kent State and Jackson State may be merely preludes to greater tragedy.

Unrest on the Campus Poses Hard Choices For Today's Freshmen

Youth at Wisconsin Grapples With Activists' Pressures, Unfamiliar College Routine

A Highly Charged Atmosphere

10-6-70

By SUSAN B. MILLER
Staff Reporter of THE WALL STREET JOURNAL

MADISON, Wis.—Standing behind a temporary fence erected around the remains of the physics building at the University of Wisconsin, 18-year-old Stephen Schwark stares at the gaping hole left when a terrorist bomb exploded Aug. 24.

"First you try to recreate the scene for yourself," he says. "Then you think of all the valuable research destroyed and, worst of all, the man who died. It's appalling—it just doesn't seem real."

The bombing of the physics building is just one of the new and difficult realities confronting Steve Schwark as he launches his college career this fall as a Wisconsin freshman. The transition to college life has always been rough for freshmen, of course. There are, for instance, the difficulties of adjusting to dormitory life or working up nerve to ask a girl for a date or lining up course schedules.

But Steve Schwark also is wrestling with the very untraditional problem of how to react to the issues and groups that have made this 35,000-student campus a seething center of radical political activity. Steve, who hails from the small city of Fond du Lac 75 miles northeast of here, says that he personally likes "a lot of things" about the U.S. system. But at the same time he considers it "too cold-hearted, because it doesn't provide for all the people."

Stephen Schwark

As for righting such social wrongs as do exist, he is repelled by the violent tactics of some on the far left—but he worries that "otherwise, you might not get any real change."

"It's all pretty confusing," he says. "But once you get here you feel you ought to choose."

Students, professors and college administrators here and elsewhere believe that Steve's dilemma is shared by a good many of the estimated 1,836,000 young people starting college this fall. They say the tough political choices required by the highly charged atmosphere of many campuses, coupled with the need to adjust to the new ways of college life, have made it more difficult to be a college freshman now than ever.

"When I was here we collected crew-neck sweaters, drank beer and had a good time; we didn't even know how to spell marijuana," says David Vinson, Wisconsin's associated director of admissions and a 1959 graduate of the university. "Freshmen today not only face tougher academic competition but they also have to decide whether to smoke 'pot,' cross a picket line or throw a rock. What we did was sandbox play compared to now."

Pulled and Tugged

"A freshman today is pulled and tugged in all directions by experienced activists, and the choice he makes can boil down to whether he'll take a side or get an education," says Richard A. Harvill, president of the University of Arizona. He adds: "You've got to remember we're talking about kids who are just 17 or 18 years old and thus are acting on very limited experience."

Indeed, involvement with activist campus groups can come almost without making a choice. A small, dark-haired girl who is beginning her sophomore year here puts it this way: "Your friends tell you you'd better join or you're a cop-out, so you join and discover that it's fun. The whole scene—the rallies, strikes, marches, being close to the other kids—hits you like a bulldozer. But there's no time to ask if this is what you really want. Last year, I used to lie awake at night thinking that I didn't really believe all the police were pigs, but the next day I'd go out and say it again. Once I got into it, the easiest thing to do was keep going."

Evidence of the violence that has rocked U.S. universities is particularly abundant here at Madison. In years past this campus was noted about equally for its high academic standing and its beautiful lakeshore setting. But this fall's freshmen are obviously more impressed by the multitude of boarded and bricked-up windows left from the rioting that followed the Kent State shootings last spring.

Much Is Unchanged

During freshman orientation week last month, passersby like Steve Schwark continually gathered to stare at the hole in the side of the physics building, where an early-morning bomb explosion killed a physicist, injured four other persons and caused extensive damage. The university doubled its security force as a result of the blast, and olive-garbed campus police are much in evidence around many buildings.

Student activists, meantime, are keeping the radical viewpoint constantly before their fellow students through posters, handbills, rallies and the like. A recent editorial in the Daily Cardinal, the student newspaper, even attempted to justify the bombing of the physics building. While expressing regret that a man was killed, the editorial described the bombing as a "blow to the American military machine" that was carried out only because no progress had been made toward shutting down the Army Mathematics Research Center that was housed in the building along with regular university departments.

There are unconfirmed reports that students and townspeople, particularly merchants in the campus area, are buying guns in case of more trouble. And a black-lettered sign freshly painted on a block-long fence on busy Univer-

The Class of '74: Campus Unrest Poses Problems for Freshmen

Continued From First Page

sity Avenue predicts that "This university will self-destruct . . . unless."

At the same time, however, most of the life of the university goes on as before. Restaurants, bookstores and clothing shops are crowded, couples stroll the campus walks and students gather in small groups to chat quietly on the library mall.

"You see the damage at the physics building, and then you see guys playing touch football behind the dorms," says Steve Schwark with a trace of amazement. "The whole thing is kind of dreamlike."

For Steve, other things about the bustling, cosmopolitan Madison campus have also taken some getting used to. He says that his home town of Fond du Lac (population 35,317) had "just a few hippies and maybe one or two black families," and he admits that he caught himself staring the first time he saw a group of dashiki-clad young black men on the campus. and has no plans to buy any.

No Bell-Bottoms

Steve's own dress and appearance are conventional. His hair is short and brushed neatly across his forehead ("Short?" he asks with surprise. "It's about three inches longer than it was last year!") He favors open-necked sports shirts with dark, straight-cut slacks. He doesn't own a pair of bell-bottomed trousers

Actually, Steve probably won't be buying much of anything in his first year here. His father, Wilbert, earns about $6,000 a year as a janitor at the high school Steve attended, and Steve wouldn't be at the university at all without the scholarship help he earned by tying with six others for the top academic spot in his graduating class.

Of the $1,558 it will cost him for tuition and room and board, $790 will come from a state scholarship and $600 from a National Elks Club award he won. His father chipped in $150. The rest—for books and weekly incidental expenses—will be paid out of the savings Steve accumulated while working as a car-hop in a Fond du Lac drive-in restaurant over the past several years. He hopes he can get by on less than $10 a week.

Despite Steve's scholastic prowess, his parents aren't altogether pleased with his decision to attend Wisconsin. His mother, shy and pleasant, says she bases her objection mainly on the fact that he isn't staying home and commuting to nearby Oshkosh State University the way his three older brothers did. "It would be so much nicer to have him at home," she says. She goes on to express some concern about Steve's safety at Madison. "The newspapers distort things, don't they?" she asks hopefully. "I'm sure things there aren't as bad as what I've read."

A Proud Brother

Steve's father, a stocky, balding man of 57, professes to have no such fears. "Steve's a good boy—I trust him to do right," he tells a visitor. But Steve says that his father also has had misgivings. "Before I left for school, he told me he was sure I wouldn't disgrace him and Mom," he says. "I guess he meant that he doesn't want me breaking windows or throwing rocks at cops."

Steves closest brother, Dan, a 21-year-old senior physics major at Oshkosh State, helped to direct Steve toward Madison because "he wants to major in political science and Wisconsin's department is one of the best." He says he's proud that Steve "had the guts to do it and break the family mold," yet he, too, confesses to being a bit worried.

"Steve's terribly concerned with doing what's right," he explains. "When he heard that the Elks didn't admit Negroes, he took $50 from his scholarship check from them and donated it to the NAACP. When he heard that people in Mississippi were going hungry, he and some of his friends got the local merchants to finance a 30-mile kids' hike to raise money for them. That's all great, but I worry about what decisions he'll make if he's faced with a really persuasive talker."

Steve admits that while he's "a pretty outrageous liberal by Fond du Lac standards," his political ideas "aren't all that well fixed." When he was a sophomore in high school he supported the U.S. war effort in Vietnam, but now he thinks "we ought to get out as fast as possible." He says that "a lot of things" contributed to his change of mind on the war, "but it was mostly the My Lai massacre story. That really shook me up."

Questioning Demonstrations

He says he hasn't made up his mind on "a lot of the things I'll probably run into here" at Madison. For instance, "I'm not sure demonstrations do any good, but I can see a point where I might think differently," he says. "I guess I'll just have to decide on things as they come up. I'll have to let my conscience be my guide."

Thus far, Steve has been concerned mainly with mastering the logistics of campus life. To ease the transition to college, he picked as his dorm roommate Chuck Giese, his best friend since grade school days. Right now, the two of them are debating how to decorate their room in the new and clean but institutional-looking building. ("I wish I'd brought along my Simon and Garfunkel poster," Steve says.)

Steve wasn't on campus long before he ran into his first bureaucratic foul-up. Like most of the university's 4,200 new freshmen, he registered for his first-semester classes on computer cards during the summer, but in August he received a note saying that a political science course he had requested was full and he would have to find another. When he arrived here, he spent most of a day standing in registration lines and talking to various advisers before he learned that the class wasn't full after all and that he could take it.

With some trepidation, he tried out the food at his dorm's dining room and found that he liked it. He also discovered that he will be able to save some money on entertainment by attending the weekly free movies shown at another dorm.

A Rally Is Canceled

A campus-wide student strike—described as an "all-purpose" shutdown by one girl—was threatened for the first day of classes but didn't come off, so politics have intruded on Steve's new routines only peripherally to date. On the way to one class, he saw a poster asking for a contribution to a fund to support "Americans in exile." The poster apparently referred to draft evaders in Canada, but Steve thought it meant the four young men who reportedly fled to Canada after being accused of the physics building bombing by the Federal Bureau of Investigation. He was appalled. "They're criminals," he says. "The thought of helping them sickened me."

During his first week of classes Steve planned to attend an outdoor rally in supprt of several Black Panther Party members being held in jail in Milwaukee—"I just wanted to see what it was all about," he says—but it rained that night and the rally was postponed.

So far his biggest triumph on campus was when he was asked for directions by another freshman. "At least there's somebody here who doesn't think I look like the newest kid around," he says with a smile.

A Squabble Over 'Green Revolution'

10-6-70 W-S-J

By DAVID C. ANDERSON

We live in an era of stepped up technical and social change, obviously enough, but we often ignore one of its important side effects: Rapid change makes new demands on our rhetoric, the way we put the meaning of things into words.

How important the rhetoric can be is currently illustrated by a dispute among people who worry about questions of economic development in poorer countries. The words at the heart of the argument are "green revolution."

The phrase, commonly used by the big U.S. foundations involved in the problems of developing areas, U.S. Government foreign aid officials and governments of some developing nations, refers to the effects of an advance in agricultural technology which occurred rapidly in the 1950s and 60s.

In the fifties, scientists sponsored by the Rockefeller Foundation came up with special varieties of the food grains which serve as staples in developing areas. The new seeds produced hefty yield increases.

Some Spectacular Claims

The "miracle" seeds were hailed as a way to push back the date of population-food doomsday for developing lands, and during the sixties, attempts were made via the foundations and Government foreign aid programs to rush the seeds into widespread use, mostly in Asia. In the past couple of years, some of those involved in the effort have begun to claim that the green revolution has arrived.

They can produce ample statistics to support the claim. Agriculture and development expert Lester Brown, in "Seeds of Change" (Praeger), a recently published book about the green revolution, reports that by 1969, land planted to the new varieties of wheat and rice in Asia had expanded to 34 million acres, from a mere 200 acres in 1965.

In those years, Pakistan increased its wheat harvest nearly 60% and produced enough rice to become an exporter. India increased wheat production 50%, leading Mr. Brown to predict self sufficiency in food for India by 1972, barring serious political troubles. Ceylon's rice crop increased 34% in the past two years because of the new seeds, Mr. Brown says, and the Philippines, Turkey, Burma, Malaysia, Indonesia and Vietnam have also scored impressive green revolution gains.

Though he acknowledges there still are formidable problems, Mr. Brown cannot resist some ecstatic conclusions. The new seeds, he says, mean that "it is realistic to consider the eradication of hunger for the overwhelming majority of mankind." They "promise to improve the wellbeing of more people in a shorter time than any other single technological advance in history."

As might be expected, such statements soon enough gave rise to skepticism, not over the unquestioned ability of the new seeds to increase food production if handled properly, but over the belief that their impact can be great enough to reverse the drift to famine and chaos. That the new seeds can be the subject of sharply differing interpretation is indicated by the experience of India.

The Rockefeller Foundation recently put out a lushly illustrated 137-page report on food production gains in India which states hopefully that "India's food supply is currently gaining at the rate of 4% a year with 5% well within grasp. . . ." The skeptics sug-

Blessed with favorable weather as well as the new seeds, the strategy paid off in 1967-68. Wheat was abundant in Punjab; Prime Minister Gandhi could claim that the green revolution had arrived; the wheat crop became the subject of a commemorative stamp.

All of this, the skeptics contend, was somewhat misleading.

The Indian agriculture ministry had demonstrated that given optimum conditions—and, always, favorable weather—impressive increases in food production were possible. But the success was limited to the 32.5 million acres, only one-twelfth of India's 390 million under cultivation. To have a major effect on the food supply problem, similar increases would need to be achieved in the vast stretches of poorer, drier farmland, and in the more difficult crops, like rice.

The undertaking would involve not only arranging for irrigation in the dry areas—itself a large problem—but also converting huge numbers of desperately poor, often illiterate and decidedly unprogressive small farmers to the new technology. To many familiar with the process, this is a reason for utmost pessimism. "You have to remember," says one food expert, "that even with all our affluence and adaptability, we still have a hunger problem in parts of the United States. Now think what it means to transfer what we think of doing about it here to a place like India."

The skeptics also note that the large harvests brought into focus a number of "second generation" problems. India's storage and distribution machinery were inadequate for the new yields. Large portions have been lost to pests or spoilage.

And social disruptions seem an increasingly disturbing result of the new seeds. Their economic benefit currently falls mainly to large planters who are already well off; the gulf between rich and poor has widened in the Indian countryside. The prospect of farm consolidation and mechanization suggests rural unemployment and migration of the landless to already overcrowded cities.

Even more serious, some doubters note, is the matter of the green revolution's effect on birth control programs. Nobody contends that higher food production is an alternative to population control; the most optimistic green revolution advocates say the combination of more food and birth control might be a way to avert population disaster. Mr. Brown rather naively asserts that "the new seeds have bought time in which to seek a breakthrough in contraception comparable to the breakthrough in plant breeding."

But, the skeptics point out, if anything, the talk of green revolution makes the possibility of such a breakthrough less likely. In the year following the 1967-68 harvest in India, with green revolution rhetoric as abundant as the new crops, the number of contraceptive loop insertions in India fell 31% over the previous year, and the number of sterilizations fell 13%.

A direct causal link is impossible to prove, of course, but William Paddock, a Washington agriculture expert who also tends to a pessimistic view of the food problem, perhaps sheds some light in a recent article in which he described a conference on the green revolution.

Mr. Paddock writes that someone had brought a Philippine farmer to the meeting to testify about his experience with the new seeds. "The farmer had 10 children and said that because of the new high yielding variety, he and his neighbors would now have enough food for all, and all could enjoy seeing their women in the condition in which they were most beautiful—pregnant."

The prospect of premature complacency over birth control seems even more serious in light of the feeling held to by some that Malthusian laws may be much harder to beat over the long term than they seem.

Thus Mr. Paddock recalls the food problem of Ireland in another era. "In the 17th century, the population of Ireland had come into balance with the carrying capacity of her land. Two million Irish lived there destitute. Then came the 18th century truly green revolution. The Irish potato was introduced to the Emerald Isle from the Western Hemisphere. Agricultural production shot up. The carrying capacity of the land increased. The Irish multiplied accordingly. By 1835, eight million Irish lived where only two million had lived in the previous century.

"Then arrived a totally new plant disease . . . and the potato crop was destroyed. In the resulting Irish famines of the 1840s, two million Irish starved to death, two million Irish emigrated, and four million Irish were left on the land in abject poverty."

A Frightening Implication

Talk is common among green revolution experts that the new miracle seeds may soon be susceptible to new "miracle" plant diseases, and the implication of an Irish-style famine on an Indian scale seems as legitimate as it is frightening to ponder.

Nobody, certainly, advocates plowing under plentiful new crops in hungry nations because they might cause social problems or might leave the world still vulnerable to population catastrophe. But many are beginning to decide that more sophisticated ways of thinking and talking about the problem of nutrition and population are in order.

"What we're really talking about," says Sidney Cantor, a Philadelphia based food and nutrition consultant, "is improving the quality of life, and we need to think in terms of putting a value on the quality of life in developing countries just as we are beginning to think about doing it for the United States."

Mr. Cantor advocates advising developing nations to take a "systems approach" to nutrition, starting with an understanding of the resources of the average family and framing policies to help it achieve the highest nutrition possible for the family members who need it most.

This might involve encouraging the use of high yield farm technology; it also might involve development of seeds which increase nutritional value as well as quantity; it would also certainly involve a heavy commitment to family planning and education, and a severe resistance to naivete over the administrative, political, economic and social agonies which are sure to attend the process.

Such advice, to be sure, seems to hold forth little reason for secure optimism about the food problem. But perhaps that is the point: Chances are not very great that population-food disasters of some sort will be avoided in the future in some parts of the world. And with frustrated expectations an increasingly explosive social force, there is only danger in a rhetoric which suggests that salvation is at hand.

Mr. Anderson is a member of the Journal's editorial-page staff.

enough rice to become an exporter. India increased wheat production 50%, leading Mr. Brown to predict self sufficiency in food for India by 1972, barring serious political troubles. Ceylon's rice crop increased 34% in the past two years because of the new seeds, Mr. Brown says, and the Philippines, Turkey, Burma, Malaysia, Indonesia and Vietnam have also scored impressive green revolution gains.

Though he acknowledges there still are formidable problems, Mr. Brown cannot resist some ecstatic conclusions. The new seeds, he says, mean that "it is realistic to consider the eradication of hunger for the overwhelming majority of mankind." They "promise to improve the wellbeing of more people in a shorter time than any other single technological advance in history."

As might be expected, such statements soon enough gave rise to skepticism, not over the unquestioned ability of the new seeds to increase food production if handled properly, but over the belief that their impact can be great enough to reverse the drift to famine and chaos. That the new seeds can be the subject of sharply differing interpretation is indicated by the experience of India.

The Rockefeller Foundation recently put out a lushly illustrated 137-page report on food production gains in India which states hopefully that "India's food supply is currently gaining at the rate of 4% a year with 5% well within grasp. . . ." The skeptics suggest no such trend is discernible.

To be sure, in 1967 and 1968, a bumper harvest in India followed two disastrous years of drought and famine. By Indian government figures, output of food grains totaled 95.6 million tons, topping the previous high reached in 1964-65 by more than 7%. It seemed to justify claims that the new seeds were making a difference, even with the improved weather of 1967-68.

But last year, production declined by about 1%. Indian and U.S. Agency for International Development officials are estimating that the tally for the current 1969-70 harvest will approach 100 million tons, but some who follow the situation find little reason to believe it will rise above 97 million tons. Even if it does reach the 100 million ton level, the average annual increase for the two years since the 1967-68 harvest will be about 2.5%.

A Rockefeller Foundation spokesman says the claim of a 4% to 5% rate of increase is justified in part because the Indian government tends to understate actual yields, perhaps for fear of diminishing the sense of urgency over food needs. "We think they actually reached 99.5 million tons back in 1968," he says. An AID spokesman explains that their economists project average increases of 4% to 5% based on known factors such as acres planted with the new seeds and amount of fertilizer used, but discounting such large variables as the weather.

Skeptics and Statistics

The skeptics have another point, however. The figures for total food production, they say, are not nearly as meaningful as figures for food availability per capita, the actual index of how the race against famine is progressing.

After last year's slightly reduced harvest, by Indian government figures, food availability per capita stood 8% below its level after the 1964-65 harvest, before the green revolution was supposed to have occurred. The Rockefeller Foundation spokesman responds that taking the availability figures back to the time of Indian Independence in 1948 shows them to have remained relatively constant, but adds that the calculations include shipments of food from other countries under foreign aid programs.

In any case, the skeptics suggest, whatever the amount of the increases, the circumstances under which they were achieved seem too artificial to merit revolutionary-sounding labels. The most dramatic yield increases have occurred in wheat, but in 1964-65 wheat comprised only 16% of total cereal production in India. The "miracle" seeds are available for rice, which accounts for about half the Indian cereal crop, but increases in rice yields in India have been minimal. And in some places, increases seem to have occurred more because marginal lands were put into use, rather than because the new technology increased the output of acres already under the plow.

The skeptics also claim a certain artificiality is inherent in the way the Indian government handled the new technology.

In 1966, a drought year, the new seeds were still relatively scarce, as were the fertilizers necessary to their success. Rather than distributing them throughout the country, the government sought to concentrate them in 32.5 million acres of the country's best land. This turned out to be Punjab, where, most agree, farmers are well off and more "progressive" than in other areas.

Even more serious, some doubters note, is the matter of the green revolution's effect on birth control programs. Nobody contends that higher food production is an alternative to population control; the most optimistic green revolution advocates say the combination of more food and birth control might be a way to avert population disaster. Mr. Brown rather naively asserts that "the new seeds have bought time in which to seek a breakthrough in contraception comparable to the breakthrough in plant breeding."

But, the skeptics point out, if anything, the talk of green revolution makes the possibility of such a breakthrough less likely. In the year following the 1967-68 harvest in India, with green revolution rhetoric as abundant as the new crops, the number of contraceptive loop insertions in India fell 31% over the previous year, and the number of sterilizations fell 13%.

A direct causal link is impossible to prove, of course, but William Paddock, a Washington agriculture expert who also tends to a pessimistic view of the food problem, perhaps sheds some light in a recent article in which he described a conference on the green revolution.

Mr. Paddock writes that someone had brought a Philippine farmer to the meeting to testify about his experience with the new seeds. "The farmer had 10 children and said that because of the new high yielding variety, of life, and we need to think in terms of putting a value on the quality of life in developing countries just as we are beginning to think about doing it for the United States."

Mr. Cantor advocates advising developing nations to take a "systems approach" to nutrition, starting with an understanding of the resources of the average family and framing policies to help it achieve the highest nutrition possible for the family members who need it most.

This might involve encouraging the use of high yield farm technology; it also might involve development of seeds which increase nutritional value as well as quantity; it would also certainly involve a heavy commitment to family planning and education, and a severe resistance to naivete over the administrative, political, economic and social agonies which are sure to attend the process.

Such advice, to be sure, seems to hold forth little reason for secure optimism about the food problem. But perhaps that is the point: Chances are not very great that population-food disasters of some sort will be avoided in the future in some parts of the world. And with frustrated expectations an increasingly explosive social force, there is only danger in a rhetoric which suggests that salvation is at hand.

Tax Report

A Special Summary and Forecast of Federal and State Tax Developments

W-S-J 10/7/70

SMALL-TOWN tax coffers rarely gain when industry comes to town, a study concludes.

A new factory may bring sorely needed jobs and boost local businesses, but it will probably cost local governments more for additional services than it provides in higher tax receipts. That's the conclusion of a study for the Agriculture Department of five little towns in Kentucky. All five rural areas were heavily dependent on farming, low in income, and afflicted with serious underemployment.

The study compared tax receipts before and after a new industry came to town. In almost every case, the increased revenues failed to cover the cost of additional services. The shortfall was generally small, however, with the largest only $3,400 a year. The factories usually hired local people, but even a moderate influx of new families saddled the school district with more new expenses than new revenues. Another negative factor was tax concessions—various forms of relief from local property taxes.

The study tried to gauge the indirect effects of industry by comparing similar towns that lacked industry. It found no evidence that industry indirectly affected either tax receipts or expenditures.

Looking Back

Radical Historians Get Growing Following, Dispute 'Myths' of Past

They Alter Image of America For Some; Town Meeting Attacked as Undemocratic

Picking Facts to Fit Theories?

10/9/71

By A. KENT MACDOUGALL
Staff Reporter of THE WALL STREET JOURNAL

True or false?

The town meeting in colonial New England was a hotbed of democracy.

Big business in the 1880-1920 era bitterly fought government regulation of railroads, meat packing, banking and other industries. .

The Soviet Union broke the Yalta agreements and, in a ruthless bid for world domination, launched the Cold War.

For every true answer, score yourself duped by the standard American history textbooks assigned in high schools and colleges. Or so, at least, contend an increasingly influential group of leftist historians who are challenging traditional notions about the nation's past. In exposing alleged myths that they say have prettified the American past and misled Americans into accepting their heritage as nearly unblemished, the radical historians are seeking to shed new light in dark corners.

While many historians disagree with the radicals, many Americans are listening, and the radical scholars are altering the image that some Americans have of their country and its historic leadership. "Radical historians have made us distrustful of people in high office and of the military-industrial complex," says Alexander DeConde, professor of history at the University of California at Santa Barbara. The radical writers are also diminishing "the almost holy trust of the executive power, particularly in foreign policy" that has existed in academic circles since 1945, contends Prof. DeConde, who isn't himself a radical.

Town Meeting Autocracy?

The radical historians challenge some of the most cherished concepts held by most Americans. For instance, a common history textbook tenet is that the New England town meeting was a model of democracy. Not so, insists Jesse Lemisch, a radical historian at Roosevelt University in Chicago. Prof. Lemisch cites studies that detail "the devices which the powerful used to control the town meeting" and points out that towns commonly exiled "political, ideological and social deviants and dissenters, as well as many of the poor. Thus, the apparent consensus within the town meeting reflects the exclusion from the town of those who didn't fit the consensus."

Though most historians have viewed early 20th Century Progressivism as a movement of small businessmen, farmers and reformers to break up trusts and regulate big business, left-wing scholar Gabriel Kolko has devoted two books to a contrary thesis: Leading corporations sought, rather than fought, federal regulation. The aim of these companies: To escape Populist-backed state legislation and to end price cutting, raids and other forms of increasingly destructive competition. "Progressivism was not the triumph of small business over the trusts, as has often been suggested, but the victory of big businesses in achieving the rationalization of the economy that only the federal government could provide," concludes Mr. Kolko, an American teaching in Canada.

A number of liberal and leftist scholars, including Mr. Kolko, have also persuaded many to distrust seriously the orthodox view that Soviet duplicity and expansionism were overwhelmingly responsible for the Cold War. These "revisionist" historians contend that the Soviet Union, terribly weakened by World War II, sought little more than security within a relatively narrow sphere of influence. Far from menacing Western Europe or other parts of the non-Communist world, the Soviets simply resisted U.S. efforts to oust them from Eastern Europe, these historians conclude.

Business and Diplomacy

This thesis fits the radicals' view that 20th Century American diplomacy has been counterrevolutionary. With the closing of the Western frontier in the late 1880s, American capitalism began to look increasingly overseas, the radicals argue. Needing ever-expanding markets and sources of raw materials, U.S. capitalism sought to expand commercial interests into practically every corner of the globe, the historians say. They believed that making the world safe for U.S. overseas investments and extending U.S. political influence was the job of dollar diplomacy, of which the Cold War with Russia and the current hot war in Indochina are but the latest phases.

Radical though these views may be, the left-wing historians are gaining increased acceptance, both within and without the profession. Lloyd Gardner, a diplomatic historian who describes himself as a Socialist, was invited to speak last fall on U.S.-Soviet relations at the U.S. Military Academy at West Point. Recently, a congressional committee heard Oregon State University Professor William Appleman Williams, dean of left-wing diplomatic historians, expound his view that "the Vietnam war definitely isn't an aberration but a logical culmination of U.S. expansionism."

The respectful hearing he received was especially pleasant for Mr. Williams, since his only previous contact with Congress was a run-in with the old House Un-American Activities Committee. (In the early 1960s, the Committee subpoenaed a Williams manuscript, but the historian and his lawyers successfully fought the demand.)

Radicals are also gaining influence in the traditionally conservative American Historical Association, and they are becoming increasingly common on many campuses. While few teach in the West or South, nearly every major Midwestern and Northeastern university has at least one resident radical historian. Northern Illinois University in DeKalb has three or four. The University of Rochester (N.Y.) has five or six, including the department chairman, Eugene Genovese, a Marxist.

Lloyd Gardner, the diplomatic historian who spoke at West Point last fall, heads the 25-member history faculty of Rutgers University. "I guess that indicates either that I'm not very

Looking Back: Radical Historians Get Growing Following

Continued From First Page

dangerous or that the perspective from which you write history doesn't matter much any more," says the 36-year-old Socialist.

Even some leftists who were *persona non grata* during the McCarthy era have recently won teaching posts. One is Herbert Aptheker, a Communist Party polemicist and well-known scholar of Negro history, who has written some 20 books. In the past, Mr. Aptheker was barred not only from many teaching positions but also even from speaking engagements. But today, professional historical associations invite him to deliver papers. And since 1969, he has been teaching black history part-time at Bryn Mawr, the exclusive women's college outside Philadelphia.

Losing Tenure at Yale

Yet some leftist historians still have trouble. After strongly denouncing U.S. involvement in Vietnam and making a visit to Hanoi, Staughton Lynd lost his job at Yale University. "Political factors entered into the history department's decision to deny me tenure," Mr. Lynd says. The department says it bent over backward to accommodate Mr. Lynd and says politics wasn't a factor in the decision. In any event, since the denial of tenure, the history faculties of five universities in Illinois and five more in Indiana have recommended Mr. Lynd's appointment, but in each case the school administration or board of trustees has refused to hire the historian.

That the 41-year-old scholar remains jobless dismays many historians. Says David Donald, a political convervative and Pulitzer Prize-winning historian at Johns Hopkins University: "Judged by any standard, Lynd is a historian of extraordinary ability, and it is a disgrace to the profession that he doesn't hold an appointment at a major university."

But Mr. Lynd isn't sure he wants to return to academia because, he says, "my present work seems more significant." Mr. Lynd currently encourages steelworkers in the Gary, Ind., area to recount orally, and sometimes in writing, the often bloody labor struggles they've experienced and to theorize on reasons for the declining militancy of unions they helped organize. He has also involved in history-writing projects steelworkers' children who have gone to college and are disdainful of the mills.

Building Pride in Gary

"History can give these young people a sense of pride in their community," Mr. Lynd says. "Besides thinking of Gary as one of the world's most polluted cities, they also can think of it as a place where some dramatic struggles took place." Noting that the youngsters often look on their parents as "failures because they didn't make it out of the mill," Mr. Lynd contends that history can give young people respect for their parents' lives. "I'm trying to help fathers and sons talk to each other," he says.

Mr. Lynd believes that conventional histories are elitist because they slight the underdog, and other radicals agree. "In our times, as in the past, we construct 'history' on the basis of accounts left by the most articulate, the most privileged members of society," according to Prof. Howard Zinn of Boston University. "The result is a distorted picture of how people live, an underestimation of poverty, a failure to portray vividly the situations of those in distress."

Adds Jesse Lemisch, the Roosevelt University historian: "You can no more write the history of the American Revolution solely from the official papers of John Adams and George Washington than you can write the history of U.S. involvement in Southeast Asia solely from Lyndon Johnson's papers." Mr. Lemisch is currently writing a history of the American Revolution from the perspective of merchant seamen. Its title: "Jack Tar vs. John Bull: the American Revolution Seen From the Bottom Up."

Despite the obvious handicap that laborers, poor farmers and other submerged groups left few records, some radical historians are trying to reconstruct the lives of these people. Some are reconstructing slavery from accounts not of slaveholders but of fugitive slaves. Others are discussing the plight of American Indians from the viewpoint of the Indians themselves.

The history of women also draws increased attention. The Cambridge-Goddard Graduate School for Social Change, a new, experimental Cambridge, Mass., institution, offers courses in radical feminist studies and recently awarded master's degrees in women's history to five women.

"The history of the U.S. to date has been the history of white, Anglo-Saxon, middle and upper-class men," contends Eric Foner, a leftist historian at Columbia University. "But when you add up the history of blacks, immigrants, women, Indians and poor whites, you find it's the history of most Americans," he says.

Seeing history through the eyes of the downtrodden leads today's young radical historians to emphasize economic, political and social conflict much more than did the so-called consensus historians of the 1950s. Leading consensus historians celebrated America as "a land that had largely fulfilled its promise and, with the great exception of slavery and the Civil War, had resolved its conflicts with a minimum of disruption and disorder," writes Irwin Unger, a liberal historian at New York University, in the introduction to an anthology of New Left history.

While radical historians disagree with the consensus history of their "establishment" colleagues, they often disagree sharply among themselves, too. For instance, Eugene Genovese, the University of Rochester historian, has won the respect of many fellow Marxists for his scholarship on the South before the Civil War. But he has raised hackles for his slashing attacks on political activists.

At the American Historical Association annual meeting in Washington, D.C., two years ago, Prof. Genovese opposed fellow leftist Staughton Lynd's unsuccessful candidacy for the group's presidency. He also opposed a strong antiwar resolution, which was also unsuccessful. "Some of the sponsors were looking for a political issue to advance their own image as heroes of the Left," he charges.

Mr. Genovese and Herbert Aptheker, who is also a specialist in the antebellum South, have exchanged invective. Mr. Genovese says he admires Mr. Aptheker's research in unearthing hundreds of slave revolts but dismisses his interpretations of these revolts as "romantic and politically self-serving." He contends that Mr. Aptheker often seeks for means to cast the working class in a favorable light.

Mr. Aptheker strongly denies the charge. But many other historians also complain that some of their radical colleagues write history to fit their political views. The problem with radical historians "is that everything has to be so relevant that they leave out things that don't prove their points," says David Donald, the conservative Johns Hopkins historian.

On the other hand, Mr. Donald says the leftist historians tend to avoid "the pedantic, irrelevant and dull writing that characterizes most American historical writing." And, he adds, "It's better to have a point and try to prove it than to have no point at all."

A Question of Ethics

Federal Judge Presides Over a Case Related To His Own Fortune

Friend Who Made Him Rich Is Involved, as Well as Bank In Which He Holds Shares

10/20/

But He Sees No Conflicts

By JIM MONTGOMERY
Staff Reporter of THE WALL STREET JOURNAL

NASHVILLE, Tenn.—Federal Judge Frank Gray Jr. built a small fortune after his friend John Jay Hooker Jr. invited him in on the ground floor of a hot business venture. The judge invested $2,000 and got out a few months later with profits of at least $100,000 and possibly close to $200,000.

Today Judge Gray presides over a bankruptcy proceeding involving Whale Inc., a corporation of which Mr. Hooker is a major stockholder, a creditor and a former director. Whale Inc. owes $3.5 million to a bank of which the judge is a shareholder. Judge Gray's brother is a vice president of that bank. Whale Inc. owes $16,456.66 to another bank of which the judge's wife is a shareholder.

Should Judge Gray disqualify himself from hearing and ruling upon the Whale case on the grounds of a multiple conflict of interest? The American Bar Association's code of ethics would seem to suggest he should. Many lawyers concerned about the commission or even the appearance of judicial impropriety certainly say he should.

But Judge Gray isn't budging. He says he wouldn't think of vacating the bench in the Whale case. He declares he sees nothing wrong in what he is doing, and he seems surprised that anyone else would.

A Question of Ethics

There is no evidence that the 62-year-old judge has done anything illegal. Indeed, there are no laws that categorically prohibit a judge from hearing a case in which he has a personal financial stake. But there are suggested guidelines and rules of ethics, and it is Judge Gray's ethics that appear open to question.

Consider, for example, Canon 4 of the ABA's rules of ethics for judges, which states that "a judge's official conduct should be free from impropriety and the appearance of impropriety." Canon 32 of the same code is more specific: "A judge should not accept any presents or favors from litigants, or from lawyers practicing before him or from others whose interests are likely to be submitted to him for judgement."

Judge Gray did not just "accept" a favor from Mr. Hooker, a lawyer who had practiced in his court. He actively solicited that favor.

Continued From First Page

already told Judge Gray that he doubts he will be able to devise a plan of reorganization to save the company. If he doesn't the judge will have several choices, among them declaring Whale bankrupt or taking the case under advisement.

Impartiality is highly important in the type of bankruptcy proceeding at issue here because of the absolute powers wielded by the judge. He can, for example, reject any reorganization plan submitted by the trustee, or he can order the trustee to draft a new plan even when the trustee insists it can't be done. He even had the power, at the time the company filed its petition, to deny the request for reorganization and to force the company into bankruptcy.

In the view of some attorneys, Judge Gray should have foregone all such choices and excused himself from the Whale proceeding altogether.

Typical is Fyke Farmer, a Nashville attorney. He says that even should the judge rule evenhandedly, his acceptance of "a very substantial favor" from Mr. Hooker lends at least an appearance of judicial impropriety that reflects discredit on the courts.

However impartially the judge handles the case, Mr. Farmer says, there could be suspicions that he favored the Hookers, as well as the banks in which he himself has an interest. Moreover, he says, there is the opposite danger that Judge Gray might bend over backwards to avoid favoring them—and thus do a disservice to the Hookers and the banks.

Charles Morgan Jr., southern director of the American Civil Liberties Union and an outspoken advocate of stricter rules on judicial ethics, won't comment on the Gray case because he says he's not familiar with the details, but he says laws are needed that would prevent Federal judges from even a hint of conflicting interests. He would like to see "a Congressional requirement" that appelate and district judges convert *all* their investments into Government securities upon assuming office. The Government bonds should then be "held in trust during their tenure," he believes.

Vague Guidelines

Mr. Morgan concedes such a requirement might impose financial sacrifice on many a jurist, but in his view the honor inherent in holding a judgeship should make up for that. "After all," he says, "they are appointed for life, and all men who serve their country must pay the price of patriotism." (The price, in this instance, is hardly a vow of poverty—Federal judges make $40,000 a year and up.)

Most critics wouldn't go quite as far as Mr. Morgan, but nearly all agree that present strictures on a jurist's financial pursuits are not only inadequate, but also so vaguely stated as to be all but meaningless. Several times in recent years Federal jurists have become publicly embroiled in ethical questions concerning their own finances—almost always with unfortunate consequences for the judges involved and almost always involving matters for which no clear-cut rules or prohibitions existed. That neither Abe Fortas nor Clement Haynsworth sit on the Supreme Court today is due in large part to exposure of financial ties that caused their integrity to be questioned but that did not break any laws or violate any professional code.

A Judge's Holdings Open Case Anew—After He Dies

By a WALL STREET JOURNAL *Staff Reporter*

It is not true, of course, that dead men tell no tales. If the dead man was in life a judge, he may tell more once he's laid away than he was ever required to reveal while sitting on the bench.

That has happened in the case of Lamar Cecil, a U.S. District judge in Texas in the 1950s, whose death opened the possibility of reversal of a suit he had decided three years earlier.

The suit involved a patent infringement charge. Judge Cecil in 1955 ruled for the defendant, Humble Oil & Refining Co., and that was thought to be that. But when his will was probated in 1958, it was revealed that he owned part of a company that did business with Humble, that he and his wife had other oil interests bringing them income from Humble and that his wife had owned Humble stock until just before he tried the case.

Saying the judge should have excused himself from the case, the plaintiff asked to have the proceedings reopened. Now, after 17 years, the case is still in the courts with no end in sight. "Were Judge Cecil still alive, the case wouldn't still be in the courts because his interests in the oil business wouldn't be (publicly) known to this day," says Fred Parks, Houston attorney for the plaintiff.

cal for a man who practiced law in his small hometown for 33 years before being named to the bench. Judge Gray got his law degree from Cumberland University in 1928 and practiced in his native Franklin, Tenn., until 1961, when he was appointed a U.S. District judge by the late President Kennedy. From 1956 to 1958 he was a member of the board of governors of the Tennessee Bar Association, and in 1960 he was comanager of the late Estes Kefauver's campaign for reelection to the U.S. Senate.

Judge Gray says he asked to get in on the fried chicken franchise business when Mr. Hooker "mentioned to me in a casual conversation" that he was starting up such a venture and had contracted to use the name of Grand Ole Opry star Minnie Pearl, a name held in high regard in these parts. "I told him it sounded to me as if he had a good idea that might make some money and I'd like to get in on it," the judge says. "I told him I'd like to take a flyer in it."

Judge Gray was not the only prominent individual among the 106 favored persons selected by the Hookers to "take a flyer" in their venture by means of investment in a private stock offering. Others so blessed included another Federal judge, two Tennessee Congressmen—Richard H. Fulton and William R. Anderson—and former University of Tennessee football coach Doug Dickey. Ironically, when the stock was later offered to the public, residents of Tennessee couldn't buy it until it began trading on the over-the-counter market. The state of Tennessee refused to register it because it considered the $20 offering price "unfair and inequitable."

It May Get Stickier

yers concerned about the commission or even the appearance of judicial impropriety certainly say he should.

But Judge Gray isn't budging. He says he wouldn't think of vacating the bench in the Whale case. He declares he sees nothing wrong in what he is doing, and he seems surprised that anyone else would.

A Question of Ethics

There is no evidence that the 62-year-old judge has done anything illegal. Indeed, there are no laws that categorically prohibit a judge from hearing a case in which he has a personal financial stake. But there are suggested guidelines and rules of ethics, and it is Judge Gray's ethics that appear open to question.

Consider, for example, Canon 4 of the ABA's rules of ethics for judges, which states that "a judge's official conduct should be free from impropriety and the appearance of impropriety." Canon 32 of the same code is more specific: "A judge should not accept any presents or favors from litigants, or from lawyers practicing before him or from others whose interests are likely to be submitted to him for judgement."

Judge Gray did not just "accept" a favor from Mr. Hooker, a lawyer who had practiced in his court. He actively solicited that favor. The judge asked for and, as one of a select group of 106 persons, was granted the privilege of buying stock in Mr. Hooker's newly formed fried chicken franchise chain for $1 a share. (Mr. Hooker started the venture after he was defeated in an election for governor of Tennessee in 1966. He is trying again for that post in next month's election.)

After the judge bought his 2,000 shares, a two-for-one split reduced his investment to 50 cents a share and increased his holdings to 4,000 shares. Then the company was renamed Minnie Pearl's Chicken System Inc. and in May 1968 just under 400,000 shares of its stock were offered to an eager public at $20 a share. The offer was instantly oversubscribed, and the very first over-the-counter trades were made at a bid price of $32. By mid-July the high-flying chicken stock had soared to $56, and the price remained above $40 through 1968.

A Tidy Profit

Since then, it has plummeted. With another new name—now it's Performance Systems Inc.—the stock has attracted recent bids of around 37½ cents a share. Even that price, taking into account a three-for-one stock split declared after the first public offering, is equivalent to a pre-split price of about $1, double the judge's investment. Reports issued a few weeks ago by the company show why the stock plunged: It lost $30 million last year and $5 million in the first half this year.

The stock price plunge meant that hundreds of shareholders who bet on Mr. Hooker lost heavily. But not Judge Gray. The judge says he "made some money," on the stock, but he won't say how much. His private investment proceeds "are not a matter for public discussion," he says. But he does reveal that after holding his shares long enough to qualify for long-term capital gains (six months), he "sold most of it in 1968, not at the high ($56) and not at the low ($32)." Thus, the judge reaped gains of anywhere from 50 to 100 times his initial investment.

All that took on new relevance last May 20, when Whale Inc., a fast-paced little conglomerate involved in real estate, franchise-operating and metals, and also a Hooker enterprise, filed a petition for bankruptcy—before Judge Frank Gray Jr. in U.S. District Court for the Middle District of Tennessee here. There's no doubt that John Jay Hooker Jr. has a vital stake in the outcome of the case or that Judge Gray himself has a lesser stake.

Mr. Hooker and his brother Henry together hold the second largest block of stock in the crumbled corporation. At one point, Henry Hooker was president of Whale and both the brothers were directors and controlling owners. The two Hookers together are major creditors of Whale—the company owes them $1.5 million for which they hold a note—so they have a big financial stake in the outcome of the bankruptcy hearings.

A Political Impact

Also, the Hookers and a third party guaranteed $3,150,000 of a $3.5 million debt that Whale owes the Third National Bank of Nashville. That's the bank Judge Gray's brother works for and the one in which the judge himself owns stock that he says is worth "more than $5,000." His wife, the judge says, owns "about $6,000 worth" of stock in the Harpeth National Bank in nearby Franklin, Tenn., where the Grays live. That is the bank to which Whale Inc. owes $16,456.66.

Whatever action Judge Gray takes in the bankruptcy proceeding could also have an impact on Mr. Hooker's fortune at the polls on Nov. 3. The judge may well be called on to make a ruling before then. A hearing is scheduled for today, and the trustee in the case has

Please Turn to Page 24, Column 1

Mr. Morgan concedes such a requirement might impose financial sacrifice on many a jurist, but in his view the honor inherent in holding a judgeship should make up for that. "After all," he says, "they are appointed for life, and all men who serve their country must pay the price of patriotism." (The price, in this instance, is hardly a vow of poverty—Federal judges make $40,000 a year and up.)

Most critics wouldn't go quite as far as Mr. Morgan, but nearly all agree that present strictures on a jurist's financial pursuits are not only inadequate, but also so vaguely stated as to be all but meaningless. Several times in recent years Federal jurists have become publicly embroiled in ethical questions concerning their own finances—almost always with unfortunate consequences for the judges involved and almost always involving matters for which no clear-cut rules or prohibitions existed. That neither Abe Fortas nor Clement Haynsworth sit on the Supreme Court today is due in large part to exposure of financial ties that caused their integrity to be questioned but that did not break any laws or violate any professional code.

The lack of clear guidelines revealed by those two cases has spurred the ABA to appoint a committee that is currently drafting a new and stricter code of ethics for judges. It also led to the introduction of legislation in both houses of Congress that would more strictly govern the financial activities of judges.

For the time being though, about all a judge has to go on is a Federal law that requires that "any justice or judge of the United States shall disqualify himself in any case in which he has a *substantial* interest . . . or is so related or connected with any party or his attorney as to render it improper, *in his opinion*, for him to sit on the trial, appeal or other proceedings therein."

A Clear Conscience

The language of that law clearly leaves it up to a judge himself to decide if his own interests in a case are "substantial" or if his connections with the litigants involved are "improper."Just as clearly, Judge Gray has decided that his interests and connections in the Whale case are neither substantial nor improper. Indeed, he says he "will never take any case in which I have an interest." Regarding Whale, he says, "I could see no possible conflict of any sort. And certainly none has developed. I will participate in nothing in which I could be open to an appearance of conflict of interest."

But to many, he already is participating in such a situation. And though he talks freely when asked about his relations with Mr. Hooker and his stockholdings in banks to which Whale is beholden, those facts were not revealed in a report the judge filed in July listing his financial interests in institutions that are named parties in lawsuits he is hearing. The U.S. Judicial Conference, a policymaking body for the nation's 450 Federal judges, this year for the first time required that Federal judges file such reports.

The report Judge Gray filed covered the first half of 1970, but it did not list the banks involved in the Whale case in which he and Mrs. Gray hold stock. Technically he may have had no reason to list them, although some assessors think otherwise. The question reads: "Have you participated in the hearing or decision of any case, knowing at the time of such participation that you, your spouse or any member of your immediate family in your household had a financial interest in any of the named parties?"

Since the Whale case was a voluntary proceeding filed by the company itself seeking to reorganize under chapter 10 of Federal bankruptcy laws, Whale is the only "named party" in the title of the petition. But the names of the larger of the two banks in which the Grays own stock was included in the list of creditors involved.

A Fried Chicken Flyer

The only financial interest the judge listed in his July report related to a case involving National Life & Accident Insurance Co., a subsidiary of NLT Corp. The report discloses that Judge and Mrs. Gray "own stock valued at about $30,000" in NLT. In that case, the court was merely holding the proceeds of an insurance policy until a disagreement between claimants was settled.

Judge Gray's assessment of his personal wealth indicates that a good portion, if not most, of it is based on the proceeds of his relationship with Mr. Hooker. Other than his $30,000 of NLT stock and his bank shares, he says he and Mrs. Gray own stocks worth between $1,000 and $5,000 in each of 10 other companies, all of which he declines to identify. He puts the total value of those holdings at "about $30,000" and says his only other investments are "some municipal bonds," dollar amount not revealed.

Such modest wealth is probably fairly typi-

Hooker "mentioned to me in a casual conversation" that he was starting up such a venture and had contracted to use the name of Grand Ole Opry star Minnie Pearl, a name held in high regard in these parts. "I told him it sounded to me as if he had a good idea that might make some money and I'd like to get in on it," the judge says. "I told him I'd like to take a flyer in it."

Judge Gray was not the only prominent individual among the 106 favored persons selected by the Hookers to "take a flyer" in their venture by means of investment in a private stock offering. Others so blessed included another Federal judge, two Tennessee Congressmen—Richard H. Fulton and William R. Anderson—and former University of Tennessee football coach Doug Dickey. Ironically, when the stock was later offered to the public, residents of Tennessee couldn't buy it until it began trading on the over-the-counter market. The state of Tennessee refused to register it because it considered the $20 offering price "unfair and inequitable."

It May Get Stickier

To the judge, all that is water long under the bridge and should have no relevance to the case he is currently hearing. But there is a chance that the Hooker brothers' involvement in the Whale case may yet deepen and that they may be dragged into it as defendants and not just parties related to a bankruptcy proceeding. That's because of a claim filed in the court by one John L. Peterson, charging the Hookers and another party with "fraud and misrepresentation."

Mr. Peterson, of nearby Williamson County, claims he was victimized in a stock deal in which Whale acquired a company from him. He claims the Hooker brothers gave him 29,000 shares of Whale stock as part payment for his firm, and he says when he tried to sell some of those shares he was told they were not registered and thus not marketable. Another factor that makes that transaction seem peculiar, Mr. Peterson says, is that the Whale annual report for 1967 says Whale bought his company not for stock but for $55,000 in cash. That's news to him, he says. John L. Chambers, attorney for the Hooker brothers, says, "there is no truth whatsoever in the charges. There were no misrepresentations made by the Hookers. There was no fraud practiced by the Hookers."

Judge Gray says he hasn't asked the U.S. attorney here to investigate the fraud charge because he's waiting for a hearing to examine the evidence. Mr. Peterson at first hoped he could work out a settlement with the court-appointed trustee of Whale, but he says he has given up on that and now wants a hearing. His attorney says he plans to ask Judge Gray to set a hearing date soon.

U.S. Attorney Charles Anderson says he could initiate action in the case himself, but he has been waiting for someone else to do so. Some sources here reason that Mr. Anderson, a Republican appointee, is reluctant to start a probe into the affairs of a Democratic gubernatorial candidate during an election campaign lest his office be accused of conducting a political vendetta.

The other Federal judge that Mr. Hooker sold stock to privately has also come under criticism for his dealings, but, like Judge Gray, he denies wrongdoing. He is William E. Miller, who recently was elevated from the District court here to the Sixth Circuit Court of Appeals in Cincinnati. In a Senate hearing on Judge Miller's appointment last March, attorney Farmer—the one who says Judge Gray should step down from the Whale case—charged that Judge Miller tried to circumvent Federal laws when he bought stock from Mr. Hooker.

The stock for sale in the initial private offering was offered to Tennessee residents only, but Judge Miller wanted to buy shares for his daughter, a resident of Virginia. When the transfer agent told him he couldn't do that, he bought the shares in his own name. When he later sold them, his daughter recieved the proceeds and paid the capital gains tax.

Judge Miller says he was not dodging the intent of the law. "I did not violate or circumvent any law," he says. He said the same thing at a Senate Judiciary Committee hearing conducted by Sen. Roman Hruska, and the committee agreed. It found "no basis for the charges" and confirmed the appointment, leaving vacant Judge Miller's former post of Chief Judge of the U.S. District Court here. That vacancy was filled—by Judge Frank Gray Jr.

Canadian Rail Carloadings Rise

OTTAWA—Canadian rail carloadings in the nine days ended Sept. 30 rose 13.6% from a year earlier to 113,446 cars, the Bureau of Statistics said.

Western carloadings rose 24.8% to 46,751, while loadings east of the lakehead were up 6.9% to 66,695. Carloadings in the year ended Sept. 30 were up 6.4% to 2,872,936 cars.

Doctors' Dilemma

British Physicians Fault National Health Plan But Say Sick Benefit

Pay, Low Prestige Disturb Them, but They Can Treat Without Regard to Cost

Mr. Whitnell's Aching Back

10-21-70

By NEIL ULMAN
Staff Reporter of THE WALL STREET JOURNAL

LONDON—The sign on the dingy south London storefront says SURGERY. In England that's a doctor's office.

The street door opens into a crowded waiting room. Patients, wearing the shabby shoes and neat, worn clothing of London's working class, sit on plain, wooden chairs that line the walls.

In back the doctor's 12-foot-square office contains a desk, an examining table with a plaid blanket covered by a paper sheet and a home bathroom scale. Medicine boxes and bottles are arranged on the mantel over a blocked-off fireplace and jumbled on a battered metal cart. The walls are scarred and spotted; cigaret ashes litter the carpet.

"If you think this is bad, you should see some of the other surgeries around here," says the distinguished-looking, 61-year-old Dr. Carl Burns (a pseudonym) as he greets a visitor. Like many of Britain's 23,000 family doctors, Dr. Burns is far from satisfied with conditions of practice under the government-controlled National Health Service.

No Complaints

But George Whitnell, a 32-year old warehouseman seated by the dripping umbrellas in the waiting room, isn't complaining at all. He suffers from chronic back trouble, sees Dr. Burns frequently and has been referred five times in the last eight years to London hospitals for physiotherapy. Beyond a weekly contribution of $2.12 deducted from his paycheck, none of this has cost Mr. Whitnell a penny. "I think it's terrific," he says.

All of which pretty well sums up the position of physicians here as National Health enters its 23rd year and as debate grows in the U.S. about adopting some sort of government-subsidized medical care plan. On one hand British doctors take pride in having brought effective health care to vast numbers of their countrymen. "The greatest advantage—the greatest satisfaction—is being able to prescribe whatever I think is needed without having to worry whether the patient can afford it," says Dr. Burns. "In that sense I can provide the best of medical care."

But doctors here are also painfully aware that mass medicine often reduces the doctor-patient relationship to its lowest common denominator; this, in turn, can bring hurried, uninspired health care. Though they basically defend National Health, physicians maintain a constant barrage of criticism in medical journals. Their complaints center on low pay and poor working conditions. Some 450 medical men are expected to leave Britain this year to practice elsewhere, continuing a steady talent drain.

The Cost Is High

The present health program was conceived during World War II and put into effect in 1948. It replaced a far more limited national health insurance scheme that had been in effect since 1911. The insurance plan covered only wage-earners—not their families—and paid only for general practitioner care. It was financed by deductions from the workers' pay and by contributions from employers.

National Health, in contrast, is financed largely through direct taxation. It has been expensive. The system is expected to cost the equivalent of about $4.2 billion this year, or more than 10% of all public expenditure, compared with about $1.1 billion in 1950. Weekly contributions of individuals and employers cover about 10% of this cost. Taxation pays for most of the rest.

So vast has the expense of National Health grown, in fact, that proposals to begin charging small fees for some doctors' services are currently under study by the new Tory government.

Family doctors, or GPs, are only one part of the National Health Service. Its other components are the Hospital Service, staffed by doctors on government-fixed salaries, and the "Local Authorities," or municipal health services that provide home nursing, immunization, psychiatric counseling, ambulance service, aid to the blind and other care that usually comes under the heading of welfare in the U.S.

"Independent Contractors"

Although paid by the government, Dr. Burns and his fellow GPs aren't salaried. Rather, they consider themselves independent contractors. For agreeing to treat patients under National Health, Dr. Burns gets a "basic practice allowance" of $2,760 a year. Added to this are an allowance of $550 for agreeing to take on extra tasks, such as holiday calls, a bonus of $480 for practicing in a group and $1,800 in seniority pay. He then gets a payment, called a capitation fee, of $3.60 for every patient on his list over 65 years old, plus $2.58 for all other patients. On top of all these allowances, Dr. Burns gets an additional 20% bonus. The government began adding the bonus to all basic allowances in June; in effect, it's a 20% pay raise for all National Health practitioners.

Dr. Burns has managed to amass a total of nearly 2,800 steady patients, well under the National Health limit of 3,500 per doctor but above the national average of 2,300 per man. The practice will thus produce a pretax income of $11,500, after allowing for expenses. In comparison, the average American GP has pretax income of roughly $30,000, according to the American Academy of General Practice.

"The problem is how to make a reasonable living," says Dr. Burns, who occupies a modest apartment in one of London's better residential areas. "The only way to improve your income is to take on more patients. But the more you take on, the less time you have to give them. And there still isn't enough money left over to buy equipment and improve your premises."

With pay basically the same regardless of where a doctor practices, some locations are

Please Turn to Page 33, Column 1

Doctors' Dilemma: British MDs Fault Health Plan but See Benefits

Continued From First Page

more popular than others. Dr. Burns' south London practice has some drawbacks that other physicians would find unacceptable. Because most of his patients don't have telephones, for example, he has found it nearly impossible to set up an appointment system. As a result, his waiting room is jammed, and he finds it difficult to give patients as much time as he would like.

So unpopular are some practices in grimy industrial centers that National Health pays an extra $960 allowance to doctors who agree to practice there. But that isn't enough for many young doctors, who would prefer to emigrate. "You can understand why a young graduate doesn't see his future filling in forms in a badly lighted, ill-heated, falling-down surgery in an industrial slum," says 30-year-old Dr. Ian E. Black, chairman of the Young Practitioners Subcommittee of the British Medical Association (BMA).

Until recently, Dr. Burns was one of the 4,500 physicians in this country who run their practices singlehanded. But solo practice was rugged. "There was barely enough money coming in to hire a secretary," Dr. Burns recalls. "When I wanted to get away for a fortnight's holiday in Israel, it cost me 55 pounds ($132) to hire a locum," or stand-in doctor. "Even then I had to worry if the locum was reliable, or if I might get complaints that my practice wasn't properly covered."

Pooling Resources

Spurred in part by the National Health bonus for physicians who practice in groups, Dr. Burns recently set up group practice with two partners. The partners hope their combined resources will enable them to buy better equipment and improve their offices.

Dr. Burns holds 10 "surgeries," or office hours sessions, a week. Each is scheduled for two hours, but many drag on to three hours and cover about 40 patients. If the patients' ills are minor, calling for medication, bandaging, examination or reassurance, Dr. Burns provides these within the limited time available.

In a typical morning surgery he approves a renewal of Mr. Whitnell's prescription for backache and checks up on a 53-year-old postman's post-operative recovery. In the afternoon he sets out in his compact 1969 Vauxhall to pay half a dozen house calls.

If a case requires more intensive investigation or treatment, Dr. Burns, like almost all GPs, refers the patient to a local hospital, where a specialist will diagnose and treat him. GPs view this "loss" of patients to the hospitals with mixed feelings.

A Spider in a Web

Dr. J. Leslie McCallum, a GP who practices in a middle-class London neighborhood, observes: "You can sit like a spider in the center of this web of medical facilities and lay on everything from extra milk for expectant mothers (at government expense) to complex surgery."

Dr. McCallum recalls one of his patients, a headmistress in a secondary school who suffered from severe arthritis in both hips. "I wrote a letter to one of our leading orthopedic surgeons in Manchester. He wasn't a personal friend, just a man whose published work on hip surgery I had read in medical journals. He agreed to see her and to perform an operation. So I have the opportunity to see that my patients get the best care in England."

But the system has its frustrations as well. Dr. Burns wishes he could do more himself—if only for the intellectual challenge, let alone the responsibility he feels to his patients. He remembers that his partner before the war spent a lot of time on his patients doing eye testing, X-ray work, urinalysis, microscopic tissue examination and the like.

"But now if one of my patients needs that kind of care, I have to refer him to a hospital," says Dr. Burns. "I don't have the equipment nor the time for these examinations."

Indeed, the average visit to a GP under National Health lasts six and a half minutes compared with 15 to 18 minutes for a GP office call in the U.S., according to the BMA and the American Academy of General Practice. However, the U.S. figures don't allow for the many Americans who see physicians in clinics and in hospital emergency rooms, which would tend to shorten the average visit length considerably.

The BMA's Dr. Black says he would like to see more beds set aside in British hospitals for use by GPs. Most doctors, he believes, don't mind losing their patients to the hospital when the skills of a specialist are required. But these same doctors are annoyed "when it's just a matter of needing hospital facilities for treatment within the scope of a GP's skill."

Only about 11,000 of Britain's 465,000 hospital beds are available to patients under a GP's care. This stems in part, some GPs charge, from the professional jealousy of physicians in the hospitals that take over the treatment of the GPs' patients. Many GPs feel they would benefit from more contact with physicians in hospitals and find the present situation demeaning.

Some Britishers, of course, have long preferred to bypass the National Health GP altogether and see a physician in private practice, on a paying basis. Even some of the National Health doctors have some private patients in addition to their government-sponsored practice. The government hasn't any objection, so long as the doctors don't mix National Health and private care in the same case.

Private Care Comeback

Indeed, private care is enjoying something of a comeback in this country. British United Provident Association, the largest private health insurer, says it covers 1.5 million persons, up from 750,000 ten years ago. Private Patients Plan, another insurer, lists over 152,000 subscribers, up from 55,000 in 1960.

But as to the quality of general practice, National Health GPs insist there's no difference in the care they give to private and National Health patients.

"I have one patient, a 14-year-old girl with an acute asthmatic condition," says a GP in rural Buckinghamshire, which is about an hour outside London. "I saw her this morning at her home, I'll see her tomorrow and I'll see her again on Tuesday. No private patient could buy better care than that."

Adds this doctor's partner: "The only difference so far as I'm concerned is that my private patients come in through the front door at mutually convenient appointments, and my National Health patients come in through the surgery door at surgery hours. I see them in the same place and give them the same care. There are just a few wealthy people around here who feel they would rather pay."

Nashville Jurist Steps Down From Case Involving Whale, Assails Journal Story

10/26/70 W-5-5

NASHVILLE (UPI)—Federal Judge Frank Gray Jr. excused himself Friday from a hearing on an offer to purchase most of the assets of Whale Inc. Tennessee Democratic gubernatorial nominee John J. Hooker Jr. is a major stockholder and former director of the concern.

Judge Gray said he would ask that another judge be assigned to the hearing because his brother is a vice president of Third National Bank, Nashville, which Whale owes more than $3 million.

Later in his chambers, the jurist assailed a Wall Street Journal story that said he had made between $100,000 and $200,000 from Mr. Hooker's business ventures. The story raised the question of whether he should disqualify himself from the case on the ground of conflict of interest.

"I was misquoted," he told UPI. "I got crucified." He added he thought he would have ground for a lawsuit if he had made a tape recording of his conversation with the Journal reporter.

Judge Gray received proposals Friday to purchase assets of Whale, a conglomerate, and Temco Inc., a subsidiary that makes gas appliances.

Nashville businessman William L. Bainbridge submitted an offer of $3.2 million for the Whale assets. Trustee Nile Yearwood said this money would go toward paying off the indebtedness to Third National and included $100,000 in administrative expenses.

The offer to purchase Temco came from Texas Clay Industries of Dallas. Judge Gray set a hearing on both offers for Nov. 6.

[Mr. Yearwood said Mr. Bainbridge's offer is for the Whale assets held by Third National Bank as security on its loans to Whale. The trustee said Whale's only other assets comprise some real estate in California which he has been unable to sell thus far. The offer for Temco, he said, is for $100,000 cash plus the assumption of more than $2 million of debt. Mr. Yearwood added that he will recommend approval of both offers if he can't find any better ones before the next hearing.]

"Since this hearing in connection with the Whale matter might involve some exceptions to an offer that pertains to Third National Bank, whether that develops or not, I am going to excuse myself from hearing that," Judge Gray said.

"However, I am fortunate in that another judge will be sworn in here next Monday and if he can't hear it, why, of course, the chief judge of the circuit can designate someone else," Judge Gray said.

Mr. Gray presently is the only U.S. district judge serving middle Tennessee. Leland McClure Morton of Knoxville will be sworn in today to fill the vacancy created by the elevation of Judge William E. Miller to the Sixth Circuit Court of Appeals.

The Wall Street Journal story said Judge Gray was one of a "select group of 106 persons" who bought stock in Mr. Hooker's fast-food franchising chain for $1 a share. It said he purchased 2,000 shares and received gains of anywhere from 50 to 100 times his initial investment.

The story quoted Judge Gray as saying his private investment proceeds "are not a matter for public discussion."

Mr. Hooker and his brother, Henry, hold a $1.5 million note on Whale, and they, along with a third party, guaranteed most of the debt that Whale owes Third National.

Mr. Hooker's franchising business was first known as Minnie Pearl Chicken Systems. The name was later changed to Performance Systems Inc. Mr. Hooker resigned as chairman of the board and chief executive of Performance Systems in August 1969.

struggle to find and hire black musicians.

Washington's National Symphony complains "raids" by larger orchestras have left it with only one Negro musician, down from three last season. The Cincinnati Symphony considers establishing an "apprentice program" to help train black musicians for full-time orchestra jobs. In New York, the Philharmonic hopes two Negroes recently added to its management staff will aid in recruiting black musicians.

The all-white Rochester Philharmonic says it has had only one Negro audition during the past two years. "By and large," contends a spokesman for the Cleveland Orchestra, black musicians "don't train for classical music." A spokesman for the Baltimore Orchestra notes that music conservatories are too costly for many Negroes. Most symphonies claim they're too strapped to provide scholarships for needy minority musicians.

New York's Philharmonic employs only one Negro among its 106 members. The 107-member Chicago Symphony has none.

FLAT CASE OF BIAS: A Syracuse, N.Y., cocktail waitress charges she was unfairly fired after being found "too flat-chested." She alleges this is sex discrimination. Her reasoning: "Chest size" wouldn't be a condition of employment if men were employed instead of women. The state Human Rights Division will decide the matter.

MOONLIGHTING EMPLOYES rouse the ire of few employers, a study finds.

A Conference Board survey of 136 concerns turns up only eight that explicitly forbid employes from working for other companies. Nearly 80% of those checked have no official policy either sanctioning or forbidding the practice. Even so, 82 companies place various informal constraints on moonlighting. Example: Employes generally are prohibited from working for competitors.

Twenty-four companies take an absolute "hands off" stance toward moonlighting. One reason: They figure the practice is inevitable because of rising living costs. Of 76 concerns expressing an opinion, 37 believe moonlighting is on the rise. Thirty-two see no change; seven report a decline.

Employes at a few companies are warned they won't get any disability benefits if injured while moonlighting.

* * *

THE CHECKOFF: Retail Clerks Union pickets at a Washington, D.C., drug store were joined recently by a lion cub bearing a sandwich board sign that implored passersby to "please respect our picket lion." . . . Seeking to improve employe morale, the usually secretive Central Intelligence Agency recently held a series of Saturday "open houses" at its McLean, Va., headquarters for wives and children of its workers. . . . The Ironworkers Union magazine features an article by Vice President Agnew entitled "In Defense of Hard Hats."

Lunch With 3 Prospective Bombers

W-S-J 10/27-70

By AMITAI ETZIONI

Last Sunday I met three would-be bombers, two young men and a young woman whom I'll call Jim, Dick and Sally. As far as I could tell, they have not participated in any terrorist act nor do they really intend to. Nevertheless, they were full of "hip" talk about "blowing things up," and they professed admiration for the Weathermen's actions.

"If I had my way, I would blow up the bridges and stifle Manhattan," Dick maintained.

Jim showed his expertise: "It would be easy to blow a hole into the T-Z (Tappan Zee Bridge), but it would not stop the traffic for long. On the other hand, it is more difficult to get to the cables of the George Washington Bridge. But if you got to those—you'd bring down the whole thing."

"It's not that difficult," Dick protested, "just four or five feet above the ground."

"Yes," Jim demurred, "but you could work *under* the T-Z and have as much time as you want, while everyone would see you working on the cable."

I interjected at this point. "What about all the people on those bridges?"

"They will be called," Jim explained. "We will tell them that they have 15 minutes to get off. We are after the property system, not the people."

"Well," I wondered aloud, "what about the janitor who was overlooked in the Queens Court House, and the young Ph.D. in the lab in Madison?"

Dick countered, in what seemed a complete non sequitur: "And what about all the death in Vietnam?"

Sally thought "that anyhow the banks will be first to be hit. I was afraid to go cash a check on Friday."

The conversation took place on a suburban lawn. The three young people were all under 30 but close to it. Dick is the son of a top executive of a middle-sized Manhattan firm. Jim is the son of a neighbor, a retired commodity broker. Sally is Dick's girlfriend.

A Shared Hatred

Both Dick and Jim come from families that are obviously well off but lead quite simple, almost hippie lives. The parents openly share their sons' hatred for "the system" and respond admiringly to most things "the children" come up with. Our hosts, Dick's father and mother, were matching their sons' extremist jargon. "The system is rotten at the core," explained the father in passing.

The youth rebellion is encompassing; it moves beyond politics and fashions in an entire life style. Dick is making films, in the Village, to promote "the cause," an activity that produces little income. Thus, at 28, he is living off his parents, sleeping late, hanging around the house most of the day and staying out late with one girl or another. Jim went to France to avoid the draft after flunking out of two law schools in the United States. He finally received a law degree from some little-known school, and is now studying law in New York City. He, too, lives at home, getting up at noon and studying at night. All three are surprisingly relaxed human beings. Sally's talk is almost slow. Dick and Jim seem as if they have all the time in the world. Sunday's lunch, which started at 2 p.m., stretched into the early evening hours. Large amounts of Sangria, Edam cheese and Spanish sausages with French bread were consumed. I saw no drugs. The youths wore their hair not much longer than Mayor Lindsay has of late. They were clean and sported no love beads. Without their faded jeans they could easily go unnoticed among any bank's clientele.

They may best be characterized as sympathizers, who far outnumber the actual bomb throwers in each revolutionary movement. They *can* be drawn into violent action, especially if they believe that the movement has a fair chance of succeeding in the struggle against the Government. On the other hand, as long as bombers are arrested fairly frequently and receive severe punishments, these sympathizers will stay on their lawns. They will still provide the hard-core terrorists with money, information, occasionally shelter and always with sympathy. They constitute the ocean in which the urban guerrillas swim.

'Doing Your Own Thing'

"What would you achieve by blowing up some banks or bridges?" I asked when coffee was served.

"Achieve?" Jim was indignant. "Man, this is an old-generation hang-up. Doing your own thing is what counts."

"Yeah," Dick concurred, "Shake it up. Show it up."

Sally surmised, "If people's washing machines would cease to work—power failures, you know—they could not take it, and they would finally rebel."

Here I almost erupted. "What nonsense. Let's forget for the moment the question of whether this country is ripe for, or is in need of, a revolution. What kind of strategy is this? What if you do blow up a few places? What will this amount to, what will it accomplish?"

"You can't tell," Dick replied. "You cannot plan a revolution. Do you think Stalin knew, when he robbed a bank, that it would lead to a revolution? When Lenin studied, did he visualize himself a revolutionary leader? You try things. You blow things up. If this won't work, we will try something else. Anyhow—now it is time to act. We are mad. . . ."

Sally spoke softly, describing her vision. "You get to the banks, which is where their money is. And to the Federal buildings and to the armories and to the bridges. . . . You blow it all up. . . . The people's confidence in their Government will be shaken and its legitimacy will be undermined."

"Oh, come off it," I said. "Blowing up a few windows, ceilings, and floors will have no such consequence."

This response, all three agreed, was mere rationalization—an excuse for passivity.

Upon leaving, it was clear to me that these youngsters, brought up in an ultra-permissive home, were rather different from the disciplined die-hards in the Old Left who spouted Marxist dogma in response to any or all questions. These youths in the New Left were apparently without a systematic ideology and lacked an overall strategy. They responded emotionally and instinctively to a few "cue" words, rhetoric that has more psychoanalytic connotations than political ones.

A Selfish Philosophy

To the extent that their philosophy emerged from this encounter, it appeared to be a selfish, indulgent one. There seems to be a willingness to approve of, if not to actually engage in, acts of violence without a clear sense of social purpose or consequence. All as if terror were a mere act of self-expression and spontaneity; planting dynamite, a form of finger painting. Societal processes go unrecognized in what is surely the most individualistic revolutionary talk since anarchism. Ultra-progressive education, hip talk and the use of mind-expanding drugs seem to have left these three unable to carry an argument to its logical conclusion. Moral considerations are brushed aside by pointing to the "evils of the system."

I wish I could conclude by saying that this or that course of action—changing our curricula in schools, subscribing to the latest edition of Spock (which is much less permissive than the earlier ones), hiring more policemen—would help these infantile would-be terrorists to grow up and face the social and moral consequences of the "ego-trips" they endorse so willingly. Granted, our educational system, child rearing practices, and social system and crime prevention techniques all are in need of extensive reform, but this will take time.

Meanwhile, many thousands of youngsters like Jim, Dick and Sally will be with us. One day their parents will cease to finance their games, and responsibility will set in. Then, perhaps, they will tire of playing revolutionaries. For the time being, however, the most we can do, I am afraid, is to make it as clear as possible to these would-be bombers that dynamite theatrics are utterly unimpressive modes of self expression and are of no societal consequence.

Dr. Etzioni is chairman of the sociology department at Columbia University and author of "The Active Society" (Free Press).

10-30-70

...go, this won't be ...
tion." PA, JW, AC, BW

CONTROVERSIAL MOVES by Nixonites, delayed now, will accelerate after election.

A November Inflation Alert will hit harder at labor and business. Pressure for adopting some sort of wage-price guidelines may grow, despite high-level resistance. A Pentagon settlement of Lockheed's C5A cost claims, sure to stir criticism, is due by the year-end. Coming rules intended to open up apprenticeships to minorities will nettle "hard hat" union men.

Urban-renewal changes coming after election will likely limit funds for big cities ruled by Democrats. Look for shifts in the Model Cities program to help poor whites, plus further efforts to dismantle the poverty-fighting OEO. A Thurmond protege may take over as Small Business chief; incumbent Hilary Sandoval has been busy wooing Mexican-American voters.

W-S-J 10/30/70

SAIGON'S DRIVE into Cambodia this week may be just a beginning.

U.S. policy-makers plan more action by South Vietnamese forces in case of any big Communist offensive against the Lon Nol regime. Americans will provide support, if necessary, for Saigon's fighting men. Washington evidently feels the loss of Cambodia would be unacceptable—because of peril to the war effort in Vietnam.

The intervention, even without U.S. troops, could stir new opposition at home. Options include: More big South Vietnamese raids across the Cambodian border; ringing Phnom Penh with Saigon troops to prevent capture; maybe even sending them into Laos to cut Red supply lines. Some plans would entail U.S. air support, supplies, transport.

Some U.S. officials dissent. They foresee more domestic political harm than military gains, worry that the U.S. will get dragged in deeper.

CASH POURS IN for Conservative Party candidate James Buckley's New York Senate campaign. Wealthy Republicans chip in, spurred by polls indicating Buckley victory, plus an indirect Nixon endorsement. Buckley triples his TV ad budget, to $150,000, for the final few days. Democrat Ottinger slugs harder now. Republican Goodell seems out of the race.

HAPPY THRONGS of servicemen win early discharge from the armed forces. The number getting out ahead of time could reach half a million this fiscal year, rivaling last year even though total troop strength is down. Some are men who can't be sent to Vietnam a second time; others are headed for college or police training.

LEARNING INCOGNITO: Saigon's new commander in the Mekong Delta shows unusual desire to master his job. Lt. Gen. Truong, moved from northern provinces, is little-known in his new region. Sometimes he poses as interpreter for his senior U.S. advisers; Truong figures he learns more from subordinates' soft-soaping of the Americans than from reading official reports.

ANTIPOVERTY CUTS loom. Economizers at the OEO aim to trim spending for Community Action programs to $306 million next fiscal year, down from $333 million this year and $358 million last year. Local agencies participating may have to put in larger contributions.

POLITICIANS TAILOR their speaking styles for television. Example: Democratic Senate candidate Tunney of California confides that he shifts from a "hot" platform approach to a "cool" delivery to project sincerity on the tube. "On television," he says, "you have to 'internalize' your message"—speaking quietly, deliberately, with feeling.

FEARS OF '72 spur the GOP's effort to snatch Senate control this year.

Party strategists realize the chances won't be nearly so bright next time. Nineteen Republican-held Senate seats and only 14 Democratic ones come up for grabs then; this year 25 Democratic and 10 Republican seats are at stake. At least eight Democrats facing 1972 reelection seem safe; most of this year's crop are vulnerable.

Many of the Republican seats up next time seem open to Democratic capture. Popular Sen. Cooper of Kentucky will retire; ailing South Dakota veteran Mundt could quit; Oregon's Hatfield talks of bowing out. Among Republicans facing possible 1972 peril: Miller of Iowa, Idaho's Jordan, Griffin of Michigan, Wyoming's Hansen.

Democratic Rep. Hathaway of Maine already serves notice that he'll run for Margaret Chase Smith's seat. He hopes that fear of defeat will prompt her to retire.

MINOR MEMOS: Why did Nixon abandon plans for a pre-election TV show from California with Republican candidates from across the nation? One reason: Candidates from the East didn't want to be in the West at the campaign's climax. . . . Boeing Co., following White House example, distributes copies of the conservative American Security Council's national security ratings of Congressional voting records: Democratic Sens. Kennedy, Hart, Tydings all get zero. . . . The Republican National Committee sends out samples of a "Spiro T. Agnew Speaks Out" recording; a full 40-minute disc goes to party members who contribute at least $10 before the election.

Out in the Cold M-UH

Increasing Layoffs Rob Many of Their Pensions As Well as Their Jobs

Eligibility Rules Often Bar Workers; Unions Pressing For More Liberal Programs

A White Collar Is No Shield

11-4-70

By JIM HYATT
Staff Reporter of THE WALL STREET JOURNAL

AVON LAKE, Ohio — At first glance 33-year-old Edward Herrera didn't fare too badly last April when he was laid off here by Fruehauf Corp. He eventually found a job paying $50 a week more at a nearby Ford Motor Co. plant.

Despite the higher pay, however, Mr. Herrera is still bitter about losing his old job. "I put in 11 years for nothing," he says. Because he was laid off well before age 40, when he would have become eligible for an eventual pension, Mr. Herrera took nothing with him when he left Fruehauf but his final paycheck.

As layoffs reach the highest levels in six years, and as corporations tighten their belts by closing plants, many workers like Mr. Herrera are learning that they're losing more than just their current jobs. Years of potential eligibility toward pensions are also evaporating. As far as earning a pension is concerned, many workers are, in fact, having to start their working careers over.

Private pension plans hold well over $100 billion in assets. About 17,000 such plans covering about 21 million workers are on file with the Labor Department, and several million workers are thought to be in plans not reported to the department. Pension plan coverage has become increasingly generous over the years —yet Congressional committees and others looking into pensions are discovering that because of high industry turnover even in good times, stringent eligibility requirements and today's widespread layoffs, many workers "covered" by such plans will never be eligible to collect a penny.

High Casualty Rate

Just how many workers lose out is a hotly debated question and no exact figures are available. "My very rough estimate is that it is quite possible that over one-third of all workers in pension plans will never get anything from them," says Michael S. Gordon, special minority counsel for pensions for a Senate subcommittee. "In some industries the ratio will be much higher."

Union officials estimate that Fruehauf laid off more than 1,000 workers in the final year of manufacturing at the plant here and say that at least 750 of them were let go short of pension eligibility requirements—age 40 and 10 years on the job.

Companies often try to save pension rights by liberal recall provisions or by offering workers jobs at other plants. But those choices often create a variety of problems. A Dallas man in his 30s was laid off recently by Texas Instruments Inc., where pension eligibility begins at 50. But he says it has been difficult finding another job because prospective employers fear he'll go back to TI if a recall occurs.

Other workers say alternate jobs are seldom offered on the best of terms. John Voss, a 38-year-old engineering aide, is two years short of pension eligibility at a General Dynamics Corp. division in Rochester, N.Y., and stands to lose perhaps $100 a month in potential pension when he is laid off late this year under a previously announced schedule. He says he might be able to get on with a nearby General Dynamics plant, "but I'd have to take a lot less pay." He also complains that "there's no telling when the other plant will lay off, too."

Small Comfort

Industry-wide "portable" pension plans often keep pension rights intact for workers who move to similar jobs, but in the current economy such plans are little comfort to many so covered. Evelyn W., a 40-year-old Cleveland woman lost a job last January as a packer at a sausage plant. Because of the business slowdown, "a lot of the other plants wouldn't even take an application," she says. She is 10 years short of being old enough to establish a pension right and figures she has lost a pension worth $70 a month at retirement. Currently she's taking accounting and secretarial courses at a junior college.

Layoffs hit especially hard at older workers who are dismissed short of retirement age. Jesse Stockton, 53, laid off after 23 years at Fruehauf, figures he'll never be eligible for another pension. At 65, he'll draw about $50 a month but working to 65 could have added another $36 a month to his check, union officials say.

Plant closings often take an even harsher toll on pensions already earned. An unexpected and sudden closing can leave a pension fund that doesn't even cover the built-up obligations already due workers. A classic instance: The 1963 closing of Studebaker Corp.'s South Bend, Ind., operations, in which several thousand workers with earned pension rights received only a small portion of the money they had expected.

Today's wave of plant closings is creating thousands of similar cases. Metals Forming Co., a unit of Gulf & Western Industries, is in the process of closing a plant in Ecorse, Mich., that employs about 175 workers. United Auto Workers officials say that because of the unexpected shutdown, only the most senior employes will get a pension.

Washed Out

In a letter to Congress last July, Leonard Woodcock, UAW president, asserted that "among the victims of that closing are a man and a woman, both 52 years old, each with 37 years of service. Their entire 37 years with the company were washed out as far as pension benefits are concerned."

A Gulf & Western spokesman says only that the company "intends to honor all provisions of its contract" and adds that "employes will receive the benefits to which they are entitled." That's true enough, the union says. The problem is that what they're "entitled to" is precious little.

The United Steelworkers of America says it recently talked one company into forking over an extra $35 million to bring a subsidiary's

Please Turn to Page 30, Column 3

Out in the Cold: Increasing Layoffs Rob Pensions From Many Workers

Continued From First Page

pension fund into balance after the subsidiary folded. Such instances are not isolated. Melvin Glasser, director of the UAW's social security department, says in one recent week alone the union had "four requests to terminate pension plans from employers going out of business." Some benefits will almost certainly be lost, he adds.

Some workers find, unhappily, that their employer's pension plans are so restricted that virtually no benefits are available. Olga Jensen worked about 18 years for a San Francisco marine transportation company that suddenly was liquidated a couple of years ago. She was 47 at the time and expected that she would receive some settlement from a pension fund for her years of service.

To her surprise, Miss Jensen found that the fund only paid a pension to employes working to the age of 65 and that when the plan terminated, her expected Social Security benefits were deducted before any pension was calculated. As a result, she got nothing. "It was more than shabby," she says. She worked for a time at another company but decided the risks of losing another pension were too great. Taking a pay cut, she moved to the U.S. Customs Office, where the pension provisions were more liberal.

Lower-level workers aren't the only employes encountering pension problems. "The loss of pension credits is spreading into new sectors," says Merton C. Bernstein, an Ohio State University law professor. "Manufacturers are laying off white-collar managerial people."

A 49-year-old middle-management official at Texas Instruments is less than a year away from meeting the age 50 pension eligibility requirement, but he figures his chances are "less than 50-50" of making it in the face of major layoffs by the Dallas company. "It's like being in an artillery barrage when they have you zeroed in," he says.

One 58-year-old bank executive in the Midwest was recently fired just 18 months short of having 10 years on the job, a requirement for a pension. Bitter about the treatment, he calls such requirements "archaic and obsolete." He adds: "A place like this constantly reminds you that maybe you don't get much pay but a big percentage of your overall compensation is in various benefits, including the pension plan. When they forfeit the pension they fatten their own purse."

A 44-year-old Cleveland banker, fired after seven and a half years, frets that "I'm half way through my working career and I'm starting over again on another potential pension. If you change jobs every 10 years or so, you're not a job skipper in any sense of the word. Yet two or three moves and you can effectively end up without anything at all."

Such problems are especially widespread among professional and technical people out of work due to defense spending cutbacks. "We're getting some pretty pathetic letters," says one California job retraining specialist. "Because of the ups and downs of our business, they suddenly find themselves near retirement, laid off, with no pensions." One study found the average engineer spends less than six years at any single job, far short of most pension eligibility requirements.

In boom times, of course, high-salaried engineers didn't worry about pensions. "I've been buying a little real estate and thought I wouldn't worry about pensions very much," says John R. Goodwin, 49, an aeronautical engineer who has had 11 employers in his career but has never qualified for a private pension. He lost his last job, which paid $17,500 a year, just three months short of qualifying for a plan.

With hundreds of his colleagues out of work, however, he finds his real estate holdings, including his own $45,000 home in a Los Angeles suburb, impossible to sell. He has taken some temporary $3-an-hour drafting jobs and hopes to do some consulting work, but he figures he has lost any chance of ever earning a pension. "As far as I'm personally concerned," he says, "I think the game is up."

Alarmed at such developments, unions are taking increasingly tough stances in negotiations, seeking to improve pensions even at the sacrifice of current wages. "Unions are saying it is senseless to stick money in the pay envelope just to let Uncle Sam get it," says Robert F. Rainey, supervisor of pensions and trusts for H. K. Porter Co., Pittsburgh, an industrial equipment concern. He figures his company's pension costs have almost doubled in two years.

The United Rubber Workers Union this year boosted pension benefits to $7.75 a month per year of service, almost 50% higher than the previous level. In October Owens-Illinois Inc., Toledo, signed a new three-year contract with the Glass Bottle Blowers Association that will boost pension benefits in 1973 to $7 a month from $4 a month currently for each year of service. The union represents most of the company's 20,000 employes in 18 glass container plants.

But fatter pensions alone don't protect workers from layoffs, so unions are also seeking more liberal eligibility requirements. A major issue in the current strike against General Motors is a UAW demand for a full pension of $500 a month after 30 years. GM has offered such terms for workers at age 58. " 'Thirty and out' could double pension costs," says one corporate official.

Pension disillusionment has led to considerable pressure in Congress for tighter Federal controls and looser eligibility requirements. One measure sponsored by Sen. Jacob Javits of New York would set up a reinsurance fund to pay benefits that employers couldn't cover in the event they are forced to go out of business. It would also create an independent pension commission, similar to the Securities and Exchange Commission, to handle pension regulatory matters.

Moreover, a number of unions and employes are seeking fully "portable" pensions. Such a system, already used by some unions with industry-wide contracts, permits workers to simply change jobs and carry their accrued pension benefits with them. White-collar workers caught in the economic downturn are particularly interested in such a plan. The American Chemical Society is exploring portability for its members, and an official of the American Institute of Aeronautics and Astronautics says: "I know of four companies that six months ago would have shot you if you stood on their property and uttered the words 'portable pensions.' These companies are now investigating it. The climate is changing."

Repression: It's Not Here Yet, but...

11-4-70 W-S-J

By DAVID C. ANDERSON

In a recent campaign speech, Spiro Agnew used an alalogy to describe how the Administration hopes to deal with political terrorism. "Just as we are stopping inflation without recession," he said, so will the Government seek to control political unrest without repression.

If the analogy is apt, it is also disturbing, perhaps because of the feeling it leaves that it may be far more apt than Mr. Agnew or anyone else would like to think. It is not yet clear that the Administration can bring inflation under control without deeper economic troubles, and there seems to be similar room for doubt about the idea of controlling terrorism without repression.

Even more disturbing, perhaps, is the fuzzy quality of the debate over the whole question. Mr. Agnew's comment was only a glancing reference; he never sought to develop the idea as a major campaign theme. And though some Democrats and others have voiced concern about the future of democratic traditions in America, few seem to see the issue very clearly.

There is great reason for confusion, of course, for the word "repression" is bandied with increasing carelessness. Its most fashionable use—by various kinds of radicals who assert that American society is repressive by nature—is largely unwarranted.

The Radical Impression

Repression in the radicals' understanding seems mostly a function of their own alienation, which has incurred the hostility of the larger society. One can argue over the merits of the alienation, and recognize that sometimes the hostility has led to illegal overreaction against the more flamboyantly alienated or those who profess openly to favor the destruction of America. But one cannot say that they are victims of true repression, which would involve the denial of free speech and due process as a matter of official policy.

The argument—or non-argument—fostered by the radical charges, however, too often seems to obscure a more legitimate cause for worry: The *potential* for true repression in America has risen to a troubling level.

The sources of the potential lie in some of the well chronicled changes of the last decade or so, whose long range meanings one can only begin to fathom.

There was the social-political change: Sustained prosperity, demographic shifts, the Vietnam war and other developments, all seemed finally to coincide at the end of the sixties in such a way that huge numbers of Americans began to grow disillusioned with the democratic process.

A new factionalism arose; in the extreme the left turned to militant intolerance and revolutionary violence; the right to overreaction and vigilantism. Though the actual anti-democratic behavior was limited to a very few, they could claim sympathy in some degree from large segments of the population; the Panthers. It's a mood, a tone, a license. The Justice Department sets a tone toward dissent, toward the Panthers. They circulate profiles of the leaders to the local police, there's a police raid in one city, and then another city gets the idea by example. . . ."

It may be pointed out, of course, that blaming Mr. Agnew for the Kent deaths amounts to gross oversimplification. The complex pot of campus and anti-war unrest was boiling vigorously long before he came along; he is entitled to his freedom of speech along with other Americans; and anyway, whatever his tone, much of what he says is true.

Furthermore, if there is an anti-Panther mood at the Justice Department, it is probably quite justified in the case of an avowedly revolutionary group with open ties to hostile foreign governments. Few, surely, would question an anti-Mafia mood at the Department—though, significantly, some Italian-Americans claim that it too has come to include unwarranted ethnic prejudice.

And, one must recognize, there is also a definite anti-police mood among the Panthers and other militants, a mood which could also be taken as the source of an informal, unconscious, nationwide "conspiracy" to snipe at the police.

But none of this should mean that Mr. Clark's concern is unwarranted. It is justified not because of any idea that the Panthers are unfairly pursued, but because the official mood may be taken by the pursuers as license to ignore the democratic guarantees normally afforded to any citizen, however criminal or revolutionary he may become.

In this light, for example, one may suggest that it is, after all, hardly essential for a well commanded, professional police force to make an arrest by opening fire on suspects who offer little provocation, as seems to have happened in a number of recent incidents between black militants and police. Or course it is true that the average policeman is only human; he may have trouble showing professional restraint because he has strong reasons for feeling contemptuous of the militants. But this is no excuse; rather, it is exactly the point.

Indeed, the tendency of the new politics and the new technologies to magnify the influence of the irrational in the democratic process ought to be taken very seriously by any responsible national leader. For even the appearance of undemocratic behavior sanctioned by official government may have implications as serious as the breakdown in respect for authority, and may even be a source of it.

If the problem is easy to state, however, it is difficult to grasp in practical terms.

How does a government restore a sense of maturity and perspective in an increasingly polarized society, especially when there are substantial arguments and deep feelings at both poles? What should it do about the impact of television, which can't, after all, be eliminated and shouldn't be controlled? How should it handle the use of the surveillance and information processing equipment, which has its essential and legitimate uses and which probably will be used by somebody, no matter what?

More germanely, perhaps, how does a leader keep from giving in to the powerful temptations to seek greater personal power from the polarized politics, or to abuse his access to the powers of communications and information he remains relatively free to command?

The questions are so unprecedented that a reporter bringing them up in a conversation with Richard G. Kleindienst, the Deputy Attorney General, and a man who claims to reflect the Administration's view of repression, finds him somewhat defensive.

Mr. Kleindienst concedes that unaccountable power of the Attorney General to authorize eavesdropping represents some dangers to freedom, especially when the eavesdropping is only for surveillance and not for use in court.

But the point, he contends, is that the Attorney General is a cautious man who is not about to misuse such authority. Indeed, he argues, since Mr. Mitchell is concerned with leaving a good record for the history books, his taking personal responsibility for the eavesdropping actually amounts to a check on his use of the power.

The President's Beliefs

Furthermore, he goes on, the President shares a deep sensitivity to the question of Constitutional liberties; his personal beliefs and attitudes actually are the best bulwark possible to prevent the collapse of American democracy as the far-out radicals stir up angry feelings of reaction.

And perhaps this reflects more of a policy than it seems at first glance. Whatever its sources or its dangers, the President clearly has concluded that the net result of the new changes is a surge of rightist feeling. And he seems to see his role, as Stewart Alsop suggested recently, as similar to that of Franklin Roosevelt facing a surge of leftist feeling: To accommodate and channel the new passions in ways that keep them from harming America drastically.

Thus the deliberate, rather than precipitate withdrawal from Indochina; the public embrace of the hard-hats; the tough-sounding anti-crime laws; the exhortations to the electorate to get back at the bombers and the "obscenity shouters" by voting for Republicans.

If this is a rational policy, however, one still cannot help a depressing feeling that the drift to repression, very much indeed like economic inflation, is stubbornly larger than government. For it is hard to see how a strategy of the right will do that much to reverse the impact of the technologies or wind down the escalation they abet of terrorism, fear and popular pressure for order. And history has shown, sadly, that the popular pressure will always prevail.

Mr. Anderson is a member of the Journal's editorial-page staff.

which would involve the denial of free speech and due process as a matter of official policy.

The argument—or non-argument—fostered by the radical charges, however, too often seems to obscure a more legitimate cause for worry: The *potential* for true repression in America has risen to a troubling level.

The sources of the potential lie in some of the well chronicled changes of the last decade or so, whose long range meanings one can only begin to fathom.

There was the social-political change: Sustained prosperity, demographic shifts, the Vietnam war and other developments, all seemed finally to coincide at the end of the sixties in such a way that huge numbers of Americans began to grow disillusioned with the democratic process.

A new factionalism arose; in the extreme the left turned to militant intolerance and revolutionary violence; the right to overreaction and vigilantism. Though the actual anti-democratic behavior was limited to a very few, they could claim sympathy in some degree from large segments of the population; the situation seemed to be evolving inexorably toward the classic confrontation of an anarchist minority and a majority demanding a return to tranquility at any price.

There was the increased mesmerization of the public by the electronic media. It eroded the traditional insulating time between events and their social impact, distorting perspective and judgment in the process. To some, anyone with long hair became a revolutionary; to others, the local traffic cop became an agent of evil oppressiveness.

And of course, the communications factor also meant that the distortions could begin to fulfill themselves as realities. People like Jerry Rubin and Abbie Hoffman could play for media impact and win large followings. Publicity from a single bombing could set off a rash of bomb threats and more actual bombings.

Beyond communications, other new technologies grew to have an even more direct relevance to the increased threat to democratic freedoms.

Recent advances in electronic miniaturization and other areas vastly increased the range and efficiency of eavesdropping devices for example.

And the uncomfortable implications of such increased capability were hardly diminished by the desire of some public officials to claim broad powers to use it. Attorney General John Mitchell felt free to declare unilaterally and rather formally last year at the opening of the Chicago conspiracy trial that Government agents had a right to eavesdrop on anybody the Attorney General decides is a threat to the national security, without any court review, and without having to disclose what has been overheard.

Computers have also had an impact. Last spring it was reported that the Administration had decided to organize and intensify its surveillance of radicals in the United States because of their increasingly violent activity. Then during the summer it was disclosed that various agencies of Government had created a computerized data bank to centralize the information the Government collects on citizens and make it available at the punch of a key.

Should an Administration decide that a Quebec-style crackdown on dissidents were in order, presumably, the computers would play a vital role.

Straining the Democratic Process

If all of these developments are disturbing in themselves, even more disturbing is the apparent symbiosis between them. If the new political tensions, the communications, and the information and surveillance technology obviously have not yet destroyed the democratic process, they are straining it.

This, indeed, is the nub of the repression issue in its modern sense. Because of the divisive politics and the instant communications, it's suggested with good reason, the moods, prejudices and emotions of men in power, beyond more rational words and carefully framed policies, have a heightened impact both on the public and on the bureaucracies of government. The new, readily abusable powers of information and surveillance make it all the easier for the moods and emotions to play an unhealthy role in practical terms.

Thus, some are tempted to blame the inflammatory anti-student rhetoric of Spiro Agnew for the shootings of students by National Guardsmen at Kent State University. And when New Left journalist Jack Newfield recently asked Ramsey Clark if there is a systematic Justice Department conspiracy against the Black Panthers, the former Attorney General replied:

"It's not so simple as a directive to get the

is true that the average policeman is only human; he may have trouble showing professional restraint because he has strong reasons for feeling contemptuous of the militants. But this is no excuse; rather, it is exactly the point.

Brewers Being Investigated for Job Bias Relating to Hiring Rules for U.S. Suppliers

11-4-70 Discrimination - Race

By BYRON E. CALAME
By a WALL STREET JOURNAL *Staff Reporter*

WASHINGTON — Federal bias fighters are quietly mounting a broad investigation of job discrimination in the brewing industry.

A top official of the Office of Federal Contract Compliance says it appears that minority-hiring regulations for Government contractors "are not being complied with" by several of the nation's largest brewers. If the brewers who do business with Uncle Sam—mostly beer sales to the military—don't respond to the regulations, this official vows, they could lose their right to bid on Federal contracts.

Several Federal officials say that some of the apparent job bias in the industry may be due to union referral-hall practices that discriminate against Negroes and other minority groups. If that proves to be the case, the Government would eventually take legal action against the unions, they warn.

A Federal survey of seven major brewers shows that blacks make up "pretty close to" 5% of their employes, one insider says. Officials say Negroes account for about 11.5% of the work force in the food industry, of which brewing is a part.

Seven Concerns Involved

The figures compiled in recent months cover Anheuser-Busch Inc. and Falstaff Brewing Corp., both of St. Louis; Pabst Brewing Co. and Jos. Schlitz Brewing Co., both of Milwaukee; Carling Brewing Co., a Cleveland-based subsidiary of Canadian Breweries Ltd.; C. Schmidt & Sons, Philadelphia, and Lucky Breweries Inc., San Francisco.

Preliminary and incomplete survey reports covering from a third to a half of the work force at each brewery shows the percentage of blacks is 2.2% at Anheuser-Busch and 2.5% at Falstaff. The figures for the other companies are Schmidt, 3.7%; Pabst, 6.4%; Schlitz, 7.3%; Lucky, 10.3%, and Carling, 14.3%.

Officials won't disclose the complete and final figures for each of the breweries, but they do confirm that the percentages of blacks in the total work force at most of the concerns are "roughly the same" as the proportions reflected in the partial reports. Information supplied to Federal job-bias agencies is considered confidential.

Requirements Explained

Minority-hiring regulations for Federal contractors, in essence, require that the percentage of Negroes in each individual plant should roughly approximate the proportion of blacks in the local community's population and labor force. In St. Louis, for example, 1967 Census Bureau estimates indicate Negroes make up 37% of the population; the figure is 34% in Cleveland and 14% in Milwaukee.

Where the number of Negro employes falls short of this requirement, contractors are required to take affirmative action by setting specific goals and timetables for achieving compliance.

In the brewery industry, much of the Federal officials' attention so far has focused on Anheuser-Busch, which employs about 10,500 persons at its various facilities around the country. Contract-compliance inspectors from the Agriculture Department, which is responsible for monitoring the affirmative action minority-hiring activities of all contractors supplying food products to the Government, visited the St. Louis-based concern last August. Officials quickly followed up with a check on the company's minority-hiring practices in September.

The Federal officials' interest in Anheuser-Busch coincides with a boycott of the company's products launched last summer by the Congress of Racial Equality in St. Louis. CORE leaders are demanding that the brewery hire 1,000 Negroes by next Oct. 1, replace retiring workers with blacks and submit quarterly reports to CORE on hiring. Part of CORE's strategy, St. Louis sources say, is to try to force Anheuser-Busch to deal more with it instead of the more conservative Urban League and National Association for the Advancement of Colored People.

Without mentioning Anheuser-Busch by name, Assistant Labor Secretary Arthur Fletcher indicated at a St. Louis news conference last month that data on more than half of that brewer's workers showed only 109 were Negroes. None of the available data on the brewing industry deals specifically with Spanish-surnamed Americans or other minority groups.

Federal officials unhappy with Anheuser-Busch's efforts to comply with minority hiring regulations imposed on most Federal contractors last February claim about 80% of the company's job applicants in the St. Louis area are Negroes. One Government insider asserts that applications from about 1,000 blacks are currently on file at Anheuser-Busch.

Actions Are Defended

August A. Busch Jr., president of Anheuser-Busch, contends that the company's "implementation of equal employment opportunities is unmatched in the industry . . . and what we are doing is right." The brewery boasts that "blacks are employed on every level of Anheuser-Busch's operations . . . from management positions on down."

A company-prepared "feature supplement" carried by three Negro newspapers in St. Louis last August claimed that as of July 1970 Negroes made up 19% of the workers in its breweries in Houston, Jacksonville, Fla., and Columbus, Ohio. The supplement asserted that 11% of all workers in the St. Louis brewery were blacks.

Federal officials, however, remain unimpressed. Says one: "This situation really stands out when you stop to consider that 50% to 60% of the people living around the brewery in the inner city (in St. Louis) are minorities."

Still, Federal bias fighters stress that part of the blame for the alleged job discrimination may wind up in the laps of certain unions representing brewing-industry workers. Major unions in this industry include the Teamsters and the Brewery Workers. Federal officials say that many of the union locals have labor contracts that require employers to hire through a referral hall.

"The union referral system—formally or informally—traditionally produces a lack of affirmative action," says one official.

The minority-hiring regulations spelled out last February require that an employer make a "good faith" effort to carry out an affirmative-action plan and achieve compliance. Records kept by employers to document their "good faith" efforts, Government officials concede, can later by used to pinpoint any job discrimination on the part of unions. If this evidence clearly reflects a "pattern or practice" of discrimination, the office of Federal Contract compliance can ask the Justice Department to file suit against the unions.

One Federal official asserts that the "biggest problems" in the brewing industry involve unionized plants. "The nonunion breweries are generally moving very aggressively," he says.

Reports filed with the Equal Employment Opportunity Commission earlier this year by union locals with referral hiring halls also reflect the brewing industry's problem, officials say. Three brewery workers union locals in St. Louis with 2,167 members reported that only nine members, or 0.4%, were Negroes. The comparable percentage for all the city's nonconstruction union locals that reported was 16.3%, and 6.5% of the members of building-trades locals with hiring halls were Negroes.

Standard was called off in May 1969, it was held up twice to give Indiana Standard time to "evaluate uncertainties arising from widely publicized events in Peru."

One of the events was the seizing the previous October of most of the assets of International Petroleum Co., a 99.9%-owned subsidiary of Standard Oil Co. (New Jersey). The Peruvian military junta said when seizing the company that it owed $690 million or more for alleged profiteering and tax evasion.

Robert F. Koenig, then Cerro's president, had told the company's annual meeting earlier in the year: "We've been approached, like any good-looking girl, by companies from A to Z."

The announcement also said Studebaker-Worthington would change its name to Studebaker Corp. Mr. Ruttenberg would be chairman and chief executive; Mr. Koenig, who is currently chairman of Cerro, would become chairman of the executive committee and vice chairman of the firm, and Mr. Murphy would be president and chief operating officer.

The combination of Cerro and Studebaker-Worthington would result in a company with annual sales of more than $1.3 billion, the statement concluded. Studebaker-Worthington had sales in 1969 of slightly more than $801 million. Cerro's sales were slightly more than $477 million.

The boards of both companies are scheduled to vote on the plan next week, according to Leslie T. Welsh, a Studebaker-Worthington senior vice president. Stockholders of both companies will vote early in 1971.

There are about 48,000 Studebaker-Worthington holders, according to Mr. Welsh, and about 23,000 Cerro holders.

GOP Anti-Crime Line Falls Short of Goal, Buoying the Democrats

Sen. Muskie Rated His Party's Front-Runner for '72; Role Of Agnew Is Question Mark

11-6-70

By NORMAN C. MILLER
Staff Reporter of THE WALL STREET JOURNAL

WASHINGTON—President Nixon's slashing law-and-order line in this fall's election campaign failed to overwhelm Democrats, giving them new confidence in their ability to exploit economic and other issues in the battle for the White House in 1972.

This conclusion is being reached here on the basis of the week's election results. Other important findings are emerging as well:

—Maine Sen. Edmund Muskie, winning widespread party praise for an election-eve TV talk scorning the Nixon campaign tactics, now returns to the Senate firmly established as the front-runner for the party's Presidential nomination. But the Democrats' feeling of enhanced Presidential prospects will intensify the scramble for the nomination by such other contenders as George McGovern of South Dakota, Harold Hughes of Iowa and Birch Bayh of Indiana.

—Vice President Agnew, having failed to purge most of his "radical-liberal" targets from the Senate, could be confronted with a campaign by GOP liberals and moderates to dump him from the 1972 ticket. The failure of the GOP's Agnew-powered drive to win Senate control leaves the party with only a slim chance of capturing the Senate in the next couple of elections, for far fewer Senate Democrats will face risky races in 1972 and 1974 than did this year.

—The Democrats' sweeping gains in gubernatorial contests greatly improve the party's prospects for maintaining control of the House all through the '70s. New Democratic governors will have a strong influence in redrawing Congressional districts as required next year by the new census in ways that favor Democrats. The party's House position, moreover, is bolstered by the modest gains it scored in Tuesday's House races.

An Issue Loses Its Punch

The early political portents emerging from the off-year elections may well change unpredictably over the next two years, of course. But for now, they will influence 1972 strategy-setting that will begin almost immediately in both parties.

While the Democrats draw encouragement from the elections, it would be too much to say that the results are a severe personal defeat for President Nixon. The GOP did gain a bit in the Senate; the outcome might well have been worse without the heavy Nixon-Agnew intervention. The small Democratic House gains hardly demonstrate a repudiation of the President. And Mr. Nixon wasn't personally involved in many of the state contests where Democrats elected governors.

Still, the results were disappointing for the President and probably will cause a change of his political tactics. The Nixon rhetoric on crime, campus unrest and other social disorders will likely be deemphasized. With a few notable exceptions, the Nixon-Agnew effort to depict Senate Democrats as soft on law and order simply didn't work politically. In several states, such as Illinois and California, liberal Senate Democratic candidates successfully deflected the law-and-order attack by stressing their own opposition to violence and beat their Republican foes on the basis of personality and by lambasting Nixon economic policies and other alleged short-comings.

To be sure, the Senate victories of such conservatives as James Buckley of New York, J. Glenn Beall of Maryland and William Brock of Tennessee, as well as Ronald Reagan's reelection as California governor, show that a tough law-and-order stance can sometimes work. But with many successful Democratic candidates talking a good law-and-order game themselves, the issue loses its big punch as the dominant Republican campaign theme.

Assessing Agnew's Role

Though the White House has high praise for Spiro Agnew's campaign efforts, at least a few liberal and moderate Republicans hope that in time the President may dramatically signal a move away from the right by dumping the Vice President. The Agnew-led purge of Republican Sen. Charles Goodell was deeply resented by GOP Senators friendly to the liberal New Yorker, and some of them would like nothing better than a reciprocal purge of Mr. Agnew.

But the VP may well be stronger than his party enemies. He can claim to have helped a few Republicans get elected to the Senate. Moreover, his personal appeal remains strong in the South, where GOP candidates generally fared poorly. And looking south, Mr. Nixon still must worry about staving off 1972 inroads into the region's conservative vote by George Wallace, reelected as governor of Alabama and readying himself for another third-party run for the Presidency.

While Mr. Nixon sorts out conflicting pressures from right and left, resurgent Democrats will be competing zestfully for the chance to oppose him. Sen. Muskie, strengthened by a big win in Maine, already has an imposing campaign organization at work. He will attempt to capitalize on his center position in the party, cementing support from labor and other old-line forces while attempting to gain more backing among liberal activists who suspect he's too cautious. Mr. Muskie will try to show that his low-key, let's-talk-sense style, as dis-

Please Turn to Page 25, Column 1

GOP Anti-Crime Line Falls Short Of Goal, Buoying the Democrats

Continued From First Page

played on election eve, makes him the best candidate to compete with Mr. Nixon for the votes of the silent majority.

But more controversial candidates can be expected to fight all the harder for a nomination that now seems worth a great deal. Sen. McGovern, hero of some antiwar activists, is expected to declare his candidacy, perhaps within a few months, and battle Mr. Muskie in 1972 primaries all the way from New Hampshire to California. Iowa's rugged-looking Sen. Hughes, who also has fans in peace groups, is putting together the nucleus of a campaign organization. Handsome Sen. Bayh of Indiana makes no secret of his interest, and some Democrats are encouraging equally handsome Sen. Walter Mondale of Minnesota to make a bid.

More distant possibilities also exist. The remote chance that New York Mayor John Lindsay will wind up on the Democratic ticket can't be ruled out, though defeats of Lindsay-backed candidates (Arthur Goldberg for governor, Mr. Goodell for the Senate) don't improve the prospects. Sen. Edward Kennedy's reelection victory in Massachusetts just might pull him back into Presidential contention, though he insists not. Hubert Humphrey's big Senate win in Minnesota, which helped pull in a Democratic governor, conceivably could rehabilitate him as a contender. Kennedy in-law Sargent Shriver, who took to the hustings for numerous Democrats, has worked himself into the speculation.

Young new Democratic victors seem certain to be talked up as Vice-Presidential possibilities. Among them are new Senators John Tunney of California and Adlai Stevenson III of Illinois, and Gov.-elect John Gilligan of Ohio.

Whoever winds up on the Democratic ticket, the crowded field of contenders will serve the important purpose of getting the party charged up for the Presidential campaign. Bright new faces and famous old names will likely be able to draw big crowds to party fund-raising affairs and thus fill the Democrats' depleted campaign coffers.

Some new Democratic Southern stars, such as Sen.-elect Lawton Chiles of Florida and Gov.-elect Dale Bumpers of Arkansas, may give the South new influence in the party. Their success in overcoming the Republicans' heralded "Southern strategy" is bound to make them attractions within the party.

More concretely, the Democratic net gain of nine to 12 governors (three are still undecided) puts the party in a good position to maintain its control of the U.S. House. With redistricting looming in almost every state, Republicans had hoped to win enough state legislatures and governorships to insure that many of their 1972 House candidates would have the advantage after lines were redrawn.

But in California, for example, Democrats regained control of both the state assembly and Senate and thus, despite Republican Reagan's reelection as governor, the district lines probably will be drawn in a way that would deny the GOP the six to 12 House seats it had hoped to gain from a Republican-controlled redistricting plan. Similarly, the loss of the Florida governorship to the Democrats will make it harder for the GOP to benefit from the three additional House seats the state is expected to gain because of population increases.

Population trends are such that the GOP still may benefit somewhat from redistricting; the general shift of population to the suburbs should help the Republicans. But the party controlling redistricting in a state can maximize its chances through artful gerrymandering, and thus the widespread GOP statehouse defeats cast a decade-long shadow over the party's chances of gaining control of the House for the first time since 1953.

Down the Middle

Election Likely to Move Democrats in Congress, Nixon Toward Center

Administration May Soften Tone; Some of Its Strong Critics in Senate Depart

A Noisy Lame-Duck Session

11-5-70 — 11-5-70

By ARLEN J. LARGE AND JOHN PIERSON
Staff Reporters of THE WALL STREET JOURNAL

WASHINGTON — This week's unexcited voice of the voter promises to send both President Nixon and the still-Democratic Congress rushing hell-bent back toward the political center.

Mr. Nixon gave Democrats a bad fright with his law-and-order onslaught. All fall they scrambled, American flags shining in their lapels, to show a stern face toward rioters. The experience is likely to have a lasting effect on "social issue" voting patterns during the 92nd Congress convening next January.

But despite scattered casualties among some prominent Nixon critics, the Administration's strategy really didn't work. Missed was the statistically promising chance to capture control of the Senate; William Fulbright will still be glowering at Vice President Agnew as chairman of the Senate Foreign Relations Committee. The House will be a bit more Democratic—and more than a bit more liberal—than it is now.

So Mr. Nixon will probably try a different approach when sketching his legislative and political reelection blueprint for 1972. The middle-income, middle-American voter remains the great prize, but the Nixon regime will offer him something more substantial than speeches against the "radical liberals."

Pushing Spending Higher

Sources throughout the Administration report an inventive list of ideas with blue-collar appeal is under consideration: A massive new health insurance plan; help for victims of crime; reforms in auto insurance; Federal standards tending to lift unemployment compensation; and possible changes to make Social Security payroll taxes look less burdensome.

The final package, however it is assembled, clearly will push Federal spending higher, risking fatter budget deficits and a new surge of inflation. But Mr. Nixon's political and economic advisers are saying this kind of stimulus is what's needed to push unemployment back down to a winning level by 1972; if prices threaten to take off again, the President can always start jawboning against inflationary increases and some orthodox Republican economists even think the 1972 stakes would justify some kind of wage-price controls.

Thus, the outlook is for a new, upbeat Nixon pitch to the middle electorate—a pitch quite different from the angry rhetoric of recent months. "This year," says a White House aide with a chuckle, "it's been throw the rascals out; in 1972 it'll be keep the rascals in."

The Lame-Duck Session

But any early Administration attempt to sound positive new themes could be drowned out by the din from the old 91st Congress, which begins its lame-duck session Nov. 16. Senate Democrats will be meeting in a spirit of revenge for the election defeats and insults they suffered, while GOP lawmakers blame Democratic bungling for being dragged back into session at all.

One of Tuesday's Senate victors, Democrat Adlai Stevenson III of Illinois, will immediately take the seat he won from Republican Ralph Smith, an appointee serving in the place of the late Everett Dirksen. The liberal Mr. Stevenson's presence could be offset for at least part of the lame-duck session by James Buckley, the new Conservative Party Senator from New York taking over the purged liberal Republican, Charles Goodell.

Post-election bitterness might make it more difficult for Administration loyalists and liberal Democrats to link up and save Mr. Nixon's welfare reform bill on the Senate floor. Another Administration project adversely affected by the campaign's rhetoric may be a $290 million appropriation for the supersonic transport; a sizable number of Senators seeking to dodge the "big spender" label promised to vote against it. And campaign arguments over spending priorities are sure to continue this month in the form of another attempt by Senate liberals to cut Pentagon appropriations.

Some Nixon Critics Depart

In January, though, Mr. Nixon's policies should have a bit more running room in a Senate that's somewhat more conservative. Republicans have made a net pickup of two and possibly three seats, depending on the outcome of a near draw in Indiana between Vance Hartke, the liberal Democratic incumbent, and conservative Republican Rep. Richard Roudebush. Even without the Indiana victory, the 45 sure Republican Senators will be the highest number in 12 years.

Gone from the Senate will be some strong Democratic critics of Mr. Nixon's foreign and domestic policies—Albert Gore of Tennessee, Joseph Tydings of Maryland, Stephen Young of Ohio (who's retiring)—replaced by Republicans who campaigned as Nixon supporters. The change is even somewhat greater than party labels would indicate: Though the GOP failed to elect its candidate in Texas, Democrat Lloyd Bentsen is more conservative than the outgoing Ralph Yarborough, and New York's Mr. Buckley is more attuned to Administration policies than was Sen. Goodell.

On the other hand, the election of Connecticut's Republican Lowell Weicker probably won't bring Mr. Nixon any more support in defense and foreign-policy fights than he got from defeated Thomas Dodd, a firmly anti-Communist Democrat. And near-automatic support on such questions from Republican Sen. Smith of Illinois and George Murphy of California will give way to near-automatic opposition from their liberal Democratic replacements, Mr. Stevenson and Rep. John Tunney.

In the House the Democrats showed a net gain of eight seats, maybe nine. But this masks the influx of perhaps a score of yeasty new Democrats who benefited from vacancies and primary victories, as well as Tuesday's balloting. Such activist newcomers as Father Robert Drinan of Massachusetts, Bella Abzug of New

Please Turn to Page 22, Column 3

Down the Middle: Election Is Seen Moving Congress, Nixon to Center

Continued From First Page

York and Ronald Dellums of California are likely to have little reverence for musty House traditions. The strengthened liberal wing among House Democrats should bring new pressure for changes in the seniority system and perhaps help the candidacy of Arizona's Morris Udall for Majority Leader against more establishmentarian rivals.

Within the total House membership, however, the coalition of Republicans and Southern Democrats is likely to remain a dominant force on what's come to be known as the "social issue"—matters dealing with crime, drugs, campus unrest and racial resentments. The untested new element next year will be Congressional response to the Administration's forthcoming economic policies.

Pressure to Accelerate

Although Mr. Nixon's first priority now would seem to be to get the economy moving again and cut the unemployment rolls by 1972, there is considerable disagreement within the Administration about how fast to go and what method to use.

One high official contends that Mr. Nixon's current policies, more or less unchanged, will succeed in achieving recovery on schedule. But an Administration economist foresees "tremendous pressure to greatly accelerate the economy." This official reasons that "to the extent the economy was an issue, it really hurt us, according to all reports." Despite some GOP gains, he says, "the political types will claim we would have done even better if it weren't for the economy."

Whether the President will allow the budget deficit to rise above the $10 billion to $20 billion already expected this fiscal year and next remains to be seen. While acknowledging that outlays could rise as much as $35 billion next year if the Government failed to adopt a tough budget policy, Deputy Director Caspar Weinberger of the Office of Management and Budget has vowed to find ways of paring even the so-called uncontrollable spending programs.

If economic stimulus is needed, Mr. Weinberger says, the Federal Reserve can pump out more money. But Administration pressure on the independent Reserve Board to loosen up on credit could make for rocky relations. At least some of the influential central bankers are in no mood to take the blame for any new inflationary flareup that might result.

Another question expected to revive is whether the White House should resort to verbal pressure against large wage and price increases. With expansionary forces likely to be unleashed to regain rapid growth, one official declares that this sort of Presidential leadership will be vital to prevent a dangerously rapid inflation. Another cautions that even last summer's mild finger-pointing at tire price increases "didn't win us any friends" in the industry. Nonetheless, the President's Council of Economic Advisers is expected to go considerably further in singling out excessive wage-price moves in its second Inflation Alert, due in mid-November.

Helping Crime Victims

Easing of inflation and a return to full employment could go far toward soothing the "middle-American" dissatisfaction that prevented Republicans from doing better in Tuesday's election. But there are strong indications that Mr. Nixon also plans to offer the "silent majority" some positive new programs starting in January. In some instances these will vie with similar Democratic proposals.

The program that comes up most often in conversation with White House aides is a health plan. The President has said he wants some sort of "family" health insurance plan to replace the Medicaid program for the needy. The Administration would like to present this as a supplement to the welfare reform measure now under consideration in Congress. But even if that bill is stymied or beaten in the coming lame-duck session, the family health insurance plan would be pushed on its own. Details of the plan are still being worked out, but it would likely cover more families than are eligible for welfare or medicaid.

With most of his anticrime proposals now on the law books, Mr. Nixon may shift the emphasis to helping the victims of crime. Under Justile Department study is a proposal that would grant tax exemptions to persons who invest in burglar alarms and another that would indemnify persons injured in robberies and other crimes. In addition, officials are considering a proposal that would make it a Federal crime to shoot a policeman.

In his State of the Union Message in January, Mr. Nixon is expected to make a strong pitch for the blue-collar vote. And the Administration is likely to refocus a number of existing programs toward lower-income whites and away from blacks. Model Cities program managers are now selecting several cities in which to experiment with community-wide rehabilitation; this would extend planning beyond the original target neighborhood (often black) to other neighborhoods in need of uplift (poor-white, blue-collar).

Debtors' Dilemma

Critics Charge Laws On Bankruptcies Fail To Protect Individuals

Creditors Often Continue Trying to Collect Funds Through Suits, Harassment

But Some Debtors at Fault

11-5-70

By RICHARD A. SHAFFER
Staff Reporter of THE WALL STREET JOURNAL

BOGALUSA, La. — Corbett Taylor "just laughed" when Home Finance Service filed suit against him to collect a $568 personal loan. "I had already gone bankrupt on that loan," he says, "and I was sure I was safe."

But Mr. Taylor didn't laugh long. By the time it was all over, Home Finance had collected not only the original $568 but also legal fees, court costs and interest, which brought the total to $939.

A fate similar to Mr. Taylor's appears likely for many of the 178,202 persons who filed for personal bankruptcy in the year ended last June 30. "The plain truth is that for many, many people today, bankruptcy just isn't solving their problems," says Royal E. Jackson, chief of the bankruptcy division of the administrative office of U.S. courts. One reason is that, contrary to common beliefs, creditors don't automatically mark off a debt once a person is bankrupt.

A Lack of Legal Protection?

Obviously, many who take the bankruptcy route are not innocent victims of misfortune and therefore deserving of creditors' solicitude. Indeed, some creditors say such innocent victims represent a smaller percentage of personal bankruptcies than ever before. Nevertheless, many authorities contend that, despite changes made last year by Congress to rectify the situation, bankruptcy laws still fall far short of their basic aim—to extricate persons hopelessly mired in debt and enable them to get a fresh start.

Consider Corbett Taylor's case:

In 1962 Mr. Taylor, then 30, went through Federal bankruptcy court after a fire destroyed his home and a seven-month strike at Crown Zellerbach cut off his $5,000-a-year income as a boiler-room helper. His debts mounted to $16,350.

But a year after Mr. Taylor was "discharged" from his debts—the term used in such cases—he was sued in Bogalusa city court by Home Finance, a subsidiary of CIT Financial Corp. Mr. Taylor says he didn't have the money for a lawyer, and when he failed to show up in court, the judge returned a default judgment against him. This was later upheld by an appeals court. Home Finance then initiated garnishment proceedings and collected the total of $939.

Mr. Taylor concludes that he "didn't gain much, if anything, by bankruptcy. My advice if you're planning to try it is—don't."

Bankruptcy is a Federal process governed by the Bankruptcy Act of 1898, which has been amended several times. A referee in bankruptcy presides over proceedings, which take place in the bankruptcy division of a Federal district court. Although he acts like a judge, the referee is only an employe of the court and is under the supervision of a Federal district judge.

Procedure for a Bankruptcy

To "take bankruptcy," a person files a schedule of assets and liabilities with the clerk of a district court. Creditors are given a period of time to file claims against the estate, and a [illegible] for the estate is usually appointed by [illegible] creditors.

Debtors' Dilemma: Bankruptcy Laws Are Failing to Protect Individuals

11-5-70

Continued From First Page

fees and would pay the debt in order to end hounding by the hospital.

The Congressionally approved changes, which take effect next year, require that creditors seeking to reassert debts after bankruptcy file such suits in Federal courts, not in state courts as has been the general rule. Theoretically, such a change would place all the information in the hands of a single court, thus lessening chances of an unfair decision. The new law also sets a time limit for the creditor to try to force the debtor to reassume an obligation.

Some skeptics, however, believe the changes may compound problems. One of these is Linn K. Twinem, chairman of the American Bar Association committee on consumer bankruptcy. He concedes that current bankruptcy laws are "in a rather sad state." But he doesn't believe the new law is the answer because he says, among other things, it will encourage court congestion.

At present, he contends, there is a "practical restraint" on creditors because they must face the "burden and expense of filing suit in state court" to try to force a consumer to reassume a debt after bankruptcy. Under the new law, creditors won't face additional costs in bankruptcy court.

Fraud Still Looms

Prof. Shuchman is also dubious. He notes that under the amended law, a discharge in bankruptcy still won't cover debts created by fraud. A finance company, for example, can still collect on its loan after bankruptcy by proving that it was misled by a false financial statement in extending the credit.

And that shouldn't be difficult in most cases, Mr. Shuchman says. As one test, he distributed typical loan-application forms to a class of law students. Each student was asked to list all his debts on it. Later, each form was discussed with the student, and Mr. Shuchman found that "there wasn't a single one of them that wasn't materially false within the meaning of the Bankruptcy Act."

In any case, the new law, passed after 15 years of unsuccessful efforts, promises to do little for another major problem of the bankrupt—continued out-of-court harassment by creditors who seek to collect a debt in spite of bankruptcy. After seven out of every 10 bankruptcies, creditors try to renew discharged debts, according to a report by Paul J. Garrity, a law professor at Boston University. Apparently they often succeed.

A Lake Charles, La., painter, John Daigle, alleges that after he went through bankruptcy, the manager for Port Finance Co. there got him to reassume a $4,000 debt by threatening him with criminal action. Mr. Daigle sued to get the reassumed debt thrown out. The manager denies the charges, saying Mr. Daigle reassumed the original $4,000 debt in order to get an additional $250 loan.

A jury decided in favor of Mr. Daigle, but an appeals court reversed the decision. The Louisiana Supreme Court refused to consider the case. Mr. Daigle's attorney says, however, he plans to take it to the U.S. Supreme Court.

Creditors Deny Harassment

Creditors unanimously deny that they harass bankrupts unfairly. Mr. Twinem, who besides his ABA committee assignment is a lawyer for Beneficial Finance Co., makes this comment:

"Where the bankrupt is honest but a victim of poor judgment or circumstances beyond his control, I have advised—and it has become the general policy of the organization to treat the bankrupt with courtesy and consideration. He should not be threatened, intimidated or coerced in any respect. At the same time it is recognized that many honest bankrupts want to pay their obligations. . . ."

Mr. Twinem adds, however, that the "dishonest bankrupt" is "to be dealt with [illegible]

bankruptcy experts say. About 80% of those who do are in debt trouble within five years "to the point of repossession and collection procedures," reports David R. Earl, author of a book, "The Bankruptians." He is also chairman of the state board that supervises collection agencies in Oregon. Within seven years, he says, 10% of bankrupts file for bankruptcy again and within 10 years the figure reaches 20%.

Many of the post-bankruptcy mishaps are blamed on such traits as financial ignorance or plain dishonesty. It's clear, however, that to certain merchants, the newly bankrupt is a special target who is free of debt and has a demonstrated appetite for credit.

"Regardless of your current bankruptcy and credit difficulties, we can deliver to you a like-new used car immediately," reads a solicitation letter from a Chicago car dealer.

Says a letter from a clothing and jewelry store that includes a $10 certificate for a down payment. "This is to tell you how sorry we were to hear about your bankruptcy."

The letter concludes: "Your account has been set up for $200 with no money down."

changes made last year, the new laws still fall far short of their basic aim—to extricate persons hopelessly mired in debt and enable them to get a fresh start.

Consider Corbett Taylor's case:

In 1962 Mr. Taylor, then 30, went through Federal bankruptcy court after a fire destroyed his home and a seven-month strike at Crown Zellerbach cut off his $5,000-a-year income as a boiler-room helper. His debts mounted to $16,350.

But a year after Mr. Taylor was "discharged" from his debts—the term used in such cases—he was sued in Bogalusa city court by Home Finance, a subsidiary of CIT Financial Corp. Mr. Taylor says he didn't have the money for a lawyer, and when he failed to show up in court, the judge returned a default judgment against him. This was later upheld by an appeals court. Home Finance then initiated garnishment proceedings and collected the total of $939.

Mr. Taylor concludes that he "didn't gain much, if anything, by bankruptcy. My advice if you're planning to try it is—don't."

Bankruptcy is a Federal process governed by the Bankruptcy Act of 1898, which has been amended several times. A referee in bankruptcy presides over proceedings, which take place in the bankruptcy division of a Federal district court. Although he acts like a judge, the referee is only an employe of the court and is under the supervision of a Federal district judge.

Procedure for a Bankruptcy

To "take bankruptcy," a person files a schedule of assets and liabilities with the clerk of a district court. Creditors are given a period of time to file claims against the estate, and a trustee for the estate is usually appointed by the court or, less often, elected by creditors. The court may then grant a discharge in bankruptcy—a piece of paper saying the person "hereby is discharged from all debts and claims" besides those "excepted from the operation of a discharge in bankruptcy." And there's the hitch for bankrupt persons. Exceptions include debts created by fraud, alimony, taxes and child support.

In most cases, the key word is "fraud," and the standard procedure has been for the creditor to file suit, generally in a state court. If the debtor shows up, the director will usually allege that the debt was incurred through fraud. The critics contend that the laws allow fraud to be legally proved far too easily.

Many bankrupt persons apparently aren't aware of the exceptions. In at least 20% of bankruptcy cases, creditors file suits to collect debts that the bankrupt individuals believe have been forgiven, according to a study by Prof. Philip Shuchman of the University of Connecticut law school. The practice is so common that in one New York State court not long ago post-bankruptcy lawsuits accounted for 24 of the 57 cases on the calendar.

Winning by Default

"These suits are quite successful as collection devices," says Prof. Shuchman, who found that creditors win seven cases out of 10. Many of these are won by default when the debtor, like Mr. Taylor, mistakenly thinks he is free of the obligation or when he lacks funds for a lawyer's fee.

In the Bogalusa city court, such lawsuits can be filed for as little as $10, and unless the bankrupt answers within five days, "we got ourselves a judgment, just like that, for $400 or $500 on the average," says attorney Don Arata, who represents Home Finance and seven other finance companies here.

Even when the bankrupt is sufficiently sophisticated to take steps to protect himself, it obviously requires persistence and some painful outlays of cash. Before a Congressional subcommittee, Mr. Jackson of the Federal courts' bankruptcy division told the story of an Ithaca, N.Y., man who went through bankruptcy several years ago. Among his debts was $800 owed to a hospital.

This is the version given by the man's lawyer:

After his debts, including the $800, were discharged in bankruptcy, the man moved to California and later to Chicago. In each area he found himself the defendant in a suit by the hospital to collect the money. He won both cases but at a total cost of $250 in fees for lawyers. The man again moved—this time to Cleveland—and again the hospital sued. When a Cleveland lawyer said he would charge $150 to represent the man, he gave up. He said he was through putting out money for lawyers'

Please Turn to Page 21, Column 1

In any case, the new law, passed after years of unsuccessful efforts, promises to do little for another major problem of the bankrupt—continued out-of-court harassment by creditors who seek to collect a debt in spite of bankruptcy. After seven out of every 10 bankruptcies, creditors try to renew discharged debts, according to a report by Paul J. Garrity, a law professor at Boston University. Apparently they often succeed.

A Lake Charles, La., painter, John Daigle, alleges that after he went through bankruptcy, the manager for Port Finance Co. there got him to reassume a $4,000 debt by threatening him with criminal action. Mr. Daigle sued to get the reassumed debt thrown out. The manager denies the charges, saying Mr. Daigle reassumed the original $4,000 debt in order to get an additional $250 loan.

A jury decided in favor of Mr. Daigle, but an appeals court reversed the decision. The Louisiana Supreme Court refused to consider the case. Mr. Daigle's attorney says, however, he plans to take it to the U.S. Supreme Court.

Creditors Deny Harassment

Creditors unanimously deny that they harass bankrupts unfairly. Mr. Twinem, who besides his ABA committee assignment is a lawyer for Beneficial Finance Co., makes this comment:

"Where the bankrupt is honest but a victim of poor judgment or circumstances beyond his control, I have advised—and it has become the general policy of the organization to treat the bankrupt with courtesy and consideration. He should not be threatened, intimidated or coerced in any respect. At the same time it is recognized that many honest bankrupts want to pay their obligations. . . ."

Mr. Twinem adds, however, that the "dishonest bankrupt" is "to be dealt with firmly and within the strict limitations of the bankruptcy law." Even then, he says, "coercive or abusive practices should never be employed."

Beneficial turned to a state court for help after the bankruptcy of James H. Lathrop, a New Orleans disc jockey and rock-music promoter also known as Herb Holiday. Beneficial had lent Mr. Lathrop $2,088 on the strength of a financial statement showing his total indebtedness at no more than $21,004.

When Mr. Lathrop filed for bankruptcy a month later, however, it developed that he owed about $61,000 and that on the same day he borrowed from Beneficial he made two other loans, from individuals, totaling $3,125. The court ordered Mr. Lathrop to pay Beneficial the $2,088 because his "intent was to deceive."

Criticism of the Current System

Critics of the current system maintain that even when there isn't coercion or harassment by creditors, bankruptcy procedures are ineffectual and badly conceived.

In nearly 75% of all consumer bankruptcies, there aren't any assets to distribute among creditors. Thus, the primary—some say the only—purpose of bankruptcy is to give the honest debtor "a new opportunity in life and a clear field for future effort," as the Supreme Court phrased it as long ago as 1934.

The system doesn't meet that goal, the critics charge. And one glaring omission, they say, is the limited amount of rehabilitation—guidance that would help prevent the bankrupt from again sinking into a financial morass.

A minimum of such guidance is provided under the so-called wage-earner plan, a special nonbankruptcy program under which the debtor pays all or part of his obligations through the court over a period of up to three years. Otherwise, "financial counseling is almost nonexistent" in bankruptcy, says Robert Dolphin Jr., author of a study in the field.

The need for such rehabilitation, the critics assert, is obvious. Most bankrupts, perhaps as many as 95%, subsequently use credit again,

Social-Issue Ballots Result in Mixed Bag; Clear Trend of the Times Doesn't Emerge

11-5-70

A WALL STREET JOURNAL *News Roundup*

Anyone trying to read the tenor of the times by the way voters balloted on scores of state referenda may just as well forget it.

In contrast to the dollars-and-cents bond issues, the vote on social propositions—lowering the voting age, selling liquor by the drink or having a state lottery of some sort, for example—stitched a patchwork quilt with no discernible trends.

Whether or not to lower the voting age was the most commonly asked question, appearing on ballots in 15 states. Five of them were approved. Maine and Nebraska dropped the limit to 20 years old from 21, Montana and Massachusetts lowered it to 19, and Alaska reduced its requirements to 18 years of age from 19. Meanwhile, Washington, Colorado, Wyoming, South Dakota, New Jersey and Minnesota declined to reduce it to 19 years of age, and Connecticut, Florida, Michigan and Hawaii voted not to let 18 year olds vote.

For all the interest in the issue, the voting may prove to be an exercise in futility. The Supreme Court has agreed to review the age issue on Constitutional grounds, and, if it decides on any specific age, its word will unquestionably be the final one.

Disparate Ecology Votes

Ecologists seemed to make headway in the East but lost ground in the West. Rhode Islanders approved an environmental "bill of rights," and Floridians agreed to increase the amount of money spent on clearing up sewage. The Florida move allows the state to pledge its support to bond issues for construction of waste treatment facilities.

Voters in the state of Washington, however, rejected a proposed five-cent deposit on a bottle or can of soft drink or beer. The purpose of the measure was to make the empties valuable and thus reduce littering.

In California, voters apparently rejected a proposal to unlock the state's constitutionally guarded highway construction funds for support of pollution studies and mass transit systems. With 97% of the vote counted, the proposal, backed by a wide range of conservation and ecology groups, was losing by a vote of 3,037,421 to 2,565,393.

This particular California vote has a more than local interest, because the state's powerful "freeway lobby," composed of construction interests, auto dealers, cement, and oil companies, believed passage of the proposal could lead to raids on similarly guarded construction funds in about 26 other states. The lobby argued that passage of the proposal would have the effect of raising taxes.

(While Californians rejected opening the highway funds, they approved bond issues of $310 million for antipollution and environment improvement projcts.)

Divided on Lottery

A state's right to have a lottery—on the ballot in two states—split right down the middle. Virginians approved it by a narrow margin, while Arizona voters apparently defeated theirs. With about half of Arizona's 865 precincts reporting, the vote is running at more than two to one against the measure.

The question of how openly liquor can be sold proved to be a hotly contested issue in several states. Texas voters cleared the way for "open saloons" for the first time since before prohibition. But Kansas voters not only retained their ban on liquor by the drink but may have signaled a tightening up on private clubs.

The Texas vote knocked out of the state constitution a provision banning "open saloons" and authorized the legislature to enact a mixed drink law, under local option.

In Kansas, a provision to authorize liquor by the drink led in early returns from urban areas, but the rural vote later reversed the trend. The Rev. Roy Hollomon, head of the powerful Kansas United Dry Forces, said he regarded the vote as a mandate "to tighten up private club laws." Kansas currently has privately owned retail liquor stores, and state laws allow a private club system where members pool their liquor and are served by the glass. Mr. Hollomon maintains the private club laws are loosely enforced.

Church-State Issue

Just what the separation of church and state means was interpreted differently by voters in different states. In Maryland balloters approved a constitutional amendment to allow voluntary prayers in public schools. In Nebraska, a proposal allowing state aid to be granted to private and parochial schools was rejected. In Michigan, where legislative bodies moved to provide public funds to private and parochial schools, voters supported a measure to ban payments of parochial schoolteacher salaries.

The state constitution itself was on the ballot in three statewide elections. In Virginia, the first constitutional revision in 42 years was put to vote and passed by a large margin. But in Arkansas and Indiana new constitutions were turned down.

Among issues on the ballot in various states:

—Washington voters approved a measure to legalize abortions performed by licensed physicians in accredited hospitals or other medical facilities.

—In Massachuetts a majority of voters indicated they preferred President Nixon's policy of planned withdrawal over either an immediate pullout or no pullout of troops at all.

—A heavy vote from the upstate portion of New York overpowered New York City's support of a measure for low-rent housing.

—South Dakota and Washington balloters turned down proposals for a state income tax.

—Residents of Warren, Mich., a community near Detroit, voted to reject Federal funds for urban renewal. Citizens apparently believed Federal funds would allow the Federal Government to interfere in local affairs and customs.

And in Berkeley, Calif., homosexuals affiliated with the Gay Liberation Front held their own election, voting down a proposal to take over a town near the Nevada border. The proposal, recently publicized and bitterly opposed by the town's residents, had been advanced as an avenue of escape from discrimination and harassment. In the election, the opposition group that won the ballot denounced it as "sexist," "racist," and "impractical," according to United Press International.

Handicraft Hazards: Pottery Made at Home Can Be Very Harmful

Toxic Metals Used in Glazes Prove Lethal in Some Cases; A Radioactive Coffee Cup

11/11/71

By BARRY NEWMAN
Staff Reporter of THE WALL STREET JOURNAL

Remember that ~~adorable clay pitcher~~ your neighbor's kid made for you at summer camp? It's perfect for keeping orange juice ice cold in the refrigerator. And once in a while you store stewed tomatoes or sauerkraut in it.

Here's a way to get even more enjoyment from that product of creative little hands: Get rid of it.

For unless you know precisely how that piece of crockery was made or have gone to the trouble and expense of getting it analyzed by a laboratory, the toxic metals in the glaze could be lethal. Glazes are the glass-like coatings fused at high heat to earthenware surfaces. They typically contain significant amounts of lead or other heavy metals that add color and speed the fusion process.

Commercial manufacturers of pottery tightly control the fusing time, thickness of the glaze and a number of other factors. Moreover, they constantly monitor their products and submit them to outside testing laboratories to make sure dangerous levels of lead aren't being released.

The problem is that the number of amateur potters is growing rapidly. The American Crafts Council, which calls ceramics the most popular craft, lists 462 recognized pottery courses being taught around the U.S. That's twice the number of five years ago. And that only hints at the number of others who teach pottery on an informal basis and those who teach themselves.

Anyone can make pottery at home for an investment of $200 or less. Finished products can be sold without licensing and inspection. There isn't any system for certifying ceramics teachers, and there aren't any requirements that they be trained in the lethal possibilities of toxic glazes.

Several Deaths

Over the past three years, there have been at least a half dozen deaths in the U.S. and Canada from pottery poisoning. All but one resulted from imported items or those made by independent craftsmen. (In the one attributable to a commercially manufactured product, a 17-month-old Philadelphia child died earlier this year from lead in a crock made by Metlox Potteries of Manhattan Beach, Calif. The Food and Drug Administration recalled two of the company's lines found to be unsafe. Metlox cooperated fully in the recall.)

After a two-year-old Montreal boy died recently from lead in a handmade pitcher bought in Nova Scotia, a group of doctors tested 264 pottery pieces bought at U.S. and Canadian handicraft and department stores. They reported in the New England Journal of Medicine that half "released sufficient lead to make them unfit for culinary use." Thirty of the 40 handcrafted dishes tested were "potentially" poisonous. Of 147 glazes "in use by schools, clubs, studios and potters," the doctors found 111 unsafe.

Efforts to detect the offending items have been limited so far. The FDA has detained 602 shipments of foreign pottery in the last two years and in July began spot checks of domestic manufacturers. But the agency says it can do little to monitor independent craftsmen. "It's too big a problem," says Benjamin Krinitz, head of the FDA's New York food section.

State and local governments agree and contend there are other, more pressing problems. "Nobody's come in sick, and the law says we don't have to test the stuff until there's a case," says a spokesman for New York City's Health Department. In California, a bill barring sale of pottery that doesn't meet certain standards was introduced this year. But it died in the Senate finance committee.

Another problem is that there isn't any simple way to test for lead in pottery. Field kits are only in the development stage and haven't been widely distributed. Tests in private laboratories cost up to $20 for each item.

In an effort to reach independent craftsmen, the Lead Industries Association, a trade group, recently issued a 10-page booklet warning beginning potters to refrain "altogether from designing and firing cups, mugs or other food and beverage utensils." The association says a program is being developed for labeling of safe pottery sold in stores. And it says it is asking manufacturers of pre-mix hobby glazes to mark their products if they are safe for use with foods.

But it isn't known how effective such voluntary measures will be. For one thing, many glaze makers seem unwilling to put warning labels on their products. Jack D. Wolfe, a Brooklyn supplier, says "I've been selling glazes for 30 years and not one person has complained or gotten sick."

Meanwhile, a growing number of potters are becoming concerned about their products. Camille Billops, who lives and works in a big Manhattan loft, discovered only a year ago that her handiwork might be hazardous. Like most potters who go to established schools, she was trained to make "stoneware" in a high temperature kiln. But when she set up her own

Please Turn to Page 31, Column 4

Handicraft Hazards: Pottery Made at Home Can Be Very Harmful

Continued From First Page

shop, she bought a relatively inexpensive—and potentially dangerous—low temperature kiln.

It wasn't until she had given away several pieces that she learned certain glazes weren't safe when fired at low temperatures. A laboratory confirmed that her pots were poisonous. "I called everyone and told them to break those pots," she recalls. "They looked great on old oak tables, but I wasn't going to wait until somebody died before I did anything about it." Mrs. Billops has quit using lead glazes and inscribes "No Pb" on the back of her crockery. (Pb is the symbol for lead.)

Taking out the lead, however, may be even more dangerous than leaving it in. The Lead Industries Association says its research hasn't found any element that will "impart all of the desirable properties to a glaze that lead will—and do so with reasonable economy and complete safety when properly handled."

After she stopped using lead, Mrs. Billops took to rummaging among the piles of plastic boxes filled with red, blue and green powders in the corner of her loft, searching for a substitute. Much of what she found—compounds of chrome, cadmium, sodium, uranium and other metals—was listed among the most deadly elements in a weighty book called "Dangerous Properties of Industrial Metals."

She took one cup glazed with uranium oxide to the Atomic Energy Commission. It turned out to be radioactive. "They told me it was safe," says says, "unless it's ingested." Uranium oxide isn't on Mrs. Billops' shelves any more.

But if lead and uranium aren't safe, what is? Mrs. Billops and other potters are confused. Most research done so far on glazes has concentrated on mass-produced dinnerware. The Lead Industries Association admits "we don't have all the answers" about low temperature lead glazes used by amateurs. "As for low temperature leadless glazes," the trade group says, "it is still unknown whether these are safe for food contact surfaces."

Affirmation From the Left

The Bookshelf

Somehow the tricks of the media, or perhaps the tricks of the mind, leave the impression that the past few years have been absolutely dominated by the torrent of books and articles celebrating the new radicalism. It comes as something of a surprise to discover how much absolutely withering criticism the radicals have also suffered.

More than 20 critical articles have now been collected and put into a unified framework in "The Radical Left: The Abuse of Discontent," (Houghton Mifflin. 366 pages. $8.95) edited by William P. Gerberding and Duane E. Smith, members of the political science department at the University of California at Los Angeles. Few collections of articles could show a higher average quality, and the cumulative effect is a singularly incisive critique of both the ideas and the personality of the New Left.

There is, for example, Renata Adler's New Yorker article reporting on a convention of radicals at the Palmer House in Chicago—a delightfully understated piece showing the leftists at their most jejune. At a different level, there is Nathan Glazer's "America's Race Paradox," one of the best treatments of the racial problem's central irony—that things are getting subjectively worse as they get objectively better.

In general, the articles are grouped into five sections. One treats the tactics of the New Left, with their intolerant and anti-democratic implications. One examines university revolt in particular. Another treats race and guilt, and one defends certain particulars of our political system—interest politics, Presidential nominating conventions, etc.—typically attacked with special fervor by radicals.

The remaining section, "Intellectuals and Politics," is of particular interest for the instinct it shows. The editors shrewdly understand what many people have started to sense barely if at all: That the rise of often sophomoric radicalism in the late 60s is intimately related with the intellectual history of the decade. Radicalism became fashionable in the face of the kind of devastating criticism offered in this volume in large part because it served some special inner needs of the intellectual class.

The articles in this section explore such questions as the tension and ambivalence always found between the intellectual and a society's power-holders, and the dangers of the intellectual's inevitable proclivity toward utopian political schemes. Since the contributors are themselves indisputable intellectuals, they can make such criticisms both with immeasurably more grace and far deeper understanding than Spiro Agnew does.

"The Radical Left" also serves to show again that there is a swing to the right, a backlash even, at the intellectual as well as political level. Most contributors to this volume are pragmatic liberals; they may not be representative of the breed, but they do represent the current position of some of a certain type of distinguished liberal. Yet listen to the editors summarize their purposes:

"1. to argue that traditional democratic politics have served this nation rather well on balance in terms of such criteria as freedom, justice, material well-being and playing an honorable and effective role in international affairs;

"2. to argue the legitimacy and perhaps the superiority of a political system where interests tend to play as vital a role in politics as ideas (or ideals);

"3. to suggest that proposals for change should be carefully examined lest their unanticipated consequences turn out to be worse than the problems allegedly being resolved;

"4. to point out that the means employed by many of the new radicals are in violation of traditional libertarian norms and are a threat to the survival of those norms both by themselves and by virtue of the reactions they produce from hostile and at least potentially anti-democratic forces on the Right;

"5. to suggest that an exclusive and fervent preoccupation with idealistic politics and objectives is by itself no substitute for—and carried to extremes, is sometimes incompatible with—such positive political qualities as tolerance for dissent and disagreement and appreciation of the uses of diversity and prudential judgment; and to suggest, moreover, that such single-mindedness sometimes carries within it the seeds of a dogmatic, crusading style of politics that seeks to rule or ruin;

"6. to suggest that certain styles of politics, especially those with a revolutionary or utopian quality, are often more the consequence of their advocates' psychological disorders than they are an appropriate response to the shortcomings of the political system."

It would be hard to imagine a more concise statement of the conservative creed as it applies to the current state of affairs, and one of the shortcomings of this book is its failure to give credit where credit is due. One need not expect the editors to prostrate themselves before ideology of any sort, but there could be at least a grudging recognition of the debt this book owes to conservative thinking.

Instead, conservatives are treated with the usual cheapshots, such as the balancing of the irresponsible left with the responsible right. An accounting of the "Socratic gadfly" in American society runs "Russell Kirk and Tom Hayden, James Kilpatrick and Stokely Carmichael." Who would write, say, Arthur Schlesinger Jr. and Robert Welch, Tom Wicker and Billy Hargis?

Beyond that, other criticisms would be minor. Mr. Gerberding's arguments for blacks accepting the system leans rather too heavily, perhaps, on the notion that the numerical balance gives them no choice no matter how racist Americans are. It's also worthwhile to stress that latent strains of racism are balanced by considerable reservoirs of good will.

The book might have profited from a section on the Vietnam war, arguing as Mr. Gerberding does, that the mistakes there are made from honorable motives. Possibly the articles developing this point are not available, certainly we have only the barest start toward a realistic understanding of the precise motives, or for that matter the precise mistakes.

Such faults are easily forgivable, though, in so remarkable a collection of writings. At its roots "The Radical Left: The Abuse of Discontent" is an affirmation of American society, which is precisely the need of the day. And the quality of mind its contributors display suggests that affirmation after all will hold the day against even the recent torrent of flighty abuse.

—ROBERT L. BARTLEY

Notable & Quotable

Malcolm Muir Jr., editor-in-chief of Atlas, writing in the October issue of the magazine:

In the West at least, the traditional image of America as a blundering, violent nation of well-intentioned ruffians is fast dying out—and being replaced by what? Perhaps by no image at all. The tumult of the Sixties convinced many Western observers that America, despite all the idealistic brouhaha, is just another nation of people—as subject to weakness and folly as any group of human beings. Perhaps now, at the beginning of the Seventies, this altered vision of America will clear the way for a more serious study of how the nation deals with its youth, its technology, its minorities, and its environment. For, as a French journalist friend of ours said, "You're us. A few years ahead, a lot richer, but you're just us."

DEVELOPING BLACK ENTREPRENEURSHIP IN THE PULP AND PAPER AND SAWMILL INDUSTRIES

prepared for

The Division of Legal Information and Community Service
NAACP LEGAL DEFENSE AND EDUCATIONAL FUND, Inc.

by

Thomas Karter

INTRODUCTION

This report on developing black entrepreneurship in the pulp and paper and related wood industries has been prepared at the request of the NAACP Legal Defense Fund. (See the attached June 17, 1968, letter from Mr. Allen Black, Jr., Regional Director.)

Initially, the intention was to study methods of developing more employment and higher wages for black entrepreneurs producing pulpwood for sale to pulp and paper mills.

During preliminary discussions with officials of the U.S. Forest Service, the U.S. Department of Labor and the American Pulpwood Association, these agencies expressed their concern and the concern of the pulp industry of the need to expand the number of woodsworkers in the South. They stated that low wages, poor working conditions and irregular employment restricted the entry of workers into logging operations. These poor employment conditions were traced largely to the present marketing mechanism. Individual jobbers, usually with fixed production quotas from pulp mills, bargain for the production of many small producers, who may work alone or who may employ several woodsworkers. It is to the jobber's advantage to have an oversupply of producers and production. While many producers and woodsworkers are black, I met no one who knew of a black jobber.

why no black jobbers?

It was evident that black entrepreneurs would have to move into the marketing mechanism if employment was to be stabliized and income improved for black woodsworkers and black producers. The most effective way to exert some control over the marketing mechanism is to control the end product and work back into the woods.

Consequently, after a discussion with Mr. Black, the scope of the report was expanded to consider sawmill operations as well as

pulp mill operations. Such a sawmill operation could produce sawtimber for woods products industries, such as furniture, housing, agricultural needs, etc., and produce chips for the pulp industry. In addition, a sawmill corporation could negotiate directly with pulp mills for quotas for pulp production, and could also organize the logging and marketing operations. Independently of the pulp industry, the sawmill corporation could also organize logging and marketing operations for sawtimber, thus developing a mechanism for cutting and using all types of wood, not only pulpwood. Eventually, the sawmill operation could organize and operate a number of woods products industries, or stimulate other black organizations to produce and market furniture, lumber, etc.

The sawmill operation is more feasible than a pulp mill in gaining some control over the production and marketing of timber, as the investment needed for a sawmill ranges from $100,000 for a small operation to several millions for a large one, while the investment needed for pulp mills usually starts at $30 million and can go to $75 million and above.

investment to be a sawmill much much smaller!

The scope of this report therefore covers the development of black entrepreneurship in connection with the pulp and paper and sawmill industries, and suggests how black entrepreneurship employment and earnings can be expanded in this industry.

PROJECT FEASIBILITY

From my discussions, observations and analyses, I judge that it is quite feasible to expand black entrepreneurship and black employment in connection with the pulp and paper industries. The U.S. Forest Service forecasts point to a pulpwood production increase nationally from the 1966 level of 54.5 million cords to 118.7 million in 1985, some 2.2 times greater.1/ With more than 200 million acres of forest-land, the South offers unlimited opportunity for future timber growth. In 1966, the South accounted for about 33 million cords or 61 per cent of the nation's total. It is expected that the South will have to supply approximately 77 million cords by 1985, 2½ times as much as 1966, or 65 per cent of the estimated national total.

The U.S. Forest Service expects a major expansion in the potential markets for lumber, plywood and other timber products due to an expected increase in housing starts. During the recent four years, total lumber production nationally, as well as in the South, has been relatively stable. In 1967, national production of lumber totalled 35.9 billion board feet, of which the South produced 10.5 billion board feet, compared with 34.7 and 10.2 respectively in 1963. During this same period, the number of

---

1/ The Demand and Price Situation for Forest Products, 1967, Miscellaneous Publication No. 1066, U.S. Department of Agriculture.

housing starts dropped by about one-fourth. Consequently renewed housing activity is likely to have a substantial impact on lumber production.

Furthermore, there is likely to be a considerable expansion in the production of southern pine plywood, which means that a higher proportion of the nation's lumber production is likely to come form the South. For example, in his recent address to the Georgia Forestry Association, Mr. V. J. Sutton, U.S. President of Bowaters Company, pointed out that the production of Southern pine plywood (only 80 million square feet a year in 1964) is expected to be four billion square feet annually by 1970. If the expected increase in population and housing develops, there will be a corresponding need for more lumber--and more saw-logs. This need for increased timber production indicates a parallel need for increased woodworkers, yet the industry is facing a critical manpower shortage. In my discussions with the American Pulpwood Association, the Employment Service and the Forest Service, it was apparent that they are trying to come to grips with the problem, and they expressed a sincere interest in training programs in this area.

The critical manpower shortage of woodsworkers exists primarily because of low wages, poor working conditions, and the lack of steady employment. While training of woodsworkers is important, wages and working conditions must be improved, as discussed below. In addition to training and employment of woodsworkers, opportunities exist for increased black ownership in the trucking and marketing of timber. Indeed, unless there is control of the marketing of timber, it will be difficult to expand "profitable" black ownership, or to substantially increase wages and employment for black woodsworkers.

As explained above, it is quite feasible to control the production and marketing of sawtimber by operating a sawmill, and using the sawmill as the base from which to immediately extend the operation into the woods for cutting, shipping and marketing timber--both for pulp mills and sawmills--and eventually expand into numerous wood products industries. ?

Consequently, I recommend that the NAACP Legal Defense Fund begin a woods program with a medium sized sawmill that would require about $750,000 for new plant, equipment and operating capital. According to the Department of Commerce, the expected net profit for such a sawmill by the third year of operation would approach $150,000. A specific feasibility study would provide firm estimates of capital requirements and profit potential, as indicated below. what size tract would be needed?

Why Build a New Plant Instead of Buying an Old One: The black man in the South is faced with the problem of not owning industries, and he has two alternatives for acquiring ownership. He can either build a new plant or he can often buy an existing plant in the area. These "hand-me-down" plants are certainly cheaper and may utilize

more labor than new plants, but within the near future new plants will be constructed which are likely to force the older plants into bankruptcy, and add the workers to the unemployed roles.

Furthermore, according to the U.S. Forest Service, the competitive situation of the Southern lumber industry has improved in recent years with the closing of small sawmills, which were high cost mills due to high unit labor costs. Though unit labor costs are high, the average earnings for Southern workers are the lowest in the nation. Consequently, there are many small and old sawmill plants that are for sale, but these would be as noncompetitive nationally or locally in black ownership as they were in white ownership.

I suggest, therefore, that the black corporation avoid the purchase of an old plant (which may seem like a bargain), and invest immediately in new plant and equipment. In this way, the black corporation can compete (and beat) white corporations operating older plants and thus the black corporation need not depend entirely on the "soul brother" market for its sales. Furthermore, it will be easier for a black corporation operating a new efficient plant to obtain additional capital to build new sawmills in other areas. In this way, black employment will be increased, and such employees working in the most automated sawmills will be able to earn substantially more than their brothers working in old sawmills. Also such an automated sawmill operation will be in a good financial position to develop integrated wood products industries, such as furniture factories, lumber yards, etc.

Comparison with Germany after World War II: The German people owned very few factories at the end of W.W.II, as their factories were largely destroyed by the Allies during the war or dismantled shortly thereafter. Consequently, when Germany industrialized she had no choice but to construct new factories with the most modern equipment. Today, German industries are among the most advanced in Europe.

The Black people down south should consider the German experience and begin their ownership of industry with the most modern plants and equipment and not invest in "hand-me-down" plants and equipment.

FUNCTIONS OF A BLACK SAWMILL CORPORATION

In addition to operating a sawmill, the black corporation owning the sawmill plant would also:

1. Negotiate with pulp mills and other users to supply them with pulpwood or sawtimber. The markets for the sale of pulpwood or sawtimber (for housing, furniture, agricultural uses, etc.) must be developed before final decisions are made to construct a sawmill. Initial contacts with pulp mills should be made at

top company levels.

2. Bid on stumpage rights on publicly-owned land and on private land. (Stumpage rights means the right to cut and market trees on someone else's land.) Negotiation should begin at top company levels to obtain stumpage rights on large tracts of land owned by pulp companies.

3. Operate a woods program by hiring and supervising woodsworkers and truckers to transport the timber. Such a woods program should be geared to large acreage on public or private land that is suitable for mechanized harvesting methods.

4. Organize the marketing mechanism from the woods to the sawmill and pulp mill by hiring jobbers. These jobbers would negotiate with cooperatives and black producers for their timber production, which would supplement the direct production by sawmill employees described above in 3, and they would arrange for the steady flow of timber to sawmills and pulp mills according to quotas negotiated with pulp mills and sawmills.

5. Assist black producers and cooperatives in arranging for loans, training and technical assistance to expand their production and reduce their costs, and thus enable them to provide more stable employment with higher wages for woodsworkers.

6. Organize and stimulate training programs for woodsworkers.

7. Develop wood products industries that would be integrated into the sawmill operation.

8. Expand this integrated woods to end use operation into other areas in the South.

EMPLOYMENT POSSIBILITIES

According to the U.S. Department of Commerce, a medium-sized sawmill operation, requiring an investment of some $750,000 and capable of processing 10 million board feet a year, could employ the following:

20 men full-time in directly related jobs in the sawmill

35 men full-time in logging and cutting

35 men full-time in indirectly related jobs, i.e. selling, administrative and management, trucking and hauling

Job descriptions for production personnel are attached.

One of the key employees of the sawmill operation is a jobber to be employed directly by the sawmill corporation. His responsibilities involve bidding for stumpage rights on public and

privately-owned land, locating markets and arranging sales with pulp and timber users. He would also coordinate the timber production of cooperatives and black producers with the sawmill operation and arrange for the purchase of all their timber by the sawmill.

The sawmill corporation could also establish a multi-county or statewide mechanism to train black farmers and farm workers on chainsaw operations, and assist them in marketing their production to pulp mills and sawmills. While the sawmill operation would buy for its own use from local producers, the statewide mechanism would assist other black producers to produce more at less cost, and to obtain a better price for their production. At least 1,000 small black producers and workers in Mississippi could be served through this training, technical assistance and jobbing mechanism for both pulp and sawtimber operations.

Caution: The training of additional woodsworkers should not precede the development of this technical assistance-jobbing mechanism. Otherwise there is likely to be little benefit to the workers as you may flood a local market with trained people and chainsaw equipment.

EARNINGS

In order to ensure regular employment and high wages for woodsworkers, the jobbing end of the logging operation should be strictly controlled by the corporation, by having the jobber and woodsworkers employed directly by the corporation. Although woodsworkers employed directly by small producers in Mississippi earn as little as $60 per week, when they are lucky enough to be employed, woodsworkers working directly for a company are making more than $150 a week on a piece-rate basis in many parts of the country, according to the U.S. Department of Labor. The difference, of course, is that company operations use the most efficient methods and machinery, and are tied in directly to a consumer, which minimizes loss of time in the woods operations.

Small producers who usually employ 3-5 men, or who buy the production of a small number of chainsaw operators, earn about $10,000 a year, according to the Mississippi Forest Service.

Production workers in Mississippi sawmills and furniture plants earn about $75 a week, while production workers in papermills earn about $125 per week, according to the U.S. Department of Labor.

POSSIBLE SITE

The site for a sawmill operation (which would also be equipped to produce chips for pulp mills) should be located close to a National Forest in order to assure a continuous supply of timber. From this site, the corporation could bid for stumpage rights on private land, but the corporation would not be dependent solely

upon such private sources for its timber supply.

There are six National Forests in Mississippi which are listed in the table below which also shows the estimated amount of timber to be cut in FY 1969.

The Forest Service in Washington, D. C. suggested the Holly Springs National Forest as a possible site for a training center. The Holly Springs National Forest is in the north-central part of the state, and close to the Mississippi Delta area which has the greatest number of unemployed and underemployed farmworkers in Mississippi.

ESTIMATED ANNUAL ALLOWABLE CUT IN FY 1969
IN NATIONAL FORESTS IN MISSISSIPPI

National Forest	Sawtimber (millions of board feet)		Pulpwood (thousands of cords)	
	Pine	Hardwood	Pine	Hardwood
Holly Springs	5.0	2.4	6.4	4.8
Delta	-	6.5	-	-
Tombigbee	3.5	.6	1.9	-
Homochitto	21.9	1.2	11.0	-
Bienville	15.8	4.9	12.0	15.0
De Soto	31.0	3.9	43.1	.6
Total	77.2	19.5	74.4	20.4

Source: Data supplied by the U.S. Department of Agriculture, Forest Service, National Forests in Mississippi.

Another site to be considered is the De Soto National Forest which is in the south-eastern part of Mississippi, and which has the greatest amount of timber to be cut of all the National Forests in Mississippi. De Soto borders the western end of the black belt of Alabama which means access to a large number of unemployed and underemployed farm workers.

Before a specific site is selected, there will have to be a feasibility study to:

1. Determine the end use of the timber. For example, the sawtimber will have to be evaluated to determine whether it is best suited for the furniture, housing or the agricultural industry and the specific type of use within each industry.

2. Determine whether a market exists in the area for such wood products, and, if not, whether a wood products industry or other industries can be feasibly started in the same general area as the sawmill.

3. Determine the investment needed for plant and equipment costs and operating capital, and the potential profit from such an operation.

A number of firms are available to conduct such a feasibility study, and also to assist in plant design, plant construction, plant start-up and the training of staff. Information is attached on one such firm, Stone and Webster.

FINANCIAL AND TECHNICAL SUPPORT
FOR PLANT AND EQUIPMENT

The sawmill operation, by locating near the Holly Springs or De Soto National Forests (EDA-designated areas), will be eligible for an EDA loan up to 65% of total investment. A list of EDA designated counties and information on EDA loans are attached. The balance of the investment funds might be obtained from the Ford Foundation which is interested in investing capital in Southern economic development operations, or from the OEO Research and Demonstration Division in Washington, D. C.

In addition to EDA, the Small Business Administration is interested in assisting Negro-owned business enterprises, and is a good source for loans for wood products industries spinning off from the sawmill operation, and for wholesale and retail outlets such as furniture stores, which can be expected to sell final products.

Rural cooperatives are eligible for Farmers Home Administration (FHA) loans which would cover equipment, marketing and related costs (30 years at 4 1/8%). Small producers are also eligible for FHA loans for chainsaws, trucks, etc. (See attached information.)

FINANCIAL AND TECHNICAL SUPPORT FOR
TRAINING PROGRAMS

The sawmill corporation can operate training programs itself as well as stimulate the development of training programs operated by other agencies, and thus have a pool of trained people to select from when the corporation is ready to begin production.

As an employer of woodsworkers or sawmill operators, the corporation is eligible to receive on-the-job training funds to reimburse the corporation for the cost of training new employees. The corporation would pay wages, and the U.S. Department of Labor

BEST COPY AVAILABLE

could finance the cost of trainers, materials, and related training costs. On-the-job training programs are administered through the Bureau of Work Training Programs which has a regional office in Atlanta which covers Mississippi and other Southern states. However, OJT funds are not readily available due to Federal budget cutbacks.

Also, as an employer, the sawmill corporation could request trained employees from the state employment service agencies, and, if not available, the E.S. could establish MDTA or other training programs to fulfill the employment needs of the corporation. Such information should also be forwarded from the corporation directly to the U.S. Department of Labor in Washington, to have the Department assist in negotiating training programs at the state level.

The Economic Development Administration also has funds for training programs. However, these programs are administered by the employment service.

In view of timing problems, the shortage of funds for manpower programs, and the attitude of the governor of Mississippi, the state agencies are not likely to meet the needs of a black corporation. Consequently, it probably will be necessary for the corporation to plan to conduct most of its training and to receive funds directly from the U.S. Department of Labor. I am discussing with Labor Department officials the possibility of obtaining funds for an experimental training program funded directly out of Washington.

OEO is another source of training money. There are several education-training programs in the Mississippi Delta funded by OEO for farm workers. I've discussed with the Director of the Office of Special Field programs in OEO the possibility of converting some of the existing programs to train woodsworkers, sawmill operators, etc., or to contract with the NAACP Legal Defense Fund for such training. OEO will be in a better position to negotiate such possibilities after they receive their appropriation for FY 1969. The OEO farm worker programs need not be funded through local community action agencies, nor are they subject to the Governor's veto.

I am attaching a copy of an approved MDTA program to train loggers in New Hampshire, and a proposed Mississippi Forestry MDTA project that was not approved. Public agency personnel developed the proposals, although the American Pulpwood Association and some industry people assisted in developing the New Hampshire proposal.

The American Pulpwood Association is available to assist the corporation in designing a program for woodsworkers. They will also train the teachers in the program, and provide teaching materials. Some of their training materials are attached.

Companies selling heavy equipment, such as Caterpillar, are also willing to train people on the use of their equipment.

BEST COPY AVAILABLE

The Forest Service is willing to provide some training materials and some minimum advice on woods operations, particularly in relation to proper logging methods on National Forests. The Forest Service mentioned the possibility of setting aside some land in the Holly Springs National Forest for a training site.

AVAILABILITY OF RAW MATERIALS

The Bidding Process for Publicly-Owned Land: The National Forests of the United States are managed by the Forest Service, U.S. Department of Agriculture. Timber from these forests is regularly put up for sale, on a sealed bid basis, to commercial operators or to local residents. The amount of timber sold by the Forest Service has more than trebled during the past 16 years: in 1966, 12.1 billion board feet were cut, as compared with 3.5 billion in 1950. Even with this increase, however, the annual cut from the National Forests is still a mere trickle when compared with the volume available. According to E. W. Schulz of the Forest Service, "Allowable pulpwood cuts. . . are moving up substantially and we are willing and able to market this material -- but can't without customers. We could and would increase annual allowable cuts if imminent markets were in sight."[2] Mississippi's sell goal for FY 69 is 144 million board feet, the greatest concentration of cutting being in De Soto Forest. The Mississippi Forest Service has put out a time schedule for 1969, listing the time of year when each sale will be advertised for bids (see attached).

The Forest Service is required by law to make formal public advertisement, for at least 30 days, of all sales over $2,000 in appraised value. Sales of lesser amounts may be advertised informally for shorter periods when more than one prospective purchaser is interested. Certain sales are regularly set aside for small businesses, as authorized by the Small Business Act of 1958. Advertisements specify such items as the date and place of bidding, location of sale, volume and species offered for sale, and the minimum bid price acceptable to the Forest Service, based on their appraisal of the timber's fair market value. In addition, a sale area map of acreage to be cut is sent to the prospective bidder. Trees to be cut are marked or otherwise designated for cutting and the Forest Service encourages prospective bidders to examine the timber and make their own estimates of the volume and value before bidding. All items in the sale must be bid on, and the purchaser is responsible for the removal of all species and products in the sale, although he is permitted to subcontract part of the job to another operator.

The Forest Service requires a deposit to accompany the bid when submitted. Deposits of unsuccessful bidders are returned upon award of the contract to the highest bidder. The deposit of

---

2/ E. W. Schultz, "Pulpwood Supply-Demand Situation on Southern National Forests," Southern Lumberman. December 15, 1967, 118-120.

the successful bidder is retained as advance payment on the timber to be cut. This is a pay-as-you-cut operation, the bid deposit serving as the first advance payment in advertised sales. In all but the smaller sales, the successful bidder furnishes a performance bond which is not less than 10 per cent of the total value of the estimated quantities at bid rates, rounded to the nearest $100 if bid value is between $2,000-$10,000, and to the nearest $1,000 if the bid value is over $10,000.

The successful bidder must pay an additional cost for erosion control measures and will be required to provide some roadbuilding except on smaller sales. The estimated costs of roadbuilding, erosion control, and similar items are taken into consideration in appraising the timber. These additional costs to the purchaser required by the Forest Service will make cutting on publicly-owned land somewhat higher than on private land.

The time allowed for completing the contract varies in accordance with the volume. The average period for completion is one to two years.

Attached is material on the bidding process received from Forest Supervisors of the Southern states. Included are sales advertisements for Mississippi, Arkansas, Alabama and North Carolina. In many of these sales only one bid was received by the Forest Service, often for only a few cents more than the minimum acceptable amount. (See letter from South Carolina Forest Supervisor.) The Corporation staff will have to thoroughly analyze this bidding process during the early stages of the operation. With such limited competition in many of the bids listed for the past year, the Corporation should be able to gain access to a great deal of raw material. In addition, negotiations with the Forest Service regarding sales under $2,000 might result in a special arrangement being made to permit the Corporation to pick up these sales for a nominal sum, both for cutting and for training sites.

Private Land: Access to stumpage on privately-owned land introduces the need to negotiate directly with a number of small landholders, or in some States with private corporations that own the land or control the stumpage rights. In these cases, it will be necessary to spend some time negotiating adequate stumpage before locating a sawmill plant.

In addition to the above sources, the sawmill corporation should negotiate to obtain timber directly from cooperatives and black producers and, in time, from white producers.

COOPERATING ORGANIZATIONS

Contact has been made with a number of organizations regarding their role and cooperation on this project as described below. (The correspondence is attached.)

BEST COPY AVAILABLE

The Forest Service, U.S. Department of Agriculture: The Forest Service sells timber rights on publicly-owned land, as described above, and thus represents a major source of raw material. The Forest Service has a considerable body of information on the total industry, and will be interested in assisting the corporation in any way possible, including assisting in establishing and operating a training center on National Forests, and advising on the cutting of timber.

The American Pulpwood Association: The APA is very interested in participating in training programs. The APA will train the staff trainers and provide publications, materials and supplies.

Equipment Manufacturers: The equipment manufacturers, such as Caterpillar Tractor Co., and Corley Manufacturing Co., Chattanooga, Tennessee, will provide engineering services to the corporation regarding the right type of equipment to use in the woods, in trucking operations and in the sawmill. Such services are the usual free services provided by equipment manufacturers. (See their attached brochures.)

Caterpillar participated in a training program in South America and donated the use of some heavy equipment at no cost to the project. The same arrangement may be possible for the initial Mississippi training project, particularly if the NAACP Legal Defense Fund makes such a request of the President of the Caterpillar Corporation.

U.S. Department of Labor: The training programs of the USDL are discussed above.

U.S. Office of Economic Opportunity: Education and training programs for farm workers and demonstration programs are discussed above.

U.S. Department of Commerce: The Economic Development Administration (EDA) in the U.S. Department of Commerce provides business loans, funds for feasibility studies, funds for training programs, and technical assistance to business groups. EDA often coordinates other public programs that are critical to the success of economic development programs. EDA is very interested in economic development programs in the southern forests.

STEPS TO TAKE TO ESTABLISH A PROGRAM

1. A Sawmill Corporation: Develop a corporation to seek and invest capital in a sawmill operation and to operate the total program. The corporation would also launch out into other areas of the South with other sawmill and woods operations, as well as developing a variety of wood products industries, such as furniture and lumber for the housing industry, as discussed above.

BEST COPY AVAILABLE

2. Developmental Funds: Some developmental funds will be needed to organize the program. Initially, at least three staff persons should be hired by the NAACP Legal Defense Fund to serve as the sawmill corporation developmental unit and they would eventually become the nucleus of the management team when the sawmill corporation begins to operate. One person should be experienced in the field of management. He would be responsible for coordinating the entire developmental effort. A second person should be experienced in sawmill operations. The third should be experienced in logging operations. These three should be backed up by outside experts and consultants.

Part of the time the three-man developmental unit should be spent visiting other sawmill and logging operations. The NAACP Legal Defense Fund would have to arrange such an internship program with large mills and logging operations outside the South.

The three-man team should work very closely with the feasibility study group, as they would have to make an input into the study, and they would be responsible for implementing the recommendations of the feasibility study.

About $65,000 would be needed to pay salaries, travel, administrative expenses, consultant fees, etc., for the developmental staff.

There are two possible sources for such developmental funds: the Ford Foundation and the OEO Research and Demonstration Division, Washington, D. C.

The national NAACP Legal Defense Fund should immediately approach the Ford Foundation for a $65,000 developmental grant. In addition, the Ford Foundation should be asked for a commitment of investment funds to match EDA loan funds. Assuming a $1,000,000 investment, the maximum EDA loan would amount to $650,000 which means a loan from Ford of $350,000.

If Ford is not interested in moving quickly and positively on this request, a proposal could then be drafted for the OEO Research and Demonstration Division, which has expressed an interest in funding black entrepreneurship programs. I am recommending Ford first, because of the difficult financial situation facing OEO.

3. Funds for a Feasibility Study and Sawmill Design: A feasibility study would have to be developed which would: locate a specific site; identify the specific type of timber and the end product uses of such timber; identify the exact type and cost of equipment needed in the woods, for the trucking operation and in the sawmill; design the sawmill; locate markets for pulp and for the sawmill products; line up sources of supplies of both public and private stumpage; develop a financial plan for the total operation, including fixed capital and working capital, and locate funding sources to supplement the EDA loan; and develop the application for EDA loans.

The cost of such a study is in the neighborhood of $40,000. In addition to the Ford Foundation and OEO, the Economic Development Administration could fund all or a major portion of such a study, including technical assistance during the year in starting up the sawmill operation. EDA would be more likely to fund this study if they knew that the Ford Foundation was willing to fund the developmental staff and to be interested in providing the investment funds needed to match EDA investment funds.

Stone and Webster, an experienced engineering firm, is now developing a proposal for a feasibility study which they should submit within the next week or two to me.

The attached EDA materials describe how to apply for EDA technical assistance services, including EDA funding for a feasibility study.

4. The national NAACP Legal Defense Fund staff should open negotiations with several pulp firms (International Paper Co., Plywood Champion Papers and St. Regis) with major operations in Mississippi to discuss the project and ask for agreements from them to purchase pulp from the corporation, and to gain stumpage rights on land owned by the pulp firms. These discussions should cover future sites as well as the initial sawmill program. Later such discussions should be expanded to other firms and other states.

5. The national NAACP Legal Defense Fund staff should open negotiations with the U.S. Department of Labor for training funds for the sawmill operation as well as the logging operations. These discussions should cover future sites, as well as the initial sawmill operation as the problem with the State Employment Service will have to be dealt with in other southern states as well as Mississippi.

6. The NAACP Legal Defense Fund should hold a strategy meeting with other groups working in the south to discuss the overall economic development question and begin structuring a retail, wholesale, production mechanism to support the initial sawmill operation, as well as to lay the groundwork for additional sawmill operations.

JOB DESCRIPTIONS

WOODSWORKERS

Logger, All-Round--all-round man; stock cutter. Fells trees and prepares them for final logging operations, performing any combination of the following tasks: Saws or chops down trees. Cuts limbs from felled tree (Limber). Saws felled trees into logs of specified length (Bucker). Fastens drawing noose about logs for removal to loading or mill (Chockerman). May drive tractor to haul logs from forest.

Log Marker--Measures and marks bole (trunk) of felled trees for cutting into log lengths, using scale, measured rod, or tape rule, and crayon or ax. Estimates waste due to shape of tree or defects and lays off bole to obtain maximum timber yield consistent with standard log lengths. May estimate board feet content of felled trees and record estimate as work record of individual or crew.

Log Scaler--Estimates marketable lumber content of logs: Measures log, using scale stick, Scribner decimal scale, or other measuring devices. Estimates loss of board footage caused by sawing waste and defects, and rejects log containing excessive amount of unsound lumber. May grade and mark logs for use as veneer. May operate bull chain. May be designated according to location of work as Deck Scaler, Landing Scaler or Pond Scaler.

Log Grader--Grades logs at mill pond, logdeck or in the woods. Cuts notch in log with ax to determine condition of log for mill processing according to mill standards. Notches or marks end of log with stamping ax to designate it for veneer, pulp, or lumber processing. May estimate board footage.

Log Loader--Loads logs onto trucks and railroad cars, using skid poles, cant hook, or peavey. Positions skid poles with one end on ground and other end against vehicle to form log rolling incline. Hooks cant hook or peavey onto log and pushes or pulls handle of cant hook or peavey to roll log up incline and onto bed of truck or railroad car.

Log-Loader Operator--Operates truck-mounted lift to load logs onto flatbed truck. Starts truck engine. Moves lever to release cable and lower lift arms to ground. Inserts extension into lift arms. Rolls log onto lift extension arms, using cant hook. Moves lever to raise log and throw it onto bed of truck.

Logging-Equipment Mechanic--Adjusts, maintains, and repairs gasoline and diesel-powered logging equipment and acessories, such as air compressors, cranes, donkey engines, and road graders. May overhaul and repair tractor and automotive vehicles.

BEST COPY AVAILABLE

Logging-Operations Inspector--Inspects logging operations to insure that workers adhere to correct provisions and safety laws and to prevent loss of timber through breakage and damage to residual stands. Examines logging area for utilization practices, sanitation, observance of boundaries and safety precautions, and prepares report of logging efficiency and progress.

SAWMILL OPERATORS

Sawmill Worker--Performs any combination of following duties in preparing logs for cutting into lumber and storing cut lumber in sawmill. Unloads logs from trucks or cars. Rolls logs onto sawmill deck (Deckman). Examines logs for defects, such as imbedded pieces of iron or stone, decayed wood and splits, and marks them for removal by other workers. Rolls logs from deck onto log carriage (Log Turner). Rides log carriage of head saw and adjusts position of logs in carriage to cut planks of required thickness (Block Setter). Sorts and guides planks emerging from saw onto roller tables or conveyors for trimming edges. Straightens lumber on moving conveyors (Lumber Straightener). Operates sawing machine to straighten edges of rough lumber (Edger Man). May operate saws, and power hacksaws to slot, groove, miter, and trim tubing, bar stock, sheet metal and plastics. Mounts specified saw blade in machine, using handtools. Adjusts speed, feed, and blade tension. Tilts saw or table and adjusts guides, stock blocks, or fixture at specified angle. Bolts and adjusts automatic feed attachment on power hacksaws. Welds and anneals bandsaw blades, using saw attachments. May lay out guidelines and reference points on stock or parts, working from blueprints, sketches, templates, or sample parts. May lay out and fabricate wood fixtures and guide blocks.

Deckman--Rolls logs from trucks or conveyors to log deck, using peavey. Arranges logs on deck in position for feeding logs to saws. May move levers to activate mechanism that kicks logs from conveyor to deck. May use ax or pick to remove undesirable material from bark, such as stones or nails.

Block Setter--Tends equipment that alines log to be sawed into planks, riding on log carriage. Moves control to set carriage blocks and dogs that hold logs into position. Starts carriage that moves log toward headsaw on signal from Head Sawyer. Observes dial to ascertain that carriage blocks are set to hold log to be cut into planks of specified thickness. May replace saw blades in headsaw.

Dogger--Rides on log carriage of headsaw and sets dogs (holding spikes) that hold logs to carriage for sawing. Raises dogs high enough to clear log and rolls log onto carriage, using peavey. Pulls lever to drop dogs that dig into log and hold it against carriage blocks in sawing position. Releases and resets dogs each time log is turned on carriage for further sawing. May replace saw blades. May work in 2-man team.

BEST COPY AVAILABLE

Trimmer Man--Operates bank of circular saws to cut out defective sections of boards. Scans boards as they move on conveyer to saws to determine which cuts will produce highest grade. Moves levers to raise or lower one or more saws along trimmer bed to cut lumber into lengths and trim out defects. May regulate flow of lumber to saws.

Edger Man--Automatic --Operates multiple-blade sawing machine and conveyor system from panel board to straighten edges of rough lumber and saw lumber into boards of prescribed widths. Starts conveyor to move lumber and scans board as it passes to determine cut that will produce highest quality and grade. Presses panel buttons to space saw blades and trips pedal to start feed rollers leading to saws.

Gang Sawyer--Automatic-- Controls carriage to feed log to machine equipped with multiple saws, to saw log into dimensional lumber by moving levers and pedals on panel board while riding on carriage. Moves control to transfer log from conveyor to log carriage, position log for sawing, and aline log with saw blades. Advances carriage to feed log into saw and keeps pressure against saw while log is cut.

Heading-Saw Operator--Operates heading saw to cut pieces of heading material from heading bolts (lengths of split logs). Loosens nut and adjusts guides to thickness of heading material. Stands bolt on end in swing carriage of machine. Moves bolt against guides and clamps it with tooth-edged clamp. Starts saw and pushes swing toward saw to cut strips of heading material from bolt. Withdraws swing, removes heading strip, and repeats cuts until bolt is completely sawed.

Head Sawyer--Automatic--Operates head saw, log carriage, and conveyor system by means of panel buttons and hand and foot controls to saw logs into rough cants or boards. Starts conveyor that transfers log to log carriage with kicker arms. Activates log turners that turn log, scans log to ascertain best approach for trimming and cutting, and alines log with saw. Sets specified depth of cut and activates carriage to force log against saw blade to cut board. Scans exposed face of log after first cut to determine grade and size of next cut.

Packager, Head--Operates double-end trimming machine to saw simultaneously several pieces of lumber to identical lengths. Sets movable saw at specified distance from stationary saw. Stacks lumber in machine and butts end of lumber against guide block. Moves lever to clamp lumber in machine. Starts saw that cuts off ends of lumber. Places sawed lumber on conveyor.

Rock Sawyer--Operates circular saw to cut wide kerf in bark of log in front of and in line with headsaw to remove rock, gravel, or tough bark likely to damage headsaw.

BEST COPY AVAILABLE

JOBBER (Logging Contractor)

Arranges contracts with mill, logging company, governmental agency, or individuals, to harvest timber. Coordinates activities of persons engaged in logging operations. Inspects areas to be logged to estimate costs of operation and submits bid for contract. Engages men and equipment, and organizes, schedules and supervises operations according to production requirements, safety laws, and terms of contract. Consults with company and governmental foresters and inspectors regarding logging method and safety and efficiency of operation. May keep time and production records of crew.

Charlotte, North Carolina 28802

Dear Bob:

Sorry to be so slow in getting back to you. What I said about Covington, Virginia was that I lived there for a year and a half and graduated from high school in Covington and have never returned. I do not have any good contacts regarding West Vaco. However, I think I could give some assistance in uncovering a few.

Sincerely,

Emory F. Via
Director

Dear Emory:

While going through Atlanta the other day I did not have a chance to stop and talk to you. I was simply wondering if you could tell me the status of the MIND Program in Macon and Rome, Georgia and anywhere else where that program may be operating.

Any information you could provide on MIND Program would be appreciated.

Thanks much.

Sincerely,

Bob

Dear Bob:

As I have attempted to explain before, the programs in Macon and Rome are not run by MIND. They are operated by the U.S. Research Development Corporation. These particular programs are financed through an experimental grant from the Ford Foundation to the American Paper Institute.

These programs have been operating more than a year. There have been some difficulties, some missteps, and some corrections. They were recently refunded. The aim of the programs is to up-grade the employability of existing workers and it is also attempting to provide some new purposes to those not yet employed.

I have not yet looked at the operations in Rome and Macon for nearly a year, but my impression is that they are on a sounder basis. I do have some other information in my files, if you are interested.

You may recall that these programs were involved to some extent in an EEOC settlement and court case. I do not know where else in the South USR & D is operating, but I could probably find out.

Please let me know if I can be of further assistance.

Sincerely,

Clear Copy On Skin

Miss Jean Fairfax
NAACP
Legal Defense & Educational Fund, Inc.
10 Columbus Circle
New York, New York 10039

Dear Jean:

I have your request fof leads to Black Leaders in Appalachia. Did the same material go to the state councils on human relations, especially Virginia, South Carolina, and Tennessee. Did something go to Galen Martin in Louisville? There are one or two people in TVA that might be helpful. In a few cases the State AFL-CIO would have useful contacts. The Labor Education Program at the University of West Virginia has run a training program throughout much of Appalachia for union people working on poverty problems. The staff there might have some leads.

I have asked others on our staff to pass their suggestions on to me. If you would like any assistance on the suggestions in the above paragraph, let me know.

Sincerely,

Emory F. Via, Director
Resources Development Center

July, 1970

Dear Friends, Emory

This is a preliminary and very impressionistic report of my recent visit to Australia and New Zealand. It would be better to wait until materials which I collected and documents which I have ordered arrive but I am eager to share some thoughts while they are fresh for whatever advantage first impressions have. I'll correct them later after I've studied the literature and talked with seasoned observers. So this is a personal letter to a few friends. No quotes, please.

Last March the New Zealand Race Relations Council invited me to participate in a seminar on Race and Development which was scheduled for early May. I accepted and agreed to present a paper on "Race and Conflict" - a topic about which American blacks have more than academic knowledge. The Council's planning committee then postponed the seminar and suggested that I should come anyway on a speaking tour. I made a counter proposal, which was accepted, that I would make a private, fact-finding trip with no major public appearances, the purpose of which would be to assess race relations and to make recommendations relative to the sharing of resources and experiences between the USA and New Zealand and to the involvement of New Zealand in the World Council of Church's new Ecumenical Programme to Combat Racism. With plans to go to New Zealand, I then decided to make a shorter visit to Australia, which was arranged by WCC and the Australian Council of Churches.

Since we Americans tend to lump Australia and New Zealand together, I must begin by reminding my fellow citizens that these are not twin states that can be crossed with a Staten Island-type ferry! Separated by 1500 miles of ocean, these two distinct nations have quite different political and social histories and project unlike images. Australia is almost 2/3 the size of continental USA; New Zealand's two islands have about 2/3 the square miles of California. Australia is a commonwealth with problems of Federal-state jurisdiction which are very familiar to Americans. New Zealand functions as a unitary government from Wellington with relatively minor decisions made by local governing bodies. One gets the impression that Australia sees herself as potentially a big

Contributions are deductible for U. S. income tax purposes

power on the world scene for she sits on vast unexploited resources. Sydney ranks easily as one of the world's major cities with handsome modern buildings and a spectacular opera house under construction. Newspapers from all over, including the daily Wall Street Journal, are available. Downtown Wellington, the capital of New Zealand, with its two and three story wooden buildings and even the largest city, Auckland, are unpretentious in architecture. The visitor feels the isolation of New Zealand from current winds of change and concern about the inability to cope with developments (such as Britian's participation in the European Economic Community) which expose New Zealand's dependence on her foreign markets. It is said that New Zealanders are more English than the English. If so, this seems to be a cultural affinity to an England of an earlier generation.

Few would doubt that Australia lines up with the nations guilty of white racism and of disparities between the economic status of the poor and the affluent. On the other hand, New Zealand has had the reputation for model race relations and for pioneering in social legislation. It was the first nation to grant the suffrage to women. With a welfare state philosophy, it has provided a basic economic floor, broad health benefits and extensive state-subsidized housing and has had practically no unemployment. One gets the feeling that New Zealand has eschewed wealth and glitter for the few in order to guarantee comfortable living for all her citizens. Friends who took me to see state housing complained about the dreariness of these developments. It was obvious to me that they have never seen real slums or public housing USA style!

Having attended in Geneva the first meeting of the Advisory Committee to the World Council of Church's new Ecumenical Programme to Combat Racism, I boarded a BOAC flight in Zurich on Wednesday, June 3, at 6:30 p.m. which stopped in Teheran, Bangkok and Hong Kong before it deposited me in Darwin, Australia, on Friday, June 5, at 3:00 a.m. No one in his right mind would travel like this without a break but fortunately I do not approve conventional wisdom so I was able to be in the Supreme Court of the Northern Territory Friday morning to hear witnesses testify in the Yirrkala land rights case, the first major civil action suit brought by Aborigines in Australia.

During my two days in Darwin, I met Yirrkala Aborigines who had come from their home 400 miles east and conferred at length with John Little, one of the attorneys in the case, and with Mrs. Nancy Williams, an American anthropologist who is

studying the area. I interviewed Philip Roberts, an Aborigine liaison officer for the government, and Margaret Valadian, a social worker who is one of Australia's three Aborigine university graduates. Mr. and Mrs. Jack Goodluck, who work with the Methodist Church and who know the area well, were extremely helpful in briefing me about the overall situation in the Northern Territory.

I was in Sydney for three days on a schedule arranged by Frank Engel, general secretary of the Australian Council of Churches, wh is very knowledgeable about the land situation. I had excellent sessions with ACC and mission board staff members, students, lawyers, Aborigine leaders, representatives of civil rights organizations and community workers. I also met some American young people who are in Australia under the auspices of the Ecumenical Institute of Chicago. I had a very good interview with a key government official, Dr. H. C. Coombs, head of the Australian Council on Aborigine Affairs.

I spent June 10 in Brisbane, Queensland, with Kath Walker, Aborigine poet and civil rights leader, who had participated in the Notting Hill seminar in 1969 and who had invited me to sit under her mango tree to receive an all day stream of visitors -- Aborigines who she said could tell it to me like it is! Among these were a recently radicalized staff member of One People of Australia League (OPAL) and an Aborigine clergyman who had visited American Indians who had presented him with a magnificent feather headdress which he was delighted to display. He was also great with the didjeridoo, the Aborigine equivalent to the basoon. Stan Davey, the former executive secretary of FCAATSI was visiting Kath at the time and provided useful background information about this organization's present problems and about the land situation in Western Australia, where he is now living.

FINDINGS AND OBSERVATIONS

1. Everyone I met corroborated a statement made to me by a high official, that Australia's history of race relations is "appalling" and that it is a miracle that the Aborigines on the mainland were not completely exterminated as they were in Tasmania. Racism has been implemented in almost unbelievably cruel practices, such as the forcible removal of half-caste children from their Aborigine mothers. (I shall never forget the deep sadness which came over the face of a woman I met as she told me that she had no idea who her people are because she had been taken from her mother.) Aborigines have been non-persons; they have not even been included in the census.

2. Race relations now vary widely. Until recently, Aborigine affairs have been a state and not a Federal responsibility. I was surprised that no one could give me a current overall analysis of the civil rights of Aborigines with a state by state breakdown. Some states have very few Aborigines. South Australia has taken the most progressive steps and it is heartening to know that the Honorable D. A. Dunstan whom I met in London in May 1969 at the international consultation on racism has since become the premier. Queensland, Western Australia and the Federally-administered Northern Territory are apparently the areas of greatest concern. Living "under the Act" in Queensland is offensive and burdensome to Aborigines who are denied freedom of movement, control over their earnings, etc. The referendum on May 27, 1967, which authorized the inclusion of Aborigines in the census and which gave the Federal Government power to legislate in re Aboriginal affairs, is considered a major landmark in race relations.

In response to my queries about the prospects for a national civil rights statute, I got different answers. Most persons I met would agree with the need but see little chance of getting such legislation at the present time. Dr. Coombs told me he does not think more national legislation is needed because where the Federal and state governments have concurrent jurisdiction the Federal can assume jurisdiction and prevail. The only legislation needed would be appropriations. He said that he believes Queensland is in violation of the United Nations Convention Against Discrimination. The role of his Council which is in the Ministry of Aboriginal Affairs is to undertake research, to advise the government, to coordinate the activities of the states and to facilitate contacts between whites and Aborigines. Coombs is against special agencies for minorities and sees his role as encouraging the appropriate departments (education, housing, health, employment, etc.) to become more effective in responding to the needs of the Aborigines. I got the feeling that he feels restricted under this Administration which emphasizes the persuasive role of the Federal officials in relation to the states (where have I heard that before?). Federal officials, including Coombs, were in Queensland while I was there, conferring with state officials but most of my contacts were not optimistic about the outcome.

3. Before the Europeans came, there were between 200-300,000 Aborigines. By the 1930's the population had fallen to 50-100,000. Current population figures are guesses since Aborigines have not been counted in the census and because there is difference of opinion concerning how to identify the part-Aborigine. Persons who identify themselves as Aborigines have been conservatively estimated at 140,000 although Aborigines whom I met believe that the nation will be surprised at the size of the group when the census has been completed. Aborigines are the fastest growing section of the population - the birth rate is twice that of whites. 50% of the Aboriginal population is under the age of 15. If the current high infant and child mortality rate is reduced (the infant mortality rate is three and a half times that of other Australian babies; the death rate for the second year of life is twenty times the Australian average; in one town 66% of Aboriginal children registered died before they were four years old), white Australians will be facing an increasingly larger minority group.

4. Land is the central issue. The Aborigines "were disinherited of almost all their lands by the white population. The only land now available to them is the reserves which are Crown lands to which they have no title (and which are) vulnerable ...to military and scientific requirement...or economic development. A landless people is a rootless people. A rootless people tends to become an indigent people." (National Missionary Council of Australia, June, 1963.) There are three kinds of settlements: mission stations, government settlements and cattle stations. Some mission stations date from the last century; others are only 30 years old. A brochure of the Australian Council of Churches states:

> The missions were established out of Christian concern for the people. This concern was for both their spiritual and material well-being, so the missions provided religious instruction and worship, and centres for community, life, for education and medical care. They were also places where the Aborigines might gradually adjust themselves to the pressures of the advancing white civilization. Some were begun in the 1930's quite deliberately to be buffer areas and adjustment centres for nomadic tribes. In time, many Aborigines chose to adopt a settled life where

food and goods they valued were available. As a result, many mission stations have taken on the characteristics of small urban communities.

A church worker with a somewhat different perspective told me that the churches established stations as hand-outs for government rations and tobacco. They convinced the Aborigines to permit children to remain in residence for education. Thus communities were built up and the first cadre of educated Aborigines was created. Now there are no rations although the government provides "training subsidies." Idleness and apathy are real problems on these stations because paternalism was built in from the beginning. He stated there is a tendency of Aborigines to see their work on the stations as just keeping the white man's thing going.

In recent years, the churches have been rethinking their role. So far as I could find out this has meant some new statements of policy, the inclusion of Aborigines in participation in decision-making at the stations and intercession by churches to secure economic benefits for Aborigines as companies move in to exploit mineral and other resources. Churches have turned land over to the government but I do not believe that any churches have actually transferred land to the Aborigines.

Two crises over land were in the news while I was in Australia. One is the Yirrkala land rights case. A billion dollar bauxite deposit in the Gove Peninsula in the northeastern part of the Arnhem Land Aborginal Reserve is being exploited by Nabalco Proprietary, Ltd., a consortium under 70% Swiss and 30% Australian ownership. Eleven Aboriginal tribes live in Arnhem Land which is almost the size of Virginia. Under the leadership of Dadaynga Roy Marika, the 600 people of the Yirrkala village submitted a petition written on bark and later filed suit against Nabalco and the Australian Government to establish that they are the rightful owners of the land. Initial funds for the litigation were provided by the Methodist Church but the government has since agreed to pay expenses not covered by private funds. (The government is suing itself!)

John Little, one of the team of lawyers for the Yirrkala, told me that the Northern Territory was

originally part of South Australia. The articles patent conferring this land grant explicitly stated that the land use of the Aborigine people must be respected. The legal strategy is to prove that the Yirrkala people have occupied the land from time immemorial, followed accepted routes for hunting and successfully dealt over the years with invaders and with outsiders who came in to trade but did not take over the land. When I asked him why the Methodist missionaries had not initiated action immediately when the firm first announced its intentions, he said that the missionaries were at first more interested in the economic advantages which the mining would bring. They welcomed the opportunity to sell their produce and to make bricks needed for construction. A new city for 4000 employees is being built. I got the feeling that concern for the Aborigines' rights was a later development but I must check this out. At any rate even though the mission's lease has expired, it seems to be playing an active role in the suit now. A white woman and a young black man from the mission served as interpreters the day I was in court.

When I asked John Little about the possible outcome of the litigation, he said that the case would certainly go to the highest court. Whatever the outcome, he thinks it will result in a Royal Commission to review the entire land rights situation. The Yirrkala people have been brought from their isolation into the middle of this international battle, but he did not know of any efforts to help the people plan for their future. Both John Little and Nancy Williams, the American anthropologist, have high regard for the intelligence of the Yirrkala and the quality of their leaders. She observed, however, that they really have no comprehension of the potential impact on their way of life of this mining operation. Among other things it will produce a red mud which renders areas unsafe. I met Mr. Marika at the court and gave him a clipping from the New York Times which was an article on the suit with his picture that had appeared a few days before I left the USA. Was he surprised! I wish I could have discussed with him what the Yirrkala's goals are: Do they want to throw the industry out or to negotiate a tough agreement for royalties, economic development, training, jobs, etc.?

A very different kind of crisis has developed at the Vestey's Wave Hill cattle station. In August 1966, Gurindji employees walked off the cattle station operated by the Wave Hill Pastoral Company, Ltd. (British) which has leased 6000 square miles, at 10¢ a square mile, until the year 2004. Protesting poor wages and working conditions, the Aborigines petitioned for the return of their tribal land, about 500 square miles. They left the welfare settlement at Wave Hill and established a strike camp on the banks of the Wattie Creek. The government has rejected the petition and has pressured them in various ways to return to the government-operated settlement. University students have publicized the plight of the Gurindji and have assisted them in building permanent homes at Wattie Creek. The situation seems to be at a stalemate.

There are a number of problem areas but I also heard about opportunities and about efforts to make positive approaches: Catholic interest in buying a station for a cattle ranch; an area abandoned by the Anglicans which has some freehold land which could be developed into a good cattle ranch and peanut farm; the development of an Aborigine-owned cooperative bakery on land controlled by the Anglicans; the role of the Anglicans on Groote Island where they bargained with the Broken Hill Proprietary Company for royalties and guaranteed job opportunities, etc.

5. Great interest was expressed about the economic advancement of the Aborigines as individuals as well as the economic development of their communities. Discriminatory wage rates were mentioned but I was unable to get specifics. Unemployment in Australia generally is negligible; apparently, it is a way of life for Aborigines. Many live in places where there is no work; many have had no training. Opportunities for Aborigines to work above the unskilled level are almost nonexistent. The government has made $5 million available to help Aborigines go into business but my Aborigine contacts told me that very little information has been disseminated about this money and it is extremely difficult to qualify for these grants. Later, when I asked Dr. Coombs whey the money was moving so slowly, he said that the government wants a high success rate for the initial grants. Funds are also available for community economic development from government and from the Aboriginal Benefit Trust Fund which receives royalties for lands. One contact observed that plenty money is available for community development; lacking are human resources, imagination and projects.

Margaret Valadian is scornful of the focus of the militant Aborigines on rights and told me that the emphasis should be on community planning. She would like to see a national trust created with money from corporations which would be used for feasibility studies, planning and the systematic development of sound projects.

I visited the Cooperative for Aborigines in Sydney, a hostel for Aborigine boys who are brought to the city for training in organizing cooperatives. It was clear that these delightful chaps are more interested in individual job opportunities. The hostel provides the needed contacts and support for them.

6. Education is of course an urgent issue. There are only three Aborigines who are university graduates. One of them, Margaret Valadian, has a social work degree from Hawaii and has traveled extensively in the USA. There have been many efforts, especially through scholarships, to increase the number of Aborigines in the universities. However, there have been only about six students a year and the drop out rate has been high.

The National Union of Australian University Students Aboriginal Scholarship Scheme (ABSCHOL) began as an effort by white university students to encourage the enrollment of Aborigines. As the government has increased its scholarships, ABSCHOL has shifted its program. It is now more interested in scholarships and other kinds of support to secondary students and it is doing significant community work. It is trying to effect exchanges in curriculum and attitude changes in educators so schools will relate more effectively to Aborigine children. ABSCHOL has conducted field studies to document injustices suffered by Aborigines. It is deeply involved in the Wattie Creek situation. Law students have investigated police practices. With the help of faculty members, they are planning a community legal aid project.

There is tremendous interest in Australia in early childhood education. Alex Grey who did some pioneering work in New Zealand in parent-run centers is now affiliated with the University of Sydney and has brought in Maori women to help promote centers among Aborigines, especially in New South Wales. Funds from the Van Leer Foundation in the Netherlands are supporting this work. I was asked a lot of questions about our Headstart Program.

Aborigines spoke to me of their concern to exercise more control over the education of their children, to have a curriculum which will incorporate the wisdom of their legends and to have their languages taught in the schools.

Australia has compulsory school attendance laws but I got different responses when I asked whether they apply to Aboriginal children.

7. Assimilation has been the policy of the government. This seems to have been based on the assumption that Aborigines would choose to adopt the ways of white Australians and that government should assist those individuals who do so. This policy is now being challenged by Aborigines who have apparently decided they do not wish to disappear as a distinct ethnic group. An official refers to the "phenomenal revival of Aboriginal ceremonial life... which is attracting back to tribal participation Aborigines who had grown away from their own communities, even part-Aborigines who had had previously no established tribal background." Several persons commented to me on their growing sense of identity as Aborigines rather than as members of tribal groups.

The government's Arts Council is promoting cultural revival. Dr. Coombs told me of the sponsorship of a traveling theater, apparently reviving an old Aborigine art form. I also heard of an Aboriginal Drama Group which will begin soon in Sydney as campus theater. There is an Australian Institute for Aboriginal Studies in Canberra but I got the impression that this government body has the concern of the archivists to preserve something which may die out rather than to promote the contemporary expressions of a living culture. Aware of Aborigines' interest in language development, I asked Dr. Coombs about the role of government in promoting bilinguaism. He said there are about 700 Aborigine languages and that there are only a few places, perhaps in South Australia where bilingualism is feasible. Coombs impressed me as a very compassionate and candid public official but even this liberal white man did not comprehend the depth of feeling I had sensed in Aborigines on the language question.

Australians who have finally accepted the concept of upward mobility for individual achieving Aborigines

will undoubtedly find it hard to understand the Aborigine's rejection of assimilation and may be threatened by the political implications of development and civil rights as a communal and not just an individual concern.

8. Perhaps the most dramatic expression of demands by Aborigines to control their own destiny came earlier this year when militant Aborigines tried to change the direction of the Federal Council for the Advancement of Aborigines and Torres Strait Islanders (FCAATSI). FCAATSI, a 14-year old broadly based civil rights organization, has been a coalition of white liberals, unionists, educators, churchmen, students and Aborigines. It played a key role in getting a favorable vote during the 1967 referendum. Apparently, it has concentrated on an annual conference which may Aborigines feel was full of good will but too sentimental and without follow-up. Defeated (primarily by trade unionists) in their effort to bring FCAATSI under black control, militant Aborigines pulled out and formed the National Tribal Council which will be completely run by Aborigines. Whites may belong but without voting privileges. Many of my contacts believe both organizations are needed but deep personality conflicts may prevent the division of work and a mutually supportive program. The predominatly white churches and student groups are now trying to decide how they will line up. When I met with FCAATSI leaders (some Aborigines have remained), I got the feeling that they are pretty demoralized by the split. FCAATSI is without a general secretary; the National Tribal Council has its membership primarily in Queensland and Victoria and has as yet no assured funds which would enable it to function as a national organization.

The One People of Australia League (OPAL) in Queensland was also feeling the wrath of Aborigines at white-dominated groups working for Aborigine welfare. While I was in Brisbane, a black staff member blasted OPAL for being too conservative and has probably resigned since.

9. I found great concern about the racial dimensions in Australia's external relations: immigration policy, developments in Papua-New Guinea over which she has trustee responsibilities, relations with South Africa and Rhodesia, etc. I gather that the country has an almost

hysterical fear of communist (especially Chinese) invasion. Apparently, Chinese came into the northern area during the gold rush in the last century and also built the railroads. Some who were in business were permitted to stay; others were forced out in the 80's. Jack Goodluck said that Darwin might have been like Singapore, had the Chinese stayed. Darwin recently had a Chinese mayor.

RECOMMENDATIONS

1. Before I left Sydney, I discussed with Frank Engel my recommendation that the Australian Council of Churches should create a Commission on Aboriginal Development and Racism which would concentrate on the following:

   a. <u>Aborigine Land and Development</u>

      (1) ACC should provide the leadership and the secretariat for an ecumenical land project under which cooperating churches would inventory all lands over which they exercise any control (mission stations now operating; abandoned and unoccupied mission stations; stations which have been turned over to the government but over which the churches have some moral influence; freehold land which is not in optimum use) and develop plans to transfer the land to Aboriginal control with built-in timetables and target dates. This would mean: (1) the immediate involvement of Aborigines in the planning; (2) the commissioning of feasibility studies to determine the optimum land-use of the stations; (3) the ranking of these lands for priority

attention giving consideration to such factors as their economic promise, urgent economic needs of the people; Aboriginal leadership potential, etc.; (4) the exploration and implementation of various models of ownership, e.g. community corporations, cooperatives, etc. and (5) training in needed basic skills including management. Although the churches may now control only a small percent of the land in Australia, an ecumenical act of this scope would undoubtedly have a terrific impact on the entire nation.

(2) ACC should offer to make available to the Yirrkala people an experienced consultant on community development, preferably an African, Asian or other nonwhite person who could assist them as they think through what they should do with their land once they receive a final court decision. Whatever the decision is, their life is not going to be the same. They need to understand what kinds of options will be open to them and how these can be exercised to enhance their control over their own destiny as well as the development of their community.

b. United Nations Year Against Racism (1971)

I discovered considerable concern that Australia should have more than a perfunctory official observance of this year. ACC could coordinate the activities of private bodies to ensure a meaningful program.

c. The Civil Rights of Aborigines:
National Civil Rights and Anti-discrimination Statute

One possible project for the U.N. Year might be to convene a lawyers' committee under a distinguished jurist which would: (1) compile and analyze laws affecting Aborigines state by state; (2) hold hearings around the country to get documentation on the actual status of the civil rights of

Aborigines; (3) draft a model national civil rights statute; (4) involve the mass media in extensive publication of this material.

d. Jobs, housing, education, police-community relations, etc.

Action programs could be developed based on information gathered above. One would hope that the National Tribal Council or a reorganized FCAATSI would provide the lead in these areas so the role of the churches might be primarily supportive.

e. The racial dimension of Australia's external relations (immigration, relations with South Africa and Rhodesia, sport, Papua-New Guinea) should also be the concern of this Commission. Since involvement in these issues tends to result in statements rather than action projects which restructure institutions, I would give this item a low priority although I think it should be included in a total program.

2. RECOMMENDATIONS TO THE WORLD COUNCIL OF CHURCHES:

a. WCC should encourage the ACC to undertake the Aborigine Land and Development Project as a project of WCC's Ecumenical Programme to Combat Racism. WCC should agree to provide matching funds for the secretariat of this ecumenical effort (Frank Engel estimated that expenses for staff salary and travel would be around $16,000) with the understanding that the financing of feasibility studies would be raised separately from government, corporations, etc.

b. Through its development agencies, WCC should provide a community consultant to the Yirrkala people.

c. WCC should advise Swiss churchmen about their country's involvement in the economic exploitation of the Yirrkala and assist them in getting the facts and in putting pressure on the investors to guarantee justice to these Aborigines.

d. WCC should advise British churchmen about the role Vesey's is playing in denying to the Gurindji tribe their basic rights and should suggest ways of exposing and correcting this situation.

e. In view of the Aborigines' sense of common cause with the Indians of North America (and also because they may have too rosy a picture of developments here) WCC might sponsor a strategy seminar in 1971 for Canadian Indians and Eskimos, U.S.A. Indians and Aborgines.

f. Should ACC decide to convene a lawyers' committee to investigate the civil rights of Aborigines, WCC should provide an experienced black civil rights attorney from the USA as a consultant.

g. WCC should send a letter of congratulations to Mr. Dunstan, premier of South Australia, offer our support as he provides leadership in eliminating racism from his state and ask how we can help.

h. Contacts should be made with the Ecumenical Institute of Chicago to set up channels of communication between WCC and EIC's staff in Australia. Several persons whom I met were very enthusiastic about a seminar on urbanization which EIC held in Singapore. The American representatives now in Sydney should be sharing their insights with WCC.

i. I am ambivalent about the feasibility of sending a WCC-sponsored Team of Inquiry to Australia. This is no place for generalists because the problems are so complicated. The country is so large I wonder whether the kinds of experienced consultants whom we would want to send would have the time and energy to stay long enough to size up a wide range of problems and to visit key trouble spots. Here are the possibilities as I see them:

(1) Postpone for the time being the idea of a Team of Inquiry, especially one

which would try to include New Zealand, Papua-New Guinea, Fiji, etc. If we decide to pursue my recommendation that our WCC Advisory Committee should divide into area working parties, the South Pacific group might schedule a regional conference on racism late in 1971 and invite people from the area to meet with us. We might do some limited, low-visibility traveling around the edges of this meeting.

2. Limit the mandate of the Team of Inquiry to the land issue and make it an international team of persons knowledgeable about all phases of it including the legal rights, development, etc. If ACC decides to launch the land project, a team could be scheduled to give the project support and visibility as well as technical assistance.

ORATION

by Kath Walker

Here, at the invaders spirit place,
We, who are the strangers now,
Come, with sorrow in our hearts.
The Bora Ring, the Corroborees,
The sacred ceremonies,
Have gone, All gone.
Turned to dust on the land
That once was ours.
Oh spirits from the unhappy past,
Hear us now.
We come, not to disturb your rest.
We come, to mourn your passing.
You, who paid the price,
When the invaders spilt your blood.
Your present generation comes,
Seeking strength and wisdom in your memory.
The legends tell us,
When a race dies,
So too, dies the land.
May your spirits go with us
From this place.
May the mother of Life,
Wake from her sleeping,
And lead us on to the happy life,
That once was ours.
Oh Mother of Life,
Oh spirits from the unhappy past,
Hear the cries of your unhappy people---
And let it be so---
Oh spirits---let it be so.

++++++++

Presented at the DAY OF MOURNING' at Leichardt Street Methodist Church, 12th April, 1970.

NOTE FROM JF - This was indeed "Censored." Kath Walker was not permitted to read her oration.

CENSORED

NEW ZEALAND

Within a few hours after I arrived in Wellington on June 11, I was on national television and within 24 hours I was caught up in the midst of a demonstration. Both of these events reflect the urgency felt by many New Zealanders to break out of their isolation from the world-wide racial revolution. The television interview about racial developments in the USA - which began, by the way, with a request for comment on Roger Wilkins' recent and devasting analysis - occurred at that particular time because the prime minister who had been scheduled to appear backed out at the last minute. My protests over supplying the live, warm body for an interview which NZBC needed but for which I was unprepared were overcome by appeals to help fill a vacuum of understanding - and at prime time over the single network which reaches practically all homes. The appearance opened up some interesting contacts. Throughout my 2-week visit people stopped me on the streets to engage me in conversation and even to invite me to their homes. I was contacted by several Americans, including a black girl from Minneapolis who is in New Zealand with the American Field Service, who had some very perceptive observations about national characteristics. Because of the remarks I made on television, persons, particularly Maori, may have been more candid with me in discussing their own racial feelings than they might have been with others strangers. Everyone who responded to the program, however, was not just interested in race. Many persons, both men and women, were obviously primarily interested in my role as a woman in public life - an indication, apparently, that most women in New Zealand play very traditional, home-centered roles.

The demonstration on the eve of the departure for South Africa of New Zealand's rugby team was the climax of ten years of protest against participation in international sports with nations with racist policies. More on this later. But as I was jammed in the crowds on the street in front of my hotel, watching the very nervous police who seemed to have no strategy for handling hundreds of students, many of whose faces were half-painted black, I felt very much at home. My gut reaction and sense of apprehension were unwarranted (Did the presence of the fire engines mean mace? Would trigger happy cops shoot into the crowd?) for this was still not the USA!

I was in Wellington for four days on a full schedule planned by James P. Delahunty, who is the chairman of the seminar planning committee of the New Zealand Race Relations Council. He arranged an excellent briefing session with a group of very knowledgeable persons include a Maori woman Member of Parliament, a Maori labor leader, professors of anthropology, social administration and

education and lawyers, including an ex-United Nations official. I attended a Polynesian Society Seminar for Workers in Voluntary Service, young people engaged in tutoring and other projects in the minority community. I spent an exceedingly valuable Sunday in Porirua, a suburb of Wellington, most of the day on the Porirua Marae where I attended a national seminar for Maori wardens, ate an enormous and delicious traditional Maori meal and had a good session with some young people. Later my hosts drove me around a very extensive area of state housing developments.

Also, in Wellington I interviewed the chairman of a Maori Land Board, New Zealand's ombudsman and the Minister of Maori Affairs, had an excellent conference with about 25 labor leaders, visited the museum, was in several homes for social evenings and attended a meeting of the seminar planning committee.

From Wellington, I flew to Christchurch in the South Island where I was the guest for two days of the New Zealand Council of Churches. I attended a meeting of the Executive Committee to report on the World Council of Churches' new Programme to Combat Racism. I had a good session with two clergymen, one Maori and one Samoan, who were helpful in interpreting the racial situation in the South Island where the non-white minority is small. One evening I attended a meeting of a Catholic peace group, held in a private home, to which a Maori architect had been invited to give his views on race relations. A very pleasant morning was spent driving into the hills around Christchurch with Rev. and Mrs. Taylor and A.Gnanasunderam of Ceylon who is directing the NZCC's Church and Society Commission from an office in Auckland.

I was in Hamilton for several days as the guest of the Citizens Association for Racial Equality (CARE) and professors at the University of Waikoto. My hosts were Mr. and Mrs. David Swain (sociology). I spent a morning at the district office of the Maori Affairs Department with three Maori welfare officers. Two briefing sessions were arranged: one with persons from CARE, child welfare, youth work, mental health, the Pan-Pacific Women's Association, the Maori Women's Welfare League and students; the other with academics from education, political science and sociology. Professor James Ritchie, who has been one of the country's major researchers and writers on the Maori, has been attempting to establish a Centre for Maori Studies and Research at Waikato so it was good to get acquainted with him and with persons who will be involved in the Centre if it ever gets funded. I had two sessions with students: an evening of action songs and discussion with the Campus Maori Club and a meeting where I answered questions about

developments in the USA. Jim Milroy, a Maori welfare officer who has been asked by his tribe to go to law school at their expense, took me to Ngaruawahia to the Turangawaewae Marae.

On June 20 after morning coffee with the Donnels (Mary is a Maori of the Maniapoto tribe, has been active in CARE and is on the executive committee of the New Zealand Race Relations Council), we drove to Auckland where I spent a week as the guest of Mr. and Mrs. James Gale (he teaches at Auckland Teachers College and is the chairman of NZRRC) and their five children. I attended meetings of the executive committee of NZRRC, of the Auckland Regional Committee on Maori Adult Education and of the Church and Society Commission. At a gathering of lawyers I talked about the Legal Defense Fund's litigation program. I also spoke at a public meeting. I had a number of individual interviews with professors at the University of Auckland and attended a class at the Teachers College. I had several talks with a Gnanasunderam. Through him I met a very thoughtful Maori who is the director of the Anglican church's educational work in Auckland.

I devoted most of my time in Auckland in gaining insight into the life of Maori and Polynesians in urban areas: a Sunday afternoon dance for young people organized by Pat Hohepa, chairman of the Auckland District Maori Council, conversation in the home of Manitete Fanoti, head of the Samoan Progressive Association, visits to a primary school with a high proportion of Polynesian children, to a Play Centre run primarily by Maori mothers, and to the Orakei Centre where Maori are trying to develop a communal life in an urban setting. I accompanied a delegation of concerned community leaders to confer with a principal who had expelled some Maori students. I especially value the time I spent with students: two evenings with Maori and Polynesian university students, a delightful session with Polynesian high school students, a visit to the Queen Victoria School, a session with seminarians at the St. Paul Theological Seminary and an evening with some African students. I was in homes of Maori or racially mixed families on many occasions.

FINDINGS AND OBSERVATIONS

1. Most Pakeha (as white New Zealanders are called) and many Maori, too - if I can believe a most voluble Maori taxi driver in Auckland - are firmly convinced that their country has no race problem. They believe that the outright bigot would not be encouraged and point to the mixed marriages and to the absence of the usual visible trappings of a racist society (although I was told that discrimination in public accommodations existed as recently as 10-15 years ago in some parts of the country).

The egalitarian nature of New Zealand's welfare state, which has established a basic economic floor for all citizens,

extensive state housing (Maori families are "pepper potted" to discourage racial concentrations in housing!) and the lack of unemployment would seem to describe a society which is more interested in a decent standard of living for all than in privilege for a few. Pakeha are quick to brag about "our Maori," the cultural uniqueness they give to the nation and the preferred status which Maori have. There are special scholarships; earmarked government funds are available for housing loans for Maori; Maori have four guaranteed seats in Parliament, etc. Even some of the social scientists whom I interviewed stated that a racial problem is more potential that actual and preferred to talk in terms of cultural or class differences rather than race. Others stated that prejudice exists in New Zealand but "has a different flavor."

Whether New Zealand merited in the past her reputation as a paradise of race relations, recent developments portend a situation which could become critical, if not explosive. The question is, therefore, whether this country which her own citizens admit is very complacent and conformist, will be able to cope with the demands of the new era in race relations.

2. For a country as sports-loving as New Zealand is, it is not surprising that its watershed in race relations may have come with the departure of the All Blacks, New Zealand's rugby team, for a South African tour in spite of heavy opposition from students, churchmen, civil rights types, Maori, etc. Ten years ago the All Blacks went to South Africa without any Maori players, bowing to apartheid requirements and arousing a storm of disapproval from many citizens who vowed, "never again!" Undoubtedly, the rugby promoters thought that a clash between football-lovers and apartheid-haters would be averted when South Africa agreed to accept the team in 1970 with Maori players as "temporary" or "honorary" whites.

The controversy was hot; efforts were made up until the last minute to keep the team from leaving, including pressure on the Government to intervene and demonstrations at the airport on the morning of the departure. The heat and bitterness of the public discussion, the divisiveness it reflected and the kinds of arguments used by both sides have implications far beyond the sports issue.

Raising the basic issue, whether New Zealanders are really racist at heart, one magazine queried: "Why, in a society which prides itself on its race relations are there apparently so many people who cannot or will not see the basic injustice of racial policies in southern Africa?" The friendship, family ties and similar life styles which white farmers, businessmen and Government officials

in New Zealand share with South Africans and Rhodesians have been brought into the open by this controversy. New Zealanders lobbied unsuccessfully to persuade the International Olympic Committee to let South Africa compete at the next Olympic Games. Coming at a time when New Zealand needs good relations with nonwhite members of the Commonwealth as well as with her Pacific Asian neighbors, her insensitivity to the seriousness of the apartheid issue and the naivete of the proposition that good will toward South Africa and the sending of a multiracial team might serve to modify apartheid have justified anxiety. A comment by an African sportsman that, "New Zealand stinks" got inch-high black headlines in a local paper while I was there.

Maori were split about whether the tour should be cancelled. Some leaders felt the team should go because they had given their word; the earlier condition for going to South Africa had been the acceptance of Maori players. Some reacted against the nature of the protest. The vice-president of the N.Z. Maori Council, for instance, in a long letter to a local paper complained "more in sorrow than in anger" about the wearing of black arm bands because "It is an 'ohia' or ill omen to trifle with the tapu of death." He then went on to suggest that the appropriate manner of expressing resentment would be "to compose a 'Kai-oraora' chant ... an abusive song in which the composer gives vent in poetic language to his ... strong feelings, amounting to hate in some instances." Putting himself in favor of the tour with a plea for expressions of goodwill to the departing players, weakened his appeal to Maoritanga. The unwillingness of certain traditional Maori leaders and government employees to come out clearly against the tour, their ambivalence and some of the arguments they used have cost them support from Maori activists. If Pakeha sympathy (or ambivalence) toward apartheid means that white citizens are drifting psychologically into tougher racial attitudes, this will undoubtedly radicalize more Maori, especially youth.

3. The controversy over the tour which would not in itself force a major racial confrontation - such protests tend to leave the losers in a state of exhaustion and disarray - is significant for the question it raises about the ability of the Pakeha to cope with the racial implications of recent demographic changes. The famous Hunn Report comments on the good old days when the races "got along nicely, naturally and separately." It was generally accepted by both Pakeha and Maori that the cultivation of the land and a rural way of life were "good for the Maori" - a philosophy which was undergirded by government programs, such as the Native Land Development Scheme and by education which stressed agriculture and homemaking but not academic studies. The inadequacy of the

land development program to accommodate a growing population resulted in surplus labor in the rural areas. Unemployment, underemployment and the attraction of urban life, led to an increase of Maori in urban areas from 9.3% in 1936 to 28.7% in 1961. Projecting a total Maori population of 250,000 by 1973, Hunn estimated that half of the Maori would then be in urban areas.

The implications can be understood only when one understands that: (1) Maori population is increasing probably faster than any other in the world; (2) it is a very youthful population; half its members are under 15; (3) Maori have a smaller family income for larger size families and lower educational attainment. It is hard to get precise figures on the total Maori population because of differences of opinion concerning who is Maori for statistical purposes. There are probably around 200,000 Maori now with predictions going as high as 750,000 by the end of the century. By that time, Auckland, which is already the largest Polynesian city in the world, may well have a majority non-white population, for the influx of Pacific Islanders is also increasing while white Europeans immigration is tapering off.

All of the ingredients for the development of a brown underclass are present. It looks as if New Zealand will not be able to avoid the problems which other countries have faced in the urbanization of a racial minority with lower socio-economic status. Maori and Pacific Islanders have already complained about the exploitation they suffer from unscrupulous landlords. If New Zealand's international economic situation becomes more precarious, resulting domestic unemployment, even if temporary, could be disastrous for race relations. The first to feel the impact of a recession would be nonwhite youth who are already expressing their restlessness and alienation.

Youth gangs have already been formed in Auckland. Composed of Maori and Pacific Islanders, calling themselves "Storm Troopers," "Nigs," "Hells Angels" and "Highway 61," - sometimes united behind Black Power slogans and sporting big boots, fancy hats, earrings - these are the first generation of rootless, urban-born nonwhites. The existence of these gangs, largely formed of young people who have been expelled from or have dropped out of school, is an indication of the unpreparedness of the Pakeha to adapt their institutions to a changing community. Jack Shallcrass, an educator, has stated very perceptively, "They are no longer 'our Maoris' - quaint, though equal of course - but almost neighbors, whose behavior is often disturbingly different."

The implications are clear: cities will increasingly be made up of young people who do not understand the rules of the game (especially when they are not explicit) or who will challenge them and want to write their own. This is already being seen in the problems which Pacific Islanders and Maori have with the police in the urban areas and the growing disquiet about the unjustified arrests of nonwhites.

It is also important to note that New Zealand's white population is not so homogeneous as is generally thought. I was surprised to find settlements of Yugoslavs.

4. The 1966 census revealed a median Maori family income of $1871 in comparison with $2191 for Pakeha. This figure does not express the full gap, for the Maori income was providing for 5.2 children in comparison to 2.4 in the white family. Most Pakeha do not believe that this disparity reflects job discrimination. The union leaders with whom I conferred admitted that they have no program for attempting to prevent the development of a brown urban proletariat, but insisted that individual Maori would have no trouble making it if they worked hard and that the apprenticeship doors were open for qualified youth. With the exception of some hostels for apprentices, I heard very little of government programs to meet the needs of out-of-school nonwhite youth. Furthermore, the more I inquired, the more I heard of examples of job discrimination which would certainly be a deterrent to ambition.

I met a Maori civil engineer, educated at Cambridge and with previous experience in Britain, Zurich, at the Aswan Dam and even in South Africa (where he lived, unbelievably in a white area), who decided to return to New Zealand so his children could be closer to their Maori roots. For the first time in his professional life he encountered discrimination in employment. Convinced that he cannot get the level of responsibility for which he is qualified and to which he had been accustomed, he has decided to leave the country.

An experienced Maori educator, with the top credentials in his area, told me he is sure he would not get a certain appointment for which he is qualified. An Indian woman born in Australia spoke with great bitterness about the difficulty her Fijian husband has had in getting emeployment to meet his qualifications.

On the basis of my interviews, I am convinced that a study of nonwhites in top jobs in public or private life would reveal how shockingly small the number is, especially for a county which prides

herself on the excellence of her race relations! There are undoubtedly a number of Maori in middle level positions; most however are in unskilled, semi-skilled and the lowest professional and technical jobs. An editorial in an Auckland paper during my visit commenting on the appointment of New Zealand's first Maori magistrate (this was considered to be news!) went on to state that there is not a single Maori probation officer - a fact which "makes a Maori who has had to accept a European form of justice . . . bewildered, resentful and unlikely to cooperate."

5. In a multi-racial society the government's educational policies and practices reflect the majority's attitudes toward racial minorities. In his excellent M.A. thesis last year, "Planning, Policy and Practice in Maori Education 1936-68," Peter D. K. Ramsay, following Myrdal's concept of the "spiral of cumulative causation," states that the Maori were forced downward into a depressed socio-economic class into which they were firmly entrenched by the early 50's. He describes the contributing role of official educational policy and neglect: poor facilities and teaching in the rural Maori schools; lack of appreciation of Maori culture; severe limits on opportunities for an academic education and failure to take cognizance of the demographic shift. The special Maori schools (these were not completely segregated; Pakeha in the area would attend them) were phased out following a recommendation of the National Commission on Maori Education in 1954. It is important to remember that many of the problems of the urban Maori today grow out of failure of earlier educational policies.

There is now tremendous concern about the failure of the schools in the urban areas. Many of these problems center around the inability of Pakeha teachers to handle multi-racial student bodies and the irrelevance of the curriculum to the needs of Polynesian. I was told that 70% of the nonwhite children opt out of school for, as James Ritchie has written, it is in the school that the Maori "sees the system working toward his exclusion." In 1967, 81.3% of the 4000 Maori school leavers left without a certificate. In addition there has been an increase in the past 3 years in the number of Maori who are expelled from school. A principal who had just expelled some students was quite startled when I queried him about whether a student has any due process rights when he is expelled. Apparently, principals have broad discretion in expelling students and terminate a disproportionate number of Polynesians who then either drop out completely or become part of a floating group of youth who go from one school to another trying to get admitted.

In Auckland in September 1967, 1/6 or 15,000 of the pupils were nonwhite. Some schools have fewer than 1% nonwhite while others have a majority of Polynesian children, as many as 70-90%. Some are trying to make this a positive intercultural experience. One of the pleasantest experiences I had was with the Polynesian Club of Hilary College, a secondary school which has 70% Polynesian pupils. One of the hotly debated issues is language. I was told that the major

educational error was the forbidding of the speaking of Maori on school grounds from 1876-1932; Maori who did so were punished. When I asked the Minister of Maori Affairs whether his department was promoting the development of the Maori language and Maori studies, his answer was negative. He went on to say he looked forward to the time when "we would all be just New Zealanders" - apparently, his concept of integration does not include this aspect of the preservation of ethnic heritage to which Maori give such high priority now. A Swiss principal of what is regarded as a model primary school (he has a large number of low-income nonwhite children and feeds them lunch - the one place where I found a school lunch program in New Zealand!) was also against introducing Maori language. He had too many other things to do. Maori may have a hard selling job to do even on liberal whites who concede that it was wrong to eliminate Maori language but who now believe it is too late to foster it.

A major need is for teachers and curriculum materials for multi-racial schools. There is a widespread feeling that the teacher training institutions are not doing an adequate job. I was glad to visit a seminar on teaching in a multi-racial classroom and to receive a copy of an excellent mimeographed primer, "Some Suggestions for Teachers of Maori Pupils" prepared by an ad hoc group convened at Auckland Teachers College and composed primarily of Maori contributors. One chapter on "The Strengths of Maori Children" is particularly good for it helps the Pakeha teacher get away from the idea that the different child as a problem. Sesame Street was previewed while I was in Auckland and well received.

One of the major crises facing Maori education now concerns the church-sponsored, residential private schools. Founded by missionaries, they taught in the vernacular from the beginning and have prided themselves on their bilingual, bicultural graduates, many of whom have become leaders. They are now bankrupt; but because of the church-state issue, do not want to become dependent on government support.

New Zealand has the largest pre-school movement in the world. Play Centres and Family Play Groups are completely run and dominated by parents. The centres are linked together in an association, follow certain procedures have specified requirements for training and equipment and receive a modest government subsidy. Family Play Groups are smaller and more informal but in both cases there is indigenous control and considerable interest among Maori because there is the feeling that in these centres "Maori destinies are more confidently in Maori hands as a basis for an integrated society." USA's Headstart Program has been closely followed in New Zealand but not always with approval. I read in one article, "One would wish to avoid the experience of a 'Headstart' programme, massively conceived and generously endowed yet essentially paternalistic, sociologically unsubtle and doomed to anti-climax, and even failure."(!)

A working party of the Maori Adult Education Committee

whom I met are presently conducting a survey of adults and out-of school youth over 15 to determine their interest in: second chance education, advanced academic courses, arts and crafts, carving, leadership training for voluntary organizations, etc. Members of the Tuuhoe tribe have arranged seminars in Auckland on "Te Kawa o te Marae" (marae etiquette and the format of formal speech making).

Funds from Maori trusts are often used for educational purposes. The Maori Education Fund, a quasi-government agency which has a capital fund from Maori lands and trusts, the interest of which it can use along with direct government grants, provides money for scholarships, pre-school programs and research.

6. Millions of acres of Maori land were alienated by white settlers in the last century. What happened from then until 1967 when Parliament passed what Maori bitterly call the "Last Land Grab Act" is impossible to comprehend on a short visit. (I am glad that the Church and Society Commission is planning to sponsor a seminar on the land issue). So, instead of trying to absorb a century of very complicated history and to understand the legal issues, I decided to focus my questions on how Maori, especially urban Maori, feel about the land.

Maori harbor deep resentment that their lands were taken, large areas of which were confiscated, and point out that even though half of it was returned, most of this has ended up in Pakeha hands. Maori were pushed onto marginal land. Later commissions declared that the confiscations were wrong, but the injustice was never corrected. Compensation which was paid was only token.

Maori are incensed that the 1967 Act could have been passed over strong opposition and are not quieted by statements that the version of the Act which was passed had some of the objectionable features removed and that parts of the Act are not being implemented anyway. The government has done little to clear up the confusion over this Act. What is clear to Maori is that it reconciles Maori land use into Pakeha patterns, accelerates the alienation of the land and is discriminatory legislation. Uneconomic or unproductive Maori land can be taken. The authority to bring idle land under production does not, however, apply to Pakeha although the bulk of unproductive land is owned by them.

Douglas Sinclair, an Auckland University professor who is an authority on land has written that, "The Maori Trustee has now reverted to his former infamous character of Maori Land Purchase Officer, and he is back working for his old firm, the European farming community and their lackeys, the county councils."

The land issue is clearly the symbol of unjust acts against a people and will continue to be a hot political question until it is resolved with equity. It is when one asks individual Maoris what the land means to them personally that one gets quite different answers. For some urban Maori the possession of land is regarded in the full traditional meaning of Turangewaewae, "a standing place for

the feet," giving every man and woman his direction and dignity and a right to speak and participate as a responsible member of Maori community. Others are only concerned about how the land can work for them - land is a source of cash for education and personal advancement. For still others land should be the base for the economic development of the Maori community with land development under Maori control and not the government.

The involvement of the churches in the alienation of land should be investigated. I found considerable concern among churchmen about the role of the Anglican Church, for example. Most of the land owned by the Anglican Church in the Auckland area is controlled by the Melanesian Mission Trust and the St. Johns College Trust. How the land was originally acquired, the accountability of the trust boards to the Church, and the possibility of broadening the interpretation of the mandate of these trusts should be studied with the objective of using these funds for Maori development programs and also returning land to Maori control.

7. "The closer we get, the more we're taking a damn close look!" The message in these words to me by a Maori civil servant was repeated all over the country. I was amazed at the soul-searching and the depth of bitterness which I encountered in Maori who had impressed me as being highly assimilated. For many Maori the search for identity is clearly a painful process for it may involve the re-evaluation of close relationships with Pakeha, including spouses. In others, one senses a feeling of release from the "white man's bag," the joy of fresh discovery of a heritage which can be recreated in a new setting.

Many Maori now feel that they gave up too much, gave in too easily and permitted the Pakeha to develop an ethos of racial harmony without challenge. They now want to set the record straight. A Maori labor leader described New Zealand as a racist society overlaid with paternalism. Young people spoke with deep resentment of being made to feel inferior and of the self-hatred and insecurity they have developed. "Whakama" -shyness and withdrawal- has often been the Maori response to contact with Pakeha arrogance. Maori describe the Pakeha attitude toward Maori customs as a mixture of tolerance, amusement and irritation - but seldom respect, except when Pakeha want to parade Maori before foreign visitors. I vividly recall the strong negative outburst when I asked a Maori student whether his Pakeha roommate would understand tangi (the traditional observances at the time of death). Many Maori believe that the change from the earlier official policy of assimilation to the present one of integration does not reflect any shift in Pakeha toward a two-way, genuinely bicultural society. Maori are still expected to do all the adjusting.

One young Maori bitterly commented that he will have no more of the Pakeha ranking system - "our Maori are the noblest of the coloured races, not niggers!" for he feels a closeness to his black brothers in Africa and the USA.

Persons who exploit others usually silence their consciences by attributing to the oppressed the blame for their own conditions. Maori are increasingly refusing to accept the blame for lower academic and economic achievement, higher crime statistics, etc., and are documenting how Pakeha, acting as private citizens and as implementers of official public policy, have contributed to the Maori's problems.

I spoke to Maori or Polynesian student groups only on the condition that they would let me question them. I usually opened up by asking what it means to them to be Maori in white New Zealand. I wish I had had a tape recorder because I often felt that for some of them this was the first time they had discussed this question in public and that they were surprised at what they found themselves, or their few Pakeha collegues, saying. A high school lad asked me whether American blacks want to be white after integration! There was an upsurge of emotional response when I told him - and other student groups - that 350 years after having been torn from ancestral lands, roots and language, blacks - even bourgeois blacks who have made it in the system - are convinced they do not want to die as a cultural group and that the search for identity is as important to us as the struggle for civil rights.

Maori are not only taking a close look at their relations with Pakeha; they are looking at their own heritage particularly to see whether their traditions which have rural roots can be transplanted and made to thrive in an urban environment. There have been efforts by urban Maori to establish the marae, the land in front of the meeting house where ceremonial greetings, speech-making and discussion of community issues take place. I was really moved when I visited Maori homes where the host welcomed me in Maori with the traditional greeting to the stranger, stating that his urban dwelling was his marae.

Young people are embarrassed when they cannot speak Maori and are putting pressure on adults to set up classes. In some cases this is causing a break with assimilated parents! One young woman, first generation urban-born spoke of her parents' consternation - for this they sacrificed themselves - that she intends to reestablish roots with rural relatives, is studying Maori and intends to bring up her children as Maori. The action songs (which really only go back to World War I and which often have Western tunes) and haka (traditional war dances) are highly popular and are used as a cultural rallying point for rootless urban youth. Canon Wi Huata in Hamilton states frankly that he sees his mission as a clergyman as promoting cultural rivival and solidarity.

Maori are evaluating the relevance to the urban situation of special Maori institutions created by government for an earlier era. Since 1868 there has been a special Maori electorate with four seats guaranteed in the Parliament. I found no consensus on whether this electorate should be continued. Some persons, like Mrs. Whetu Tirakatene-Sullivan, M.P. for the Southern Maori Electorate, are

very bitter because the Labour Party to which most Maori belong has never put a Maori up for a safe seat. She would favor increasing the number of Maori seats (the number has never changed in the century) to reflect the growing population. Other Maori feel that the electorate should be abolished and that Maori should participate in the mainstream political process and not be the captive of any party.

The Maori Welfare Act of 1962 created a complicated structure of local welfare committees and district councils which ultimately elect the New Zealand Maori Council. NZMC has been challenged for being unrepresentative and conservative but I gather there is more interest in reforming it rather than abolishing it. Dr. Pat Hohepa (University of Indiana and Massachusetts Institute of Technology and a specialist in linguistics at Auckland University) was recently elected chairman of the Auckland District Council and will undoubtly bring in fresh ideas. For example, he wants to have the youth gangs represented on the Council.

This same Act created the Maori wardens, apparently, out of concern about public drunkenness, "to assist in stamping out mischief before it becomes crime and the maintenance of law and order." Wardens are appointed by the Minister of Maori Affairs but serve without pay and buy their own uniforms. An institution which grew up with considerable community support in the rural areas, it is now causing resentment in cities particularly by youth who feel that the wardens have arrogated too much power to themselves and identify too closely with the police. They still focus on liquor, monitor the bars and can get a prohibition order from a magistrate which, if not challenged, could prevent a Maori from drinking. I was surprised to find that many of my most liberal Maori friends want to reform but not abolish the warden system and were quite surprised when I told them we would fight it as unconstitutional in the USA since wardens usually exercise their authority only over Maori.

Many deeply concerned Maori work for the government and are increasingly frustrated because they feel a conflict between their official instructions and their need to respond to their community's needs. One very highly placed Maori admitted to me with great sadness that he is often troubled because he is involved in the perpetuation of colonialism! Maori working for the universities feel freer but completely Maori-controlled agencies which could employ some of the very able men and women I met would certainly be an asset during the critical years ahead.

8. New Zealand's immigration policies have been challenged by CARE and other groups as being "predicated on the false concept of the inherent superiority of the white race." As I entered the country, I noted the kind of racial and other data requested from Pacific Islanders. Islanders from the Cook Islands, Niue and Tokelau are New Zealanders and apparently move in and out freely. Citizens of Fiji, Tonga and Samoa have major problems. A Samoan may only enter on a 3-month permit during which time he must get housing and

a job guaranteed. He must then return to Samoa to reapply for a longer permit. The Indian woman of Australian citizenship is sure she is treated differently from white Australians.

I found difference of opinion about tensions between Maori and Pacific Islanders. My Auckland taxi driver sounded off with great bitterness against the Samoans, reciting all the traditional stereotypes against them, and added the comment that they have had no contact with other people but have just stayed home "practicing incest!" At the Auckland University Maori Club when I asked their opinions, the most articulate Maori students vowed there is no problem because "we are all Polynesians alike" but sank into silence when a young Tahitian spoke with deep feeling about his sense of being excluded as a non-Maori who had no land to stand on. A lovely high school girl from Tonga whom I met at Hilary College told me about the problems she had as a child but she is obviously a student leader now and one of the key performers during the action songs. The Polynesian Club there is genuinely international; the students performed a Samoan war dance in addition to the Maori action songs. As I mentioned earlier, the integration of Pacific Islanders and Maori into the gangs seems to present no problem.

I was told that Pacific Islanders do most of the unskilled work in hospitals.

Some New Zealanders, both Pakeha and Maori, feel that the churches foster divisiveness by maintaining separate national missions. The Samoan Congregational Church was singled out for this criticism on several occasions.

RECOMMENDATIONS

1. Every effort should be made to counter New Zealand's isolation and to bring her concerned citizens into closer fellowship with people all over the world who are working to eradicate white racism. Specifically:

a. New Zealanders with special concerns, such as the urbanization of racial minorities, should be enabled to visit other countries where innovative projects have been developed.

b. The exchange of specialists should be promoted. I would particularly recommend arranging for:

(1) An American black social scientist to spend a term in New Zealand to be divided among the key

universities; he or she could also give a few public lectures, and perhaps a series of talks on television, write articles for the press, etc.

(2) An American black civil rights lawyer to confer with key lawyers in New Zealand; I found great interest in the affirmative role of the lawyer as an advocate but little comprehension about how this could be done within the New Zealand legal tradition.

c. Publications of public and private agencies such as the U.S. Commission on Civil Rights, the Institute of the Black World and the Southern Regional Council should be sent in; also documentaries, studies, reports of hearings on such issues as: land, Indian rights, bilingual and multicultural education, preschool programs, black consciousness, etc.

2. Because of the urgency of the land issue, the World Council of Churches should:

a. Set aside 25% of its special racial justice fund to use for this purpose;

b. Convene an international consultation on land rights to put people who are working on this issue in touch with each other. To be invited: Australian Aborigines, Maori, USA Indians, Spanish-Americans and Alaskans, Canadian Indians and Eskimos, South American Indians, lawyers, representatives of U.N. agencies, etc.

c. Support the New Zealand Council of Churches if it develops an ecumenical project on land rights.

3. High priority should be given to the political organization of urban Maori and Polynesians. Purpose would be: to advise people of their rights; to develop a platform and an agenda of priorities on such issues as land, jobs, education, language, criminal justice, the Maori electorate, etc.; to sponsor voter registration and to run candidates accountable to the people. I do not think that questions such as the future of the Maori electorate can be decided until a grass roots political organization has been created which can make its own decision. If such a movement emerges, I would strongly recommend financial support from the World Council of Churches.

4. Assistance should be provided to the New Zealand Race Relations Council as it thinks through its role and develops its structure. Workable models from other parts of the world should be suggested. The present leadership is quite aware that it may face the same challenges which liberal-white dominated civil rights organizations have met elsewhere: it may be too late to involve the

articulate, militant Maori. However, there is an important job for the Council to do right now in documenting the facts of white racism, providing a national platform for Maori and Pacific Islanders to "tell it like it is" sponsoring an interracial, broad-based forum for hammering out public policies to guarantee racial justice and in developing the needed support among the Pakeha for these policies. NZRRC could provide a useful service immediately by publishing a brochure on what a citizen's civil rights are (I shall never forget the student who blurted out that he has been studying law for two years and doesn't know what his rights are!) and how they can be secured.

5. Foundation support from the USA or Europe should be found for the Centre for Maori Studies and Research which has been proposed for the University of Waikato. If basic support for the total program cannot be found, perhaps the Centre could be encouraged to develop an international division which would receive outside financing and which would be devoted to: developing a clearinghouse of information on race relations all over the world; facilitating and hosting international exchanges of specialists in race relations; providing technical assistance to groups working in a wide variety of fields to promote racial justice in the South Pacific (e.g. James Ritchie is already working on a culture-free tests).

Dear friends, if you are still with me, I hope you have caught my enthusiasm for my trip. The experience was exhilarating and exhausting (I slept all the way from Auckland to Philadelphia)! To the extent that my insights are valid, it is because new friends opened their minds, hearts and homes to me, suffered my endless questions and changed schedules to accommodate my insatiable curiosity. My last host took to his bed in a state of post-Fairfax collapse!

Now I want to do my part to forge closer links of understanding and common endeavor between individuals and organizations working for the eradication of racism in New Zealand, Australia and the USA. I am eager for your reactions to my recommendations and for specific suggestions concerning how they can be implemented.

Sincerely,

Jean

Miss Jean Fairfax
Legal Defense & Educational Fund, Inc.
10 Columbus Circle
New York, New York 10039

Dear Jean:

I am sorry that there was not more time for us to talk when you were in the office recently. Several of the ideas raised in your meeting with us and Winifred should be pursued. I think that several of us should talk about what our roles can be in helping prevent or to constructively meet crisis situations. Certainly, also, several of us could work on the problem of appropriate expose articles.

Regarding a conference which would involve the lawyers and provide a current realistic grasp of some of the problems, I believe we could be of substantial assistance. The kind of detailed experiences that Leon and others could relate, the reports, and some very impressive tapes could all be utilized. We would be quite hesitant, as we indicated, to actually call in many students for firsthand recitals.

Would you be able to make an Employment Discrimination Strategy seminar on April 24-25? You will recall that I raised this with you but you did not have an opportunity to respond to the proposed date.

Best personal wishes.

Sincerely,

Emory F. Via, Director
Resources Development Center

RE: SPECIAL CALL MEETING ON NAIRO'S FUTURE
OCTOBER 7, 1970, 12:00 NOON

You received inthe mail recently, a special campaign news bulletin dated September 23, 1970, indicating, in clear and specific terms, the dilemma which faces our professional organization.

We in Atlanta must make a decision for our chapter's future as well as the future of NAIRO.

This memo comes to request your participation in this most important meeting.

PLACE: 136 Marietta St., N. W.
Suite 235

DATE: Wednesday, October 7, 1970

TIME: 12:00 NOON

Please plan to come.

SPECIAL CAMPAIGN NEWS BULLETIN
September 23, 1970

NATIONAL ASSOCIATION OF INTERGROUP RELATIONS OFFICIALS
2027 MASSACHUSETTS AVENUE, N.W. • WASHINGTON, D.C. 20036 • 387-7050
EDWARD HOWDEN, PRESIDENT

A LETTER TO NAIRO MEMBERS AND FRIENDS
-- from the Chairman of the NAIRO Recruitment, Re-enrollment and Funding Campaign

Enclosed is a brochure which states the rationale and objectives of the 1970 NAIRO Campaign. Please take time to read it now, before you continue reading this bulletin....

Now that you have read about the Campaign, I hope you are looking through the folds of this bulletin and the brochure for a pledge card and return envelope.

But you won't find one. This is an important matter, so we aren't casually mailing out pledge cards.

Instead, we have organized the Campaign to give you an opportunity to talk to a colleague -- or, in some few cases, at least to correspond with one -- about the question of building a professional association in general and NAIRO in particular. That local colleague will ask for your pledge in person.

One reason for doing this the hard way is that we think you might have some questions, some doubts, some criticisms, some ideas; and, frankly, we figure the odds are against your signing a pledge until you've had a chance to voice and discuss your own thoughts and ideas about NAIRO.

More importantly, raising money isn't the only objective of the Campaign. Underwriting a realistic budget is only a necessary step toward building a useful Association. So we want to raise the money in a way that involves some associating. We want you to share your questions, your doubts, your criticisms, your ideas with us, your colleagues, as a part of that process of building. So we aim to get these responses from you, even if you don't make a pledge. "Will you give?" is only one of the questions to which we need your answers.

Of course, if too many withhold financial support, there won't be a chance for the in-kind contributions to bear fruit.

I admit that this is a strange campaign. At this point, were this a standard financial effort, this bulletin should be full of glowing reports of going chapters, growing enthusiasm, and glowing prospects of success. But I'll hand you no such flapdoodle. The fact is, I've no idea whether the effort will attain its monetary goal or not. (It can, but will is another matter.) Here is where we are now and what is supposed to happen:

-- 36 Board members have pledged $4,184.00. That's not bad. So far, only those in the "leadership list" have been solicited.

-- In each of the ten regions the NAIRO regional chairman is cooperating by beginning prospect lists for each chapter or area and enlisting local campaign chairmen. These regional chairmen are J. Griffin Crump (Great Lakes), James F. Sanders, Jr. (Mid-Atlantic), Hollis B. Bach (Mountain States), Mrs. Nelson Rostow (Northeast), Ellis Harris Casson (Pacific), William E. Knox (Plains States), Robert E. Hughes (Southeast), J. Edwin Stanfield (Southwest), William P. Condo (Upper Atlantic) and Thomas Ebendorf (Upper South).

-- All necessary campaign materials are ready.

-- Local campaign organization is to be completed by the end of September.

-- Solicitations are to be completed by October 16th. Someone will be in touch with you by then, to seek your participation.

-- Results will be relayed through the regional chairmen to the NAIRO office and a report will be released at the start of the Annual Conference in Tulsa, October 26th.

-- By the end of the Annual Conference we will know whether the Campaign has succeeded or failed to reach the minimum $50,000 in pledges. Your pledge will be activated only if that much or more has been promised by that time.

By conducting this campaign we are simply asking these questions:

Do you need a professional association?

If so, do you have a modicum of time and a fair share of money to invest in one?

If so, will you give NAIRO a reasonable chance to become a good one?

We know you will come to a reasoned decision, so we aren't going the high-pressured propaganda route. The questions are before you and we await your answers with interest.

-- Edwin Stanfield, Chairman
NAIRO Campaign

CAMPAIGN PLAN

1970 NAIRO RECRUITMENT AND FUNDING CAMPAIGN

Introductory Comment

NAIRO's Board of Directors, meeting in Chicago, June 26-27, 1970, authorized a recruitment and funding campaign aimed at securing at least 1,000 members and pledged support averaging $5.00 per month from each of them by the end of our Annual Conference in Tulsa, October 26-30. In the campaign, members and potential members of NAIRO will be asked to commit themselves to make a monthly (or quarterly) donation to NAIRO during the period of October, 1970, through December, 1971. Payment of any pledge of $3.00 per month or more will be taken in lieu of the member's next annual dues. These pledges will be activated provided at least $50,000 is thus pledged for the 15-month period. If fully successful, the campaign would mean an income of $75,000, over the 15-month period for NAIRO, from its membership alone.

Here are some of the elements of the Board's thinking:

(1) If NAIRO is to be an effective Association, some means must first be found to provide its basic operating income. Much is needed in the way of increased staff, greater efficiency, improvement of services and programs. But it is meaningless to discuss these things until a minimally adequate income is secured.

(2) As a professional association of workers in the field of human rights, human resources, and intergroup relations, NAIRO should look to its own constituency for basic income. The Association cannot rightly expect foundations or other outside sources to support it, except for special projects, such as the NAIRO Intern Program which was conducted a few years ago.

(3) The Campaign must be considered as the first step toward reconstitution of NAIRO. The Board was well aware that NAIRO cannot appeal to members or potential members on the basis of its past performance. In effect, we shall be asking NAIRO members to "gamble" a realistic level of support for 15 months. The Board believes that, given this minimally adequate level of support, NAIRO can be made both viable and vital by the end of 1971. As noted above, the pledges made will be activated only if pledges totalling at least $50,000 are made -- so that no one need pay anything (except for the Board members who are being asked to make advance pledges beginning in July) unless the over-all response is sufficient to give the Association a realistic chance to reform itself.

(4) $5.00 per month or $60.00 per year from each member is, after all, only reasonable in support of a professional association. Most such associations have dues set at that much or more. By arranging for payment on a monthly or quarterly basis, we should be able to secure this realistic level of support in a way relatively painless to NAIRO members.

One can anticipate several side benefits of such an effort:

(1) If the Campaign Plan is carried out carefully (as it will have to be, if it is to be successful), we are almost certain to increase NAIRO's membership.

(2) Payments to NAIRO on a monthly or quarterly basis will increase interest in the Association and help to sustain it.

(3) Successful execution of the Campaign Plan by local chapters or, where there are no chapters now, by interested individuals, might well result in formation of new chapters and better functioning of the old ones.

(4) Since "he who pays the piper calls the tune," broader, more democratic particpation in the Association's business and activities will likely result if the members are the primary source of support.

A grant from the Alliance for Labor Action enables us to keep the office open and employ an Acting Executive Director until the end of 1970. This gives us a chance to carry out the Campaign. The grant was announced by Mr. Wiley Branton, Director of the Community and Social Action Commission of the ALA, at the Chicago meeting of the NAIRO Board. In transmitting the first installment of the grant, Mr. Branton wrote, "...continued payment of the balance of the grant is conditioned on NAIRO's good faith efforts in seeking additional financial support for its programs."

So it is up to us. We have a chance. We have a plan before us. The Campaign Plan outlined below is designed with the thought in mind that we are all very busy people. So no one person is asked to do too much. It is important, however, that a lot of people do a little bit -- and do it on schedule. If one person procrastinates, everybody down the line is fouled up, and the chances of success are greatly dminished. As someone once said (no telling who), "The secret of success in any undertaking is nothing more or less than doing the parts you don't want to do when you don't want to do them!"

One final word: Beware of shortcuts! Inevitably somebody is going to be tempted to try an easier way -- "Why bother with all of those lists?" or "I'm too busy for appointments -- I'll just telephone the people on my list and get the pledges that way." Each step of the plan is tried-and-true, and experience in countless such campaigns has shown that shortcuts lead to trouble -- or even failure. The plan will succeed -- but only if it is carried out step by step.

-- Edwin Stanfield
Campaign Chairman

Austin, Texas
August 3, 1970

CAMPAIGN SCHEDULE -- STEP BY STEP

Step One

To be taken by: NAIRO Board of Directors
To be completed by: June 27, 1970 (Chicago Board Meeting)

Authorization of Campaign. Adoption of Campaign Plan. Advance pledges by Board members present in evidence of leadership and determined support. (Note: This step has already been taken, of course. Thirteen Board members pledged $1,620 over the 18-month period, july, 1970, through December, 1971.)

Step Two

To be taken by: Campaign Chairman and NAIRO staff
To be completed by: July 18, 1970

Issue Campaign Bulletin No. 1, announcing the Campaign and the results of initial advance pledges by Board members. (Note: This step, also, has been carried out.)

Step Three

To be taken by: NAIRO President, with assistance of staff
To be completed by: August 7, 1970

Letters to Board members not present at Chicago meeting, asking them for advance pledges in support of Campaign. Immediate response requested, so that results can be announced in Campaign Bulletin No. 2.

Step Four

To be taken by: Campaign Chairman and NAIRO Regional Chairmen
To be completed by: August 12, 1970

Detailed Campaign Plan sent by Campaign Chairman to Regional Chairmen. Regional Chairmen should have read plan carefully by the above date and should have called Campaign Chairman, collect (Ed Stanfield -- 512/477-5974 or 512/454-8996), to accept responsibility and discuss any questions.

Step Five

To be taken by: Campaign Chairman and NAIRO staff
To be completed by: August 21, 1970

Issue Campaign Bulletin No. 2, announcing results to date on request for advance pledges from Board members and request for cooperation of Regional Chairmen.

Step Six

To be taken by: NAIRO staff and Regional Chairmen
To be completed by: August 26, 1970

Two (2) sets of 3x5 index cards sent by NAIRO staff to each Regional Chairman, giving name and address of every person in his region who is on NAIRO mailing list. By the above date Regional Chairman should have sorted cards by chapters or, where no chapter exists, by area and should have had duplicate sets of prospect lists for each chapter (or area) typed alphabetically on forms provided.

Step Seven

To be taken by: Regional Chairmen, with Chapter Chairman or Local Campaign Chairman
To be completed by: September 2, 1970

Regional Chairman should have contacted each Chapter Chairman (or an interested individual in areas where there is no active chapter) to explain Campaign and ask him to serve as Local Campaign Chairman. Regional Chairman should have sent list of the names and addresses of Chapter Chairmen or other persons who will serve as Local Campaign Chairmen to NAIRO office. Regional Chairman should have sent to each Local Campaign Chairman one copy of his prospect list and one set of the 3x5 index cards from which the list was compiled.

(Note: Regional Chairman should see to it that every prospect sent to him from NAIRO office is either assigned to a Local Campaign Chairman or that some other provision is made to solicit the prospect's pledge. If at all possible, arrangement should be made for a personal solicitation. Only in the case of a prospect who is so isolated as to make campaign organization quite impractical should an exception be made to this rule -- and then the Regional Chairman or Local Campaign Chairman to whom that prospect is assigned should invest in a long-distance telephone call to reach the prospect at the appropriate time. Charge NAIRO for the call, if you need to. But if there are as many as 5 or 6 prospects in a city or area which has no chapter, it is worthwhile to find a local cahirman and ask him to conduct the campaign. You might form a new NAIRO chapter in the process!)

Step Eight

To be taken by: NAIRO staff, with (national) Campaign Chairman
To be completed by: September 9, 1970

NAIRO staff should have mailed to each Local Campaign Chairman an ample supply of campaign brochures, pledge cards, solicitors' instruction sheets and prospect-list forms, and report forms.

Step Nine

To be taken by: Local Campaign Chairmen
To be completed by: September 14, 1970

Local Campaign Chairman should have enlisted campaign workers (solicitors). It is important that he enlist one worker for each eight (8) prospects on his list, so that no worker will have to call on more than seven prospects. He should take into account geographic distribution of prospects and workers. He should ask all workers to attend a meeting for briefing and assignment of individuals to contact. This meeting should be scheduled for a date not later than September 25, 1970. (The sooner the better.) Workers could be asked, at the time they are enlisted, to think of three or four acquaintances who are not NAIRO members and might be added to the prospect list.

(Note: In the case of some large chapters it may be desirable for the Local Campaign Chairman to secure the aid of others to enlist the necessary number of workers. He might break his chapter's area into sections and ask someone to enlist the required number of workers for each section. If this is to be done, it is an extra step and should be taken as far in advance of the completion date for Step Nine as possible.)

Step Ten

To be taken by: Local Campaign Chairman and Campaign Workers (Solicitors)
To be completed by: September 25, 1970 (sooner, if possible)

Briefing meeting for Campaign workers. Ample time should be allowed for this meeting -- at least two hours of working time. The following things must be done at this meeting:

(1) Briefing and explanation of procedures by Local Campaign Chairman. (A supply of instruction sheets for workers will be provided.)
(2) Potential NAIRO members added to the prospect list as suggested by Campaign workers. A 3x5 card should be made for each new prospect.
(3) Prospects assigned to workers -- preferrably no more than seven to each worker -- by giving 3x5 prospect card to a worker.
(4) Workers make their own pledges and turn them in to Local Campaign Chairman.
(5) Date of final report meeting set.

Immediately after this meeting the Local Campaign Chairman should send to the NAIRO office, via air mail, a report of the total number of workers' pledges received and the total amount pledged for the 15-month period. This is in order that good progress may be reported in Campaign Bulletin No. 3 (Step Eleven).

Step Eleven

To be taken by: NAIRO staff, with Campaign Chairman
To be completed by: September 29, 1970

Issue Campaign Bulletin No. 3, announcing total of pledges to date. Bulletin will be mailed to everyone on NAIRO mailing list, so that (hopefully) good results to date will encourage favorable response to solicitations.

Step Twelve

To be taken by: Campaign Workers
To be completed by: October 16, 1970

SOLICITATION OF PLEDGE FROM EVERY PROSPECT -- BY PERSONAL INTERVIEW.

Step Thirteen

To be taken by: Campaign Workers, Local Campaign Chairman
To be completed by: October 16, 1970 (no later, please)

Final report meeting of workers. Each worker to turn in his report form and pledges obtained. Immediately after this meeting, Local Campaign Chairman compiles chapter (or area) report and air mails it to NAIRO office with all workers' reports and all pledges.

Step Fourteen

To be taken by: NAIRO staff
To be completed by: October 23, 1970

Prepare Campaign Bulletin No. 4, for release at beginning of Annual Conference (October 26, 1970), announcing results of Campaign to date.

Final Note

Some regions and/or chapters may wish to advance the schedule in order to set a good example for the rest of us! Steps Nine, Ten, Twelve, and Thirteen could well be completed early. Those who wish to work faster, after receiving the necessary supplies called for in Step Eight, should do so -- by all means. Early reporting of results will help the Campaign to gather momentum.

SHULTZ COMMENDS BUSINESS ALLIANCE FOR HIRING AND TRAINING THE HARD-CORE UNEMPLOYED

WASHINGTON -- Secretary of Labor George P. Shultz has commended the National Alliance of Businessmen (NAB) for its efforts in hiring and training the hard-core disadvantaged.

"Your success to date deserves the thanks of the Government and the American people," he said. "Your contributions have been impressive."

The goal of the Alliance is to hire and have in training 100,000 of the Nation's most seriously disadvantaged -- the hard-core unemployed -- by June of this year.

The NAB, under the Job Opportunitiesin the Business Sector (JOBS) Program, has hired 145,900 men and women with the most difficult employment problems in 50 American cities and 87,850 of these new workers are still on the job.

Shultz reported that 75 more cities will be added to the JOBS effort, bringing the total to 125. "We will vastly expand our capabilities for serving the severely disadvantaged," Shultz said.

In conjunction with the addition of the 75 cities, the Department of Labor will soon announce a new round of JOBS training contracts to improve services to those most in need of employment assistance.

(MORE)

"The Alliance, in partnership with the Federal Government," Shultz stated, "is playing a strategic part in hiring and training people who were without hope, jobless people without skills, penniless people who could not buy enough clothing, enough food, enough of anything."

Shultz pointed out that "these activities represent a great investment in the future of this Nation."

He said that the average person placed in a productive job will:

-- contribute $10,000 a year to the gross national product.

-- pay about $241 in income taxes in the first year of work.

-- increase purchasing power for goods and services by $3,400.

Shultz said that the recent reorganization of the Labor Department's Manpower Administration will allow the Government to work more efficiently with the JOBS effort in serving the disadvantaged.

He said he looks forward to working with American businessmen "to increase efforts to insure that every citizen has an opportunity to live and work with dignity and economic security."

ATLANTA CONSTITUTION 4-10-1969

Drive to Place Hard Core Jobless Here Is '$100 Million Task'

By ALEX COFFIN

The National Alliance of Businessmen's Atlanta job drive is a $100 million program, Al Bows, NAB's Metropolitan chairman, told the Butler Street YMCA's Hungry Club Forum Wednesday.

Al Bows

Bows said the drive to employ 3,600 of the hard-core jobless and 2,500 unemployed youths will save $40 million in welfare payments and pump another $60 million new money into the economy.

Businessmen will have to come up with one new job for every person now working in the metropolitan area, Bows said.

He said that the Atlanta Jaycees have agreed to try to expand the program into 200 smaller businesses this year.

Bows said he is highly encouraged about the program—mainly because of the response so far from the firms involved last year.

He said interested persons should ask the various Economic Opportunity Atlanta neighborhood centers or the Georgia Employment Service to connect them with the jobs being promised by local businesses.

New elements of the program this year, Bows said, will be added emphasis on employing women and hopefully greater cooperation by labor unions. Better transportation and more day-care centers are problems confronting the program, he said.

He called on his audience to encourage the hard-core unemployed to try once more—because of changing attitudes by Atlanta businessmen—and not be discouraged if everything's not perfect. "Believe it or not, businessmen are human and therefore make mistakes," he said.

The former Atlanta Chamber of Commerce president said he thinks local businessmen are eliminating the prejudices and misunderstandings that have existed in the past and which have thwarted Negroes' efforts for employment and advancement.

WALL STREET JOURNAL MAY 23 1969

Minority-Group Store Workers Set Union; AFL-CIO Dissidents to Align With Reuther

By JAMES P. GANNON
Staff Reporter of THE WALL STREET JOURNAL

WASHINGTON — A new, national "catch-all" union, aligned with Walter Reuther's Alliance for Labor Action, will be formed this weekend.

The new union, comprised of segments of the Retail, Wholesale and Department Store Union that have broken away from their AFL-CIO parent body, will take shape at a weekend conference in Suffolk, Va. Planners of the organization claim it will be the first major union with a membership predominantly of minority groups; a black man is expected to be named to its top office.

Tentative plans for the union, to be called the National Council of Wholesale, Retail, Office and Processing Workers of America, were disclosed by sources in the former District 65 segment of the AFL-CIO Retail-Wholesale Union. The New York-based District 65, with about 30,000 members, will be the nucleus of the union, which, organizers claim, will have an initial membership of about 45,000 members.

Some 15 other locals that have broken away from the AFL-CIO Retail-Wholesale union also will be charter members of the National Council. They include locals from Suffolk; Newport News, Va.; Charleston, S.C.; Charlotte, N.C.; Detroit; Memphis; Newark, N.J.; Jersey City; Los Angeles; Tallahassee and Jacksonville, Fla., and other cities. District 65 is heavily Negro and Puerto Rican. The locals have predominantly black membership.

The new union will receive money and organizing manpower from Mr. Reuther's United Auto Workers and the Teamsters Union, which joined in forming the Alliance for Labor Action, a rival to the AFL-CIO. The alliance plans to hold its first national conference in Washington next Monday and Tuesday.

The new union won't be formally affiliated with the ALA, at least at first, but will be closely allied to the UAW-Teamster partnership. District 65 already has received $120,000 from the UAW to expand organizing, and both the UAW and the Teamsters have pledged to make staff organizers available for the National Council's membership campaign.

The National Council will aim its organizing primarily at low-wage workers, especially Negroes, Mexican-Americans, Puerto Ricans and other minority groups. Planners envision a broad jurisdiction unhampered by industry or craft lines. "We're a catch-all," said one. The new union's leaders are mapping an ambitious campaign in 50 cities, and aim at doubling their membership in a year.

Plans for the union are subject to approval of delegates from the charter locals at the weekend conference in Suffolk, but no substantial change in the tentative outline is expected. Delegates also will elect officers, with the likelihood of naming minority-group members to the highest posts. The top office, either chairman or president, is expected to go to a Negro; Cleveland Robinson, secretary-treasurer of District 65, is a likely choice.

Buddy System For Unemployed Expands in 1969

BY JIM CURRAN
Chronicle Reporter

Harry Lentor is 30 years old, married, with four children, and he's never had a steady job in his life.

Harry has had jobs, a day's work here, a week there, odd jobs. He once took a job that might have been permanent, but walked off after two days, ashamed to tell why.

Accustomed to being paid at the end of each day, to buying food on the way home from work, he went back to day work because he feared his family couldn't survive until he drew his first paycheck after two weeks on the permanent job.

Work Habit Set

The work habits of Harry Lentor (not his real name), one of the hard-core unemployed, were set in his youth.

He isn't lazy; on the job he works as hard as any man. Ill at ease away from his usual haunts and companions, Harry sees himself as a failure. He wants to be among his own, for he's not marked among them.

There's new hope for the Harry Lentors in an effort called the Human Resources Development Institute, better known as the Buddy System.

The HRDI, a project of the Labor Dept., the AFL-CIO and the National Alliance of Businessmen, is jointly sponsored by the government and labor, $1.5 million by the Labor Dept. and $500,000 by the AFL-CIO in 1968.

Pilot Program

The funds were for the pilot program set up in 50 cities during 1968 to recruit hard-core unemployed, to train employed persons to work with the new people, encouraging them to stay on permanent jobs.

The pilot program was so successful that President Nixon ordered it expanded this year to 125 cities.

The buddy system is simple in concept, complex in operation.

Businessmen hire the hard-core unemployed. Labor recruits the buddies who train them. The buddies themselves are schooled in handling the problems of the hard-core. Their work is as much in imparting new attitudes as in teaching skills.

Advantages Taught

"The buddies keep them coming back day by day, teach them the advantages of being at a certain job, on time, of drawing regular paychecks," says Donald Bridges, HRDI staff member here.

"If it's the day-to-day money problem, the buddy might get the employer to pay the trainee part of his salary each day until the man learns how to budget on a weekly or monthly basis," Bridges explained.

"Sometimes it's transportation. The trainee can't see riding a bus an hour or so each way, paying part of his salary for that. Some of our buddies drive miles out of their way to provide transportation until the trainee's attitude changes," he said.

Buddies are volunteers and receive no extra pay. The businesses are repaid for out-of-pocket expenses. They also profit by reduced labor turnover, increased production, Bridges said.

Although Bridges works out of the AFL-CIO office here and is a former official of the Electrical Workers Union, he's quick to point out the project is not limited to union shops.

"We don't ask if the business is union or not. This isn't a union organizing effort," he said.

He admits there have been problems. One was the hiring by one plant of more men than there were buddies trained to work with the newly hired. As a result, Bridges said, 10 of the trainees quit.

Of the total of 92 hired by the five firms in 1968, he said, those 10 quit and one was fired justifiably, leaving 81 still working.

HOUSTON CHRONICLE Monday, May 19, 1969

Job Corps Returnees

Women Having Work Problems

BY SARALEE TIEDE
Chronicle Reporter

About 55 percent of local Women Job Corps returnees have jobs in uskilled areas unrelated to their Job Corps training.

Many of the others are unemployed, according to a report on the Job Corps Returnee Center at the Downtown Branch of the Young Women's Christian Assn.

59 Now Enrolled

In the first year of operation, the center has attempted to contact 250 Job Corps returnees here, said Mrs. Paul Titus, chairman of the center's advisory committee.

At present, 59 are enrolled in center activities, which include tutoring, job-finding, social and recreational activities, goodgrooming and counseling.

The girls were recruited from 190 graduates and 74 others who returned before completing the course.

The girls came from families with an average income of $67 weekly. About 50 percent of them are high school dropouts. Mrs. Titus said.

The YWCA center, financed by the Moody Foundation, Farish Foundation, and Hogg Foundation for Mental Health and private donations, was formed to pick up where the Job Corps left off, Mrs. Titus said.

"Realistically, the Job Corps cannot fill the gaps and deprivations of 17 years of poverty in one year."

Major Need Cited

The centers' staff, headed by Miss Joanne Rhone, says the girls major need is help in finding jobs. Most of the girls must contribute money to their family's support and 37 of them have children of their own, Mrs. Titus said.

The center has located jobs for five girls and placed four in training positions.

However, the main purpose of the program was not job-finding, but helping the girls meet problems which imprison them in poverty, Mrs. Titus said. The YWCA offers classes leading to an equivalency diploma and preparation for the licensed vocational nurse entrance exam, involving 40 girls.

Another 27 have participated in visits to colleges and five have already entered college as a result.

The YWCA now hopes to involve volunteers as "big sisters" to the returnees. The volunteers would help provide transportation and be a mature friend to the girl, Mrs. Titus said.

The center also needs more money to continue its work, she added.

WASHINGTON POST MAY 23 1969

100 Enrollees Join Fight to Retain Job Corps Center

By George Davis
Washington Post Staff Writer

Larry Ellis, 21, quit high school in his junior year. He was 16, and he started "running wild," he said, living at various places in the upper Cardozo area—sometimes with his father and sometimes with parents of friends.

He worked at more than a dozen jobs. None of them paid more than about $1.50 per hour.

Raymond Holloway, 18, was in a residential Job Corps center in New Jersey until it was closed in April last year. He came to Washington on his own to enroll in the Job Corps Community Center here.

Frank Lloyd, 18, dropped out of high school in the 10th grade because he said he wasn't learning anything. Three weeks ago, after one year in the Job Corps Community Center, he passed his high school equivalency exam.

The three are leaders in a fight by more than 100 enrollees to keep the center at 1402 Otis pl. nw. open despite Federal plans to close it.

"The center means a lot to us," said Ellis, "We're not going to be turned out like animals.

"When we were out there in the streets they called us crooks and hoodlums, and now that we have a chance to get an education they're talking about closing it, but we'll fight until the end. We're not going to leave."

The enrollees plan to fight on a local level an Administration decision announced last February to close 55 of the Nation's 110 Job Corps Centers by June 30.

The Washington center was scheduled to close May 30, but on Wednesday 45 corpsmen picketed the Office of Economic Opportunity's headquarters in support of center director Maurice Wells, who was inside trying to get funding for one more month.

"We hope we can pick up another sponsor in a month," Wells said yesterday.

Officials at OEO agreed to fund the project until June 30.

The Job Corps Community Center opened in September, 1967, as the only non-residential coeducational center in the Nation. Its purpose was to give high school level courses to dropouts who were members of the Neighborhood Youth Corps.

Of more than 200 students who have enrolled at the center, 28 have passed the high school equivalency exam. Others still enrolled say the training has taught them how to present themselves for job interviews and how to conduct themselves on the job.

Enrollees take educational courses at the center for two or three hours a day, and spend the rest of the work day in on-the-job training at various Government agencies where they earn $1.60 per hour.

The center is located at the northern edge of the 14th Street poverty area that was burned out during last year's riot.

Copied → Model Cities

Wed., May 14, 1969 ST. LOUIS POST-DISPATCH

Model City Board Job Plan

A summer program for hiring 1000 youths in the St. Louis Model City neighborhood was approved last night by the Model City Agency board of directors. The program would cost $500,000.

Funds will be sought from the Federal Government in place of other programs previously submitted by the Model City Agency. The board is expected to decide later this week what other proposals will be affected.

If the program is approved, the youths, 16 to 22 years old, would work 18 hours a week in federal agencies with offices in the St. Louis area. They would be paid $1.60 an hour. Youths under 16 would be paid $1 an hour.

Goal of 15,000 Jobs

The jobs would be in addition to those being sought through the Mayor's Council on Youth Opportunity, which has set a goal of 15,000 jobs for the summer. A similar program last summer provided work for 10,200 youngsters. The program costs about $500 for each youth.

Approval of the special program means that other proposals totaling $500,000 will have to be cut from the Model City Agency's over-all request for funding. The request was submitted for the third time earlier this month. A total of $9,485,000 has been allocated for the St. Louis Model City area, but the entire amount is not expected to be appropriated.

A team of federal officials is to visit St. Louis May 26 for a final review of the agency's requests. Budget proposals and other aspects of the job program must be submitted to the Department of Housing and Urban Development at least a week before the team visits St. Louis.

Five Conditions

Members of the board, in approving the program, attached five conditions to ensure that the Model City Agency and its neighborhood corporations would retain control of all phases of the program. They disapproved of involvement of other agencies, such as the Human Development Corporation and the Missouri State Employment Service.

The conditions set out by the board were:

(1) That an agency be selected by the Federal Government and the Model City Agency to administer fiscal matters.

(2) That only youth of the Model City area be permitted to take part in the program. The youths would be selected by the neighborhood corporations.

(3) That the program would not affect the area's standing in other job programs.

(4) That the program be monitored under procedures to be established by the neighborhood corporations.

(5) That all supervisors, youth leaders, co-ordinators and clerical personnel be residents of the Model City area.

The Rev. Lucius Cervantes SJ, co-ordinator of the Mayor's Council on Youth Opportunity, had suggested that the Model City Agency undertake the program. He said it was expected that about 35 per cent of the agency's proposed programs would not be funded and urged that the summer employment program be offered as a substitute for programs deemed most likely not to gain approval.

Buddy System

Corn Products and Illinois Local Agree to Aid Hard-Core Jobless

What is believed to be the biggest program in the nation to put the hard-core unemployed to work has been placed in operation by Corn Products Co. in conjunction with the federal government.

Nearly 60 men already are enrolled in the program at the Argo, Ill., plant. Plans are to train and employ a total of 200 during the next two years.

An agreement between Corn Products and Argo, Ill., Local 7-507 was ratified by the local membership Nov. 20, after a recommendation by the local bargaining committee. It spells out the purpose of the program and how it will be put into effect.

The agreement points out that both the company and the union recognize their responsibilities to help those who are unable to find a job. The program to train those "hard-core" unemployed is part of the national plan sponsored by the National Alliance of Businessmen (NAB) with the support of the U.S. government.

The objective is to develop them into productive members of Corn Products' work force and of the community. The union, by accepting the agreement, endorsed the program and pledged to help make it successful.

Participants in the program will be designated "special status employes" until they qualify as permanent employes. They will be on probation for 20 weeks before entering the normal 60-day probationary period. However, if required, the two probationary periods can be extended to one year.

They will receive both classroom instruction and on-the-job training.

The special status employes will not have seniority until they are placed on permanent status, at which time their seniority will be adjusted to the date of their original hire.

They will be subject to layoff before any permanent employe, will not work overtime, and will not displace any permanent employe. They will, however, be represented by the union in matters concerning wages, hours, and other working conditions. The company will have the right to determine transfers, layoffs and discharges of the employes, but in all other respects the terms of the labor agreement will apply.

A special steward assigned by the union will handle grievances of the special status employes.

•

The basic education course will teach the employe oral reading and mathematics, and he will study the 5,750 most commonly used words in the English language.

A program called personal human development also will be offered, which is aimed at the changing of attitudes and behavior and understanding personal problems. Some of the areas to be covered are: How to get and keep a job, safety, roles of management and union, how to use a checking and savings account, insurances and health education.

Supervisors in the plant will be offered a 39-hour training program so they can understand the hardships facing the hard-core unemployed. In addition, minority persons recruited or already employed by the company will be selected for training for management positions.

Sec.-Treas. R. C. Reinke of Argo Local 7-507 in commenting on the program, describes it this way: "To our knowledge, this is the largest hard-core unemployment program being operated in conjunction with the federal government, so we expect a lot of people will be watching what we do with it. Personally, I believe it to be the best thought-out program of this nature I have seen."

CASE PROBLEMS FOR BUDDIES

THE SITUATION:

1. Walter, the worker you are assigned to help, is 22 years old and has never held a job for more than a few months. He was out of work for two months before getting this job. He's friendly and appreciative of your efforts to be his buddy on the job. Around closing time on the first day he tells you that he's flat broke. He asks you for a $5.00 loan until pay day.

THE QUESTION:

How would you handle it?

THE SITUATION:

2. You are Juan's "buddy". When he's at work he does fine but out of his first 20 days on the job he has failed to show up or call in on three different days. The company hits him with a three-day disciplinary lay-off. You wonder if he'll bother to come back.

THE QUESTION:

What would you do?

THE SITUATION:

3. The foreman calls you in and tells you that he's thinking of hiring a man who has come off the street and applied for a job. The foreman says, "I'll take a chance and hire him if you say so."

THE QUESTION:

Is it your function as a buddy to approve or disapprove of new hires?

BEST COPY AVAILABLE

THE SITUATION:

4. You've been asked to serve as Roger's buddy. He is 50 years old and has a large family. He's very willing and a hard worker but you find out that he does some things wrong because he can't read or write.

THE QUESTION:

Can you think of ways that you might help Roger around this handicap?

THE SITUATION:

5. This is Joe's first job. He's a 19-year old school drop-out. He's on the night shift with you. The second night he calls in and says he won't be in because his mother is sick. He doesn't call in the next night -- or the next.

THE QUESTION:

What would you do -- or have done -- at this point?

THE SITUATION:

6. Cindy is 20 years old and has a two-year old child but no husband. She reports to work the first day in an extremely short, tight mini-skirt and loaded down with junk jewelry. She is also loud in a talkative know-it-all way. You can tell the other people in the shop resent and dislike her immediately.

THE QUESTION:

How would you help her? How would you try to help her gain acceptance from the others.

THE SITUATION:

7. Because you've been selected by the company to take part in the buddy program some of your work mates seem to be jealous. Most of them limit

their comments to kidding, "We didn't know you were the foreman's pet" but one, Big Sam, who is 6'7" and weighs about 285 pounds has been muttering about how some people who think they are big shots will get "a punch inna mouth" if they don't watch out?

THE QUESTION:

How would you react to the kidding? How do you handle the situation with Big Sam?

THE SITUATION:

8. Your union steward tells you he has heard about this "Buddy Thing". He tells you that since he's the steward he ought to be doing the buddy's job instead of you.

THE QUESTION:

How would you explain the difference between your job as a buddy and his as a union steward?

THE SITUATION:

9. When you are first introduced to Larry, age 24, he gives you a mean look and tells you, "Man, I ain't got no need for no nursemaid."

THE QUESTION:

What's Larry's problem? How would you reply?

THE SITUATION:

10. Your new hard-core worker is a widow with three children. She was on relief until trained for this job. She seems anxious to please but is worried and distracted. You find out that her child is very sick. From the way it

THE SITUATION:

13. You are assigned a new worker whose problem is that he doesn't speak English very well. On the job, though, it turns out he's an extremely capable worker and fast -- so fast that the other workers are calling him a "rate-buster."

MATERIALS FOR USE IN

BUDDY TRAINING

QUESTIONNAIRE

THE BUDDY'S JOB

Which of the following things do you think you should do as a buddy?

		DO	DON'T
1.	When you get a buddy assignment you should go to the personnel office and find out something about him.	☐	☐
2.	You should explain your role as a buddy to the union steward in your department.	☐	☐
3.	You should discuss what the program is all about -- as well as your part in it -- with your foreman.	☐	☐
4.	When the new worker is brought in you should try to introduce him to all the people he will be working with.	☐	☐
5.	If the new worker has problems getting along with one or more of the people in the department you should try to find out why -- and help to smooth things over.	☐	☐
6.	In helping your new worker get familiar with his new surroundings you should take time to show him where such things as the washroom and lunch room are located.	☐	☐
7.	When he begins working you keep an eye on him so that you can help him when he needs help.	☐	☐
8.	If he is late or misses work without calling you should take him aside and talk to him about it.	☐	☐
9.	If he doesn't seem to catch on to the job and makes one mistake after another you try to figure out a way to correct the situation.	☐	☐
10.	In being a buddy you are, above all being a <u>friend</u> to the new worker.	☐	☐

SITUATIONAL RESPONSE QUESTIONS

Problems Dealing with the Buddy's Relationships with the New Employee:

1) It is 10 minutes past starting time and the new employee has not shown up for work. What do you do?

2) If you truly find the new worker's personal appearance offensive to you, what do you do?

3) You have heard that the new employee has been seeing his old friend who you suspect might entice him into not going to work. What do you do?

4) You have just learned that the new worker's wages have been garnisheed. What do you say to him?

5) The new employee has a personal hygiene problem. What do you do?

6) When you introduce yourself to the new worker he tells you in no uncertain terms that he doesn't want a buddy. What do you say and do?

Problems Dealing with the Buddy's Relationships with his Fellow Workers:

7) If your fellow workers find the new worker very attractive and give her too much attention, how do you react?

8) Your fellow workers are ignoring the new worker. They won't sit with him in the cafeteria and conversation ceases when he appears. What do you do?

9) Joe, who is quite the practical joker, has been giving the new worker false information about work rules and, thus, adds to the new worker's confusion. What do you say to this practical joker who has been a close friend of yours in the past?

10) The new employee has been out-performing the rest of the crew and this is disturbing to them. They tell you that the boss will wonder why they don't produce as much. How do you reply to them?

11) The new employee can't keep up with his work and the rest of the group feel they have carried him too long. What do you say to them?

12) Some of the fellows who are on the job are laughing at the new worker because of the way he dresses - the way his clothes fit, and his cleanliness. What do you say to them?

13) Yesterday the new worker came into work "stoned" and you and Frank, the boss, took him into the washroom and sobered him up. This morning Sam, who has worked here for years, came in just as bad and the boss gave him written notice with a one-day suspension. A group of the fellows in the department approach you and ask why this preferential treatment. How do you respond?

Problems Dealing with the Buddy's Relationship with the Supervisor:

14) Your first day back from training the supervisor tells you that although he respects your task of being a buddy, he will in no way tolerate any disruptive activity. How do you reply?

15) The supervisor comes to you and says that he doesn't think the new employee will make it, that he is not cut out for this type of work. What do you say?

16) The supervisor comes to you and says he believes in giving these new guys a break, however he is restricted by the contract and therefore anything they do will have to be without the shop steward's knowledge. What do you say?

17) The supervisor tells you he does not know what the Buddy System is all about but he is running this department and he gives all the orders to new and old employees. What do you say?

Problems Dealing with the Buddy's Relationship with the Shop Steward:

18) Your shop steward tells you that he handles all grievances and you had better not make any kind of deals without his knowledge. What do you say?

19) The shop steward tells you that it is not your job to tell the new worker about the union because you might give wrong information. What do you say?

20) Your shop steward tells you that he has told all the guys in the shop not to bother you because of your job and if you have any problems with anyone he'll "lean on them." What do you say?

Most of them limit their comments to kidding, "We didn't know you were the foreman's pet" but one, Big Sam, who is 6'7" and weighs about 285 pounds has been muttering about how some people who think they are big shots will get "a punch inna mouth" if they don't watch out?	How would you react to the kidding? _____ _____ _____ How do you handle the situation with Big Sam? _____ _____ _____
8. Your union steward tells you he has heard about this "Buddy Thing". He tells you that since he's the steward he ought to be doing the buddy's job instead of you.	How would you explain the difference between your job as a buddy and his as a union steward? _____ _____ _____ _____

THE SITUATION:	THE QUESTION:
9. When you are first introduced to Larry, age 24, he gives you a mean look and tells you, "Man, I ain't got no need for no nursemaid."	What's Larry's problem? _____ _____ How would you reply? _____ _____
10. Your new hard-core worker is a widow with three children. She was on relief until trained for this job. She seems anxious to please but is worried and distracted. You find out that her child is very sick. From the way it sounds you think the child ought to be in the hospital.	Is this your problem as a buddy? _____ If so, can you think of ways you might help? _____ _____ _____
11. You seem to have had more success as a buddy than anyone else. The foreman keeps assigning one after another to you. You are now working with five hard-core people all at once. No-one else has more than two. The foreman calls you in and asks you to take "just one more."	Should you do it? _____ _____ _____ _____ _____
12. Charley, a 21-year old, has been hired in on the day shift and is doing fine except he can't seem to get to work on time. He's always 15 minutes to a half-hour late. You talk to him and find out that his mother is an invalid and he has to get his smaller brothers and sisters off to school before he can leave home in the morning.	Can you think of a solution to Charley's problem? _____ _____ _____ _____ _____

THE SITUATION:	THE QUESTION:
13. You are assigned a new worker whose problem is that he doesn't speak English very well. On the job, though, it turns out he's an extremely capable worker and fast -- so fast that the other workers are calling him a "rate-buster."	Who would you talk to in this case?_____ The foreman? the new worker? the other workers? What would you say?_____ _____ _____
14. One of your friends in the shop tells you that you're wasting your time trying to help "those people". You ask him what he thinks "those people" are like. He replies, " They're a bunch of dirty, lazy, shiftless bums."	What's your friend's problem?_____ _____ How would you explain your role as a buddy?_____ _____
15. Your "hard-core" worker finds out on pay-day that everyone else in the shop is making 50¢ to $1.00 more than he is. He gets up tight, saying,"I'm doing the same thing they are." He tells you they can shove "this job".	What would you say?_____ _____ _____ _____
16. When Gordon is introduced to you the first day he has a fine, thick Afro haircut -- so thick, in fact, you can't find a safety helmet to fit him.	Should you let him take his chances?_____ What would you suggest? _____ _____
17. There is no doubt in your mind that the foreman is "riding" Johnny, your new hard-core worker. He watches him constantly, waiting for Johnny to make a mistake. You can see that this is causing a lot of work to be ruined.	Who would you talk to?__ _____ How can you help the situation? _____ _____ _____

A SECOND CHANCE FOR NINETY MEN IN NORFOLK

by James W. Canan

The Reporter, July 16, 1964

First Training Program Provides Lessons of Benefit to Future Projects

Seventy-eight of the ninety unlettered, unemployed Negroes who struggled through a year's training in Norfolk, Virginia, have found steady jobs since their graduation last November. But even more important than these individual success stories was the experience gained in the first attempt to train the hard-core poor under the Manpower Development and Training Act of 1962. It was in large measure the lessons learned in Norfolk that led Congress to amend the act for the benefit of future projects. And, yet, despite these and other accomplishments, it is by no means certain that the project can be repeated on a large scale in other communities.

The success of Norfolk lay largely in the drive of those responsible for it to remold the men in it, however great the odds. Matching that drive will be difficult, even with more help from the Federal government.

The project, designed to overcome the interrelated problems of illiteracy, unemployment, and racial discrimination, was devised by the Norfolk division of the Virginia State College, and all-Negro institution. The idea was not so much to teach skilled men new skills or to help them shift from dying trades to promising ones as to make literate craftsmen out of men whose only marketable assets were their muscles.

Manpower Training Was Not Reaching Those Who Needed it Most -- Illiterates

Secretary of Labor W. Willard Wirtz assigned top priority to the Norfolk project, as overseen from Washington by his Office of Manpower, Automation and Training (OMAT). He was disturbed because the manpower-training programs were not reaching the unemployed who needed them most, namely the nation's illiterates, among whom Southern Negroes predominated. Hence, Wirtz described the Norfolk project as "one of the most important and critical experiments going on in the United States today." He noted that Negro heads of families were unemployed in twice the numbers of their white counterparts. He blamed in part "the continuing fact of discrimination," but asserted that the Negroes' biggest drawback was their lack of training for many of the jobs otherwise available to them.

The encroachments of automation at the naval bases, shipyards, and coal piers that dominate the Norfolk area's economy illustrate Wirtz's point dramatically: they are bad news for the unskilled laborer, black and white. Four years ago, the Navy reported to the Negro college that the installation of computer controls in warehouses and of machines for loading ships' stores would soon mean laying off some three hundred Negroes. Was there anything the college could do to train Negroes to handle jobs requiring some judgment? If there was, the Navy would do everything possible to hire them.

College Plans Program for Hard-Core Unemployed

The college responded by conceiving its training project. But not until passage of the Manpower Act in 1962 was the college able to proceed on grants of $135,000 from the Labor Department for the trainees' allowances and $125,000 from the Department of Health, Education and Welfare to pay administrative and teaching costs.

Most of the hundred Negro men chosen for the Norfolk courses in auto mechanics, bricklaying, electronics, sheet-metal work, and janitorial duties were of the "hard-core unemployed" (and resented being so described). Ranging in age from twenty-five to sixty and averaging four children each, they could not read well enough to pass the standard aptitude test that ordinarily determines whether a man is qualified to be trained under the Manpower Act. They had bleak histories of share-cropping or of desultory employment in what they called "pick-up work," and they all realized the futility of seeking steady work with brawn alone to offer.

Officials at the Norfolk college were convinced that it would be necessary to instruct the men in many other areas besides shop courses if they were to make their way in the modern job market. The ability to read, to write, to be fairly well spoken -- and even to listen -- seemed just as essential to success. Furthermore, the officials believed that the dignity to be gained from becoming skillful would stimulate a yearning for increased literacy, and vice versa.

Basic Education Techniques Tried Here Become Standard

Thus fifty of the trainees were given additional instruction in reading, writing, spelling, arithmetic, and just plain communcation ("How to Talk to Your Supervisor"). The others received vocational training only. The fortunes of the two groups, along with those of another hundred men who received no training, will be compared a year following the project's completion. There is enough evidence already, however, to vindicate the concept. As a result, the "basic education" techniques tried for the first time at Norfolk have become more or less standard in manpower programs.

But it was one thing to plant the theories and quite another to nurture them. The first of many problems encountered by the college was to attract the attention of men who do not expect that anything good will come their way, and who consequently tend to be too shy or too sullen to take advantage of it when it does. The state employment office in Norfolk used its files to round up prospects for the training, and mass media publicized the project, but the response was negligible. One college official observed that the publicity produced "a very favorable atmosphere among the literate public," but not much else. Either the unemployed had no desire to learn new skills or else they had not been reached. At any rate, it was apparent that they were not likely to apply for training just because it was there; they had to be found and then convinced that it was to their advantage to sign up.

Recruiters go to Poor Neighborhoods and Churches in Search of People

Professors and undergraduates spread the word through the pastors of Negro churches, concentrating on those in poor neighborhoods and being careful to include all the "cult" congregations. They roamed the streets in teams, talking about the project to anyone who would listen, distributing simply written fact sheets in the places where the idle congregated. After a month, the employment office and the college had more than enough applicants.

Many of them, not understanding the unique purpose of the project, were puzzled as to why their comparative keenness of mind should weigh against their being chosen. In point of fact, however, several who showed acumen were selected, to give the classes the pupil leadership that the college felt would be impossible to attain with classes made up entirely of "defeated people."

Once the classes began, the instructors ran into resistance from the trainees in the basic education courses. They made it plain that they had signed up to be shown how to get big pay checks, not to pore over readers and spellers. But within a few weeks, they began to take pride in their studies and drew the envy of the others. It became a matter of course for those taking the three Rs to share what they had learned with those who were not. It was a revelation that all but a few of the trainees, in both groups, showed a deftness of hand and mind that belied their dismal backgrounds and low aptitude-test scores. Moreover, the average reading level of those in the basic education group improved markedly.

Dropouts Threaten Program Because Trainees Cannot Support Families

About a year ago, just as the project seemed to be proving itself, it was threatened with a crisis: dropouts on a scale that would have finished it then and there. Ten trainees already had departed, some because they could not resist job offers. One, for example, took a job as a front-end man in an auto-body repair shop at $90 a week, a fortune for him. Most quit or were seriously considering quitting, however, because they could not support their families on the weekly allowances they were receiving from the government.

Under the Manpower Act at the time, a trainee was forbidden to work part time, and was limited to an allowance no greater than the level of unemployment compensation of the state in which he lived. The level in Virginia was $27 a week, and most of the trainees, despite histories of irregular work, had been able to do better. With summer at hand, they longed to apply for the jobs and the big tips possibly awaiting them at Virginia Beach and other resort areas. At one point, the teachers and staff began making small out-of-pocket loans to starve off the trainees' creditors, and arranging for donations of food, clothing, and even toys.

Congress Amends MDTA to Allow More Money for Training Allowances

Confronted by this challenge to the project, which Wirtz had said "has got to work," the Labor Department approached a private foundation, which provided $29,000, enough to add $15 a week to the income of each trainee, plus $2 a week for each dependent. There were no more dropouts, and absenteeism dwindled to almost nothing. As a result, Congress amended the Manpower Act to authorize bonuses of up to $10 a week to trainees who, in the judgement of the Secretary of Labor, just can't make it on their allowances. In addition, trainees now may work as many as twenty hours a week, thus lessening any urge to forsake training when part-time work becomes available. And Congress also appropriated more money to train "functional illiterates" in the Norfolk pattern.

But money wasn't the only problem encountered in the Norfolk project. Not surprisingly, many of the trainees had personal and family problems. Halfway through the courses, the college felt compelled to borrow Mrs. Vivian Ewing, a Negro case-worker, from the Norfolk Social Service Bureau to counsel the men.

Counseling Helps Trainees and Wives Adjust Better

Mrs. Ewing went beyond counseling and referring. She organized the trainees' wives into a club; helped them to budget for low-cost, nourishing meals and to organize their households; arrange picnics; attempted to relieve the fears of some of them that their husbands might develop a yen for the co-eds at the college; and repeatedly planted the idea that they should be proud of their husbands and of themselves.

One faculty member, who praised Mrs. Ewing for her achievements, nonetheless expressed misgivings: "I wonder," he said, "how these men will react when they have to show up on the job on the dot every day and stay steady, without her to hold their hands when they have troubles." Thus far, his doubts have not been justified.

What Were Some of the Problems in Placement?

For all the spirit and confidence that had developed by graduation time ("The hall was packed and the undergraduates cheered; you'd have thought they were graduating from Harvard," said one professor), it took two months to get thirty of the trainees hired and two more to bring that number up to fifty. The Navy, which had been expected to hire nearly all of the electronics and sheet-metal workers, was stymied by a reduction in the civilian work force of the entire Defense establishment. The weather had turned cold, and so had the bricklayers' prospects.

Eight months after the end of the project, the Navy has managed to hire only one trainee. Even so, sixty-six of the ninety who earned certificates are working at their trades -- including fifteen of the sixteen bricklayers -- or at related jobs. Twelve others have found work in different fields. One of them, the sixteenth bricklayer, exemplifies an important side benefit of the training; the self-discipline that comes with having seen something through. His big handicap always had been a violent temper, which flared up a few times early in the training and rendered his future dubious. He learned to control it, and because he had, was recommended to an agency that supplies guards for stores. Not long after being hired, he broke his hand while defending a supermarket against young hoodlums who had been vandalizing it, and became something of a local hero.

Trained Men Break Through the Segregation Barrier

Especially striking was the impact of the project on segregation. One graduate became the telephone company's first Negro lineman in Norfolk at $72 a week. A previously all-white automobile assembly plant took on four trainees, two for the assembly line at $3.50 an hour and two for maintenance work at $2.52 an hour. One of the assemblers made $200, with overtime, his first week on the job.

To be sure, some members of the unusual graduating class have not been so fortunate. It is believed that one trainee was fired from a good job because he refused to change an elaborate hair style that his white co-workers found offensive. Another joined the Black Muslims upon graduation. Eight of the trainees found jobs at a plant in North Carolina, only to be laid off in short order for reasons that have not been made clear.

But on balance, the project must be reckoned a worthwhile experiment. In a recent progress report, Dr. William M. Cooper, who directed the project, wrote: "We are continuing our efforts to place and upgrade trainees. Co-operation of the employment offices has been good. The employment situation is fluid and ever-changing. Our trainees are responding to these changes to better their employment and pay ... Our hope is that this report will help in promoting the total manpower effort."

At the very least, it looks like a step in the right direction.

Coins Cleared From Rails of Kennedy Train

Washington Post News Service

Washington, D. C. — As the train bearing the casket of Sen. Robert F. Kennedy neared Washington, police in Prince George's county, Maryland, cleared the tracks of coins placed there by spectators who wanted them crushed as souvenirs.

Police said the coins — pennies and some Kennedy half dollars — might have put the train in danger of derailment.

JOBLESS TRAINING BEGINS WITH ABC'S

Chrysler Chief Says Task Is Harder Than He'd Thought

By JERRY M. FLINT
Special to The New York Times

DETROIT, June 15—Training the hard-core unemployed—even for factory work—is more difficult than imagined and there are no "overnight solutions," an automobile company president warns.

It can involve teaching a man how to catch the correct bus, or how to get up in the morning, or getting him glasses so he may learn enough reading for simple jobs, Virgil E. Boyd, the president of Chrysler Corporation, said.

Nevertheless, the problems have not discouraged Chrysler's efforts. The automobile maker signed two Government contracts this week for $5.9-million to train 2,000 hard core unemployed for factory work and 1,000 for work as auto mechanics.

After the Detroit riot last July automobile companies began recruiting Negroes from Detroit's inner city.

"But there were some who simply couldn't be put to work," Mr. Boyd said in a talk to newspaper advertising men. "I to take 750 of the hard-core meant, until we became involved in this area. I was wrong. Hard core refers not to those without steady jobs, but to those who are not equipped for any job. Not the unemployed, but the unemployable—those who are unable to fill out even a simple job application."

He said Chrysler and the Federal Government recently started a two-year experiment here to take 750 of the hard core unemployed and give them whatever training was required to make them able to work. This did not mean instructions on using machinery.

"These people," he said, "can't read simple words such as 'in' and 'out' signs on a door."

They have to be taught the letters that spell common colors," he said, "so they can read the instruction card that tells them to put a blue or green steering wheel on a car as it comes down the assembly line."

And, he said, they must learn simple addition "so that they can count boxes of parts they take off a supplier's truck."

Some sign an "X" for their names, some fail to show up, and many come late.

Many officials at Chrysler are "more than ever convinced that all the people who aren't working just don't want to work," the executive said.

"These people," he said, "were not only offered jobs, but the offers were made right on their own blocks or at the favorite corner for standing on, or in the church basement or the poolroom. So if they didn't show up, they didn't really want to work."

Confusion Over Buses

But checking showed the answer "in many cases was childishly simple," he said. "If you can't read, how do you know what it says on the destination signs of the many buses that go by on a given busy street. And a grown man isn't going to get on—and be sent off—the wrong bus very many times before he stops getting on buses any more. So we showed those people, one by one, how to recognize the right bus to take, and in some cases how and when to transfer to another necessary route."

When Chrysler checked on why many were regularly late, he said, the company discovered that "only one in five owned an alarm clock. Why? Because they'd never had to be any particular place at any particular time before."

He said the trainees were taken into plants and shown men "just like themselves who owned cars and clothes and houses and owned them because these men lived within the rules of an industrial society and showed up for work, on time, every day."

Once the hard-core people "knew how and why to come to work, their attendance and tardiness record was 500 per cent better than the average of all our employes," Mr. Boyd said.

He said examinations showed that 40 per cent of those rejected for physical reasons were turned down for poor vision. "And after these rejects were sent to the proper agencies, were tested and fitted for glasses," he said, "our people found that many of them could very quickly pick up the elementary reading skilsl required for simple jobs."

After sufficient motivation and direction the trainees "performed at the average level within a relatively few weeks," he said.

Under the Government contract, Chrysler has 23 weeks to train them for useful work.

"It hasn't been an easy job," Mr. Boyd said. "In addition to bus routes and alarm clocks, we have had to overcome fear and resentment, hostility and a history of failure."

But the first group was ready after eight weeks of training, and of 44 put on the job only one quit, he said, "and that beats our walk-in employment record by a wide margin."

Buddy Training

Building work-group support
for the newly recruited disadvantaged
worker in the JOBS program.
The RADET Corporation

In brief, the Contractor will develop, implement, and evaluate a program for training buddies to support and assist disadvantaged persons hired under the JOBS program. This program is to be carried out in five cities, determined by the Manpower Administrator, U.S. Department of Labor, or his designee. The dates will be chosen from among those made available by the Contractor. In general, the training dates will consist of two or three day periods after July 15. Whether two days or three, each training program will require eighteen hours.

Statement of work to be done

The training program development includes "Design" and "orientation." The Design of the program implies setting objectives for the training, choosing methods for doing the training, and finding Trainers to carry out the program. Orientation implies participating in the one-half day Orientation programs being organized by Greenleigh Associates. There are five such programs. They will be held in the five cities designated by the

Department of Labor, on dates agreed upon by Greenleigh and the Contractor.

Implementation implies that the Contractor will select the Trainers, orient them, and conduct the 18 hour Workshops in the five cities selected; and that he will arrange a brief "follow-up" or refresher session within a few days after each such Workshop.

Evaluation includes the collection of field data to measure the impact of the training, and the evaluation of impact; it also includes the preparation of a final report. The final report will contain five copies of a "prototype" training program. The prototype program is a set of instructions for a Trainer, with copies of the materials actually used in the training. The Trainer's instructions will be sufficient to allow a professional trainer (whose qualifications will be indicated in the Evaluation part of the final report) to put on the program.

Phases of Work

The work is divided into the following phases:

1. Design (estimated completion date: July 15)
2. Orientation (estimated completion date of last orientation depends on Greenleigh)
3. Implementation (estimated completion date: two weeks after completion of last Orientation)

4. Follow-up (est. compl. date: two weeks after completion of last Workshop)

5. Evaluation (est. date of rough Report, October 15; of final report, November 30, 1968).

Overall purposes and objectives

Groups of Buddies (9-21 is the size of each of the five Workshops) will be trained to anticipate and deal with the various critical on the job problems faced by newly recruited disadvantaged workers. The overall purpose of the Buddy system is to make it more likely that the JOBS program will be effective. Thus, the Buddy training is a "sub-system" of the Buddy system, which is in turn designed to make the JOBS program meet its economic and social aims.

There are three objectives in the Buddy training program:

1. Obtain acceptance of the Buddy role, and develop at least an elementary skill in carrying out that role, in handling the various problem situations likely to arise in the Buddy's relationships with the newly hired person;

2. Develop skill in dealing with the Buddy's co-workers when such problem situations involve this "peer group;"

3. Develop skill in dealing with the Buddy's supervisor and shop steward when the problem

situations involve them.

Each of these Objectives in turn implies Sub-objectives, as shown below:

1. Obtain acceptance of the Buddy Role...

1.1 To explain the role of Buddy

1.2 To help him see his personal stake in the Role

1.3 To arouse his willingness to take the risks involved in this role

1.4 To develop an understanding of the situation confronting workers new on a job

1.5 To develop an understanding of the situation confronting disadvantaged workers

1.6 To help the trainee see various ways in which each problem situation can be constructively handled.

2. To develop skill in working with the Buddy's "peer group"...

2.1 To develop an understanding of the way "informal workgroups" use their power

2.2 To help the trainee see various ways in which he can deal with "peer power"

3. To develop skill in working with the supervisor and the shop steward..

3.1 To develop an understanding of the way foremen and stewards react to new workers and disadvantaged workers

3.2 To help the trainee see various ways in which a Buddy can deal with the Foreman and the shop Steward.

Note: in non-unionized companies and other circumstances, substitute the appropriate terms for "Foreman" and Shop Steward.

Design of the Program

The Program Design essentially consists of developing the role playing and other exercises and training materials which will be used during the 18 hours, to achieve the above mentioned objectives. The Design also requires a rapid build up of information about the kinds of persons who are likely to be recruited for the Buddy role and training. For example, will the Buddy be drawn from that part of our society--- the "blue collar', lower-income white groups who are most threatened by minority group demonstrations, housing drives, and educational demands? A training program effective with such Buddies would be quite different in content than one directed toward Buddies who were selected because of their high seniority and lack of antipathy toward minority groups.

? so what's the answer -
how about Negro buddies -

Philosophy of training. Our methods of training seek specific changes in human behavior, but we try to avoid the mechanical assumptions implicit in programed instruction and similar training procedures. We stress the relationship between Trainer and Trainee -- as opposed to "getting through the agenda."

This means that we will try to define the sub-objectives listed earlier (page 4) in terms of specific behavior, so that we can determine whether the training has been effective. But we will emphasize the necessity for the Buddy to make his own decision about his commitment to the role.

The methods of training will draw from techniques familiar in adult education and industrial training: those, such as role playing, which involve the participant in relevant activity, rather than in purely passive listening; and those techniques which place the trainee in situations similar to those which he is likely to encounter on the job.

Problem situations. Role playing and other training exercises will be built around such problem situations as those listed on the following page. Our research to date has led us to expect that these kinds of problems will frequently arise in the Buddy system. The question for each problem situation is, "What can the Buddy do to help?" In some of them, the answer may

well be, "Nothing." In others, he may be able to take a very active role. In most cases, the training can help the trainee see that there are several possible ways of reacting constructively to a given situation. The training can also help him see which ways of reacting are destructive .

Tentatively, the problem situations involved in the Training Program will include:

1. The New Worker fails to show up for work.
2. The Worker shows up with a hangover and wants to take a drink on the job.
3. The Worker wants to borrow money from other workers.
4. The Worker does an outstanding job but the Foreman fails to notice it.
5. Lunchtime comes, and none of the other workers sits down for a sandwich with the New Worker.
6. The Worker doesn't want to follow the safety rules.
7. The Worker does very poorly on the job.
8. The Buddy takes the New Worker to the coffee counter and finds that his co-workers avoid both of them.
9. The Worker shows up in shabby clothes and one of the co-workers ridicules him.
10. The Worker wears a funny-looking haircut and the Foreman tells him to change it.
11. The Worker's ghetto buddies show up and hang around the place of work, every day around quitting time.
12. A Foreman puts pressure on the Buddy to do something which he thinks will make the Worker fail.
13. The company gives the New Worker a hard assignment or promotion for which he is not ready, with the obvious intention of making him fail.
14. The Quality Control inspector starts rejecting the work of the New Worker, by applying tighter standards than he uses with other people.
15. The Personnel Department tells a New Worker he will have to take a test, but the Buddy knows the Worker is afraid the others will find out he can't read.

In each such Problem Situation, a short description of the roles involved is part of the Trainer's instruction Manual. In these roles (when they are considered together),

the situation is described in much greater detail than above.

Arrangements for training. The training schedule will be worked out with the Greenleigh Associates, as will the choice of a training site. The site must be such as to permit the kind of training and the methods described above.

Orientation

The orientation sessions will be scheduled in coordination with Greenleigh Associates. The Contractor's part of each of the half day orientations will be the description and explanation of the Buddy training program.

Implementation

Following each Orientation workshop, after Greenleigh Associates notify us that the Buddies have been recruited and are available for training on a specific date, the Contractor will schedule a Workshop. The Contractor will select the training site.

It is understood that this will be done only after Greenleigh Associates can give assurance that the Buddies (9-21 for each Workshop) have been given "released time" by their companies, and that the Buddies have agreed to appear for the training.

Who negotiates released time

We will then schedule one of our Trainers, provide the materials, and conduct the training. At that time, we will collect certain data to be used later in

evaluating the effectiveness of the training.

We, The Contractor, are in complete charge of the training. In our philosophy of training, the trainees must feel completely free to participate. Any authority to visit or observe must be obtained from the Trainer. Participation of observers will be regulated by the Trainer.

The program will require about 18 hours in a block of time. This means that the trainees must not intermittently return to the job. The program may be given in two or in three days. It may be scheduled during the working week , on the weekend, or with the combination of the two.

Follow-up

The Trainer will return to each city within three weeks for a brief "refresher" meeting with the trainees. This follow-up meeting does not require released time unless some of the trainees are working on the evening shift. When the Buddies are originally invited through Greenleigh Associates to participate in the three day Workshop, the Follow-up date should also be scheduled at that time. This date must be acceptable to the Trainer.

The value of the Follow-up meeting is greatest for those Buddies who have been assigned a Disadvantaged Worker since the completion of the Workshop. It is

possible in some cities that Greenleigh Associates will conclude that such a Workshop Follow-up will not be useful, but it will be the Trainer's option as to whether to conduct it.

Evaluation

A Field investigator from the Contractor will visit each city within four to five weeks following the Workshop for individual interviews with each trainee, his Supervisor, the disadvantaged worker assigned to the Buddy trainee, and possibly other peers of the worker. The Field investigator will talk to the Shop Steward if it is feasible.

In this interview, the Contractor will collect the data necessary to determine the impact of training, the degree to which the trainee has carried out the Buddy role, and the effects on the newly hired disadvantaged worker. The interview will be of the open-ended type in the main.

The findings of the interview will be held completely confidential. They will be encoded to determine which of the sub-objectives of training (see page 4) have been best achieved, and under what circumstances the training program appears to have obtained its best results. With the aid of this analysis, the less productive units of the training will be removed, and an imporved design produced.

In addition to the Field interview, certain impressions are collected during the training from the Trainer, Trainees, and any observers who may be present. These

impressions should be collected in such a way as to answer the following questions about whether an effective climate for learning has been established in the particular Workshop:

--does each trainee feel free to participate to the fullest extent practical?

--does each trainee "identify" himself with the trainer as a human being?

--has the trainee group formed a sense of unity (or "we-feeling")?

--do the trainees feel <u>involved</u> in the training?

--do they consider that they are learning something which affects their vital interests?

A third type of question involved in the Evaluation is the cost-effectiveness of the training. It is true that a program under development cannot meet the same cost standards other programs do. However, we can state that the standard costs we visualize for the program whose prototype we are going to produce, as the end-result of the evaluation, will lie somewhere between University undergraduate instruction costs and management training costs.

Cost standards set without any reference to effectiveness are, however, dangerous. In our final report, we will relate the cost estimates of the

Prototype program to the evidence of Effectiveness.

The Evaluation-- especially the Field Investigators' reports-- will produce evidence of the operation of the Buddy System itself. We will incorporate this evidence in our Final Report.

Finally, in the Evaluation report, we will include the training program as re-designed in the light of the Evaluation. This new training program will be in the form of an instructor's manual, ready for use.

Buddy Project Informational Memorandum No. 1

From Jules Pagano, Project Director

The Buddy System is designed to assist new ("hard core") employees in adjusting themselves to their work environment through the counseling and guidance of co-workers on a person - to - person basis.

Five cities have been selected, based on the number of unionized plants employing the hard-core unemployed, cooperative management, effective union leadership, qualified full-time AFL-CIO community services representatives, and interested social agencies. Each program in these five cities will select and train 20 to 25 special union counselors or "Buddies", who will assist the hard-core employee in:

a) adjusting to plant routine and job requirements;

b) obtaining aid and assistance as needed from community health, welfare, recreational, educational facilities and resources;

c) establishing good working relationships and coping with problems which might arise;

d) encouraging participation and involvement in union activity to insure his acceptance of his role as a union member.

In order to implement the contract that calls for the establishment, coordination, and evaluation of a Buddy System under the National Alliance of Businessmen's Jobs Program in five cities, Greenleigh Associates has:

a) recruited and staffed coordinators and senior consultants for this project, and

b) conducted a two-day orientation and planning session for Greenleigh staff and representatives of the Community Services Division of the AFL-CIO, the National Alliance of Businessmen, the Department of Labor, and RADET. The conference included orientation and definition of the mission of the Buddy Project and a general review of factors necessary for successful coordination and liaison with all involved in the project.

The five selected cities were: Newark, New Jersey, Portland, Oregon, Houston, Texas, Cleveland, Ohio, and Milwaukee, Wisconsin.

Plans were made at the June 24-25 conference for a briefing session to be held in Washington, D. C. July 1 and 2 which would include all those who would play positive roles in the Buddy Project - Department of Labor, National Alliance of Businessmen, AFL-CIO, RADET, and Greenleigh staff assigned to the project.

The July 1 and 2 agenda followed the pattern below:

July 1

10:00 - 10:30 - Welcome and Introduction - Leo Perlis - AFL-CIO

10:30 - 11:15 - Background of National Alliance of Businessmen - John W. Livingston

11:15 - 11:45 - Pledges and Contracts - Tom Royals, Deputy Assistant Manpower Administrator - Department of Labor

12:00 - 2:00 - Luncheon

2:00 - 4:00 - Role of Greenleigh Associates - Jules Pagano, Vice President
Mrs. Martha Reynolds - Labor Coordinator
Jack Williams - Labor Coordinator

July 2

10:00 - 11:00 - Buddy Training - RADET Corporation - Dr. Charles Dailey, President

11:00 - 12:00 - Role of Community Services Representatives - William A. Davies, CSA Training Director

Role of Labor Liaisons to National Alliance of Businessmen and Central Body Officers - Leo Perlis, John W. Livingston

12:00 - 2:00 - Lunch

2:00 - 3:00 - Questions and Summary - Leo Perlis

Some of the highlights of the July 1 and 2 conference:

1) Comments by Leo Perlis, Department of Community Services, AFL-CIO, Tom Royals, Deputy Assistant Manpower Administrator, Department of Labor, Charles Dailey, President, RADET, William Davies, AFL-CIO Community Services Activity Training Director, concerning what should be expected of their respective offices.

2) Jules Pagano commented on the responsibilities of Greenleigh staff and introduced two labor coordinators - Mrs. Martha Reynolds and Mr. Jack Williams who would be staff coordinators for Greenleigh with major responsibility in the field.

3) It was decided, after a thorough review of the program in Newark, New Jersey by the Labor representatives there, that because of that community's labor movement situations and current developments it should be omitted as a pilot city.

4) Tentative schedules were established for the four other cities and work schedules outlined for Greenleigh staff.

5) A sub-committee was established to determine a fifth city since Newark was deleted. (Atlanta, Georgia appears to be the city. The field visit is July 11 and 12)

The Procedure and Schedule is Listed Below:

During the two orientation and planning sessions mentioned here, key representatives from all five participating organizations discussed the most effective ways of insuring coordination and cooperation. Out of the discussions came an understanding for staffing the project in each pilot city (see attached list of representatives). The local AFL-CIO Community Services representative will serve as administrator for the city project; the labor liaison representatives as policy advisors in contact with the labor movement and consultants in the organization of the program; the senior consultant as expeditor, consultant and assistant to the administrator; the coordinator as direct liaison with the national project, organizations, and experiences of other pilot cities; and the Metro Director as liaison and assistant in contact with cooperating employers.

The AFL-CIO, its national community services department, the Greenleigh staff and consultants, the National Alliance of Businessmen, the Central Labor Bodies, and the local community services representatives will work towards insuring acceptance of the Buddy System by the labor movement, assisting in the community orientation program, and providing guidance in the selection and training of the Buddies.

In four of the five pilot cities, (Milwaukee, Houston, Portland, and Atlanta), the field team will begin functioning during the week of July 8.

A guide for possible procedure and schedule discussed during the above mentioned orientation conferences and in a subsequent meeting of organization follows:

(1) 1. July 8 - 15 - Contact leadership group necessary to select companies and unions to be involved in the project.

2. July 15 - 22 - Hold "Backgrounder" Session to acquaint all labor management and community leadership who must understand the proposed Buddy System. Begin recruitment of Buddies.

The Greenleigh staff will arrange the recruitment of the Buddies through the Central Labor Council representatives and the Community Services staff representatives. During these recruiting exercises the staff will also work very closely with the responsible management, government, and other related labor representatives.

3. July 22 29 - Complete recruitment of Buddies. Hold their orientation sessions. Possibly hold the two-day training session.

The training for the Buddies will be provided by RADET, however, Greenleigh will be responsible to coordinate and monitor the various inputs into the training program.

4. July 29 -August 5 - Two-day training program completed and the Buddy System begins.

5. August 5 - September 9 - Assist Buddies in their functions.

6. September 9 - September 23 - Evaluation.

The other pilot cities will experience a later start. Cleveland was not represented at the AFL-CIO orientation meeting on July 1 and 2. A group from the national offices of the cooperating agencies will hold an orientation and planning session with the Cleveland local team on July 17 and 18.

Mr. Jack Livingston's Report

JUL 19 1969

THE BUDDY SYSTEM

One of the most difficult periods for a new employee is his or her first days at work. Fitting into the company routine, finding the way around the plant or office, timing the coffee and lunch breaks, discovering the best bus route or fitting into a carpool and, above all, learning the new job, are critical issues in job adjustment. This is the make-or-break time, and even for people with extensive work experience it is a trying time. How much more difficult this period is for a person with little or no work experience and especially a disadvantaged hard-core worker.

In order to assist the new employees in this job adjustment, the NAB, AFL-CIO Community Services Dept. and the Department of Labor are developing a program for older rank-and-file workers to be Buddies to the newly hired disadvantaged.

The Buddy system is one facet of the total JOBS program designed to train and provide steady employment for the country's hard-core unemployed. In support of that broad objective, the Buddy system was conceived in order to assist recruits in acclimating themselves to their new work environment through the counseling and

guidance of co-workers or peers. In the past, Buddy programs have been found successful in similar applications and it is expected that assigning a man, experienced in shop routines and workday problems, to assist each hard-core recruit should contribute significantly to keeping the disadvantaged permanently employed.

Two consulting firms have been contracted by the Department of Labor to implement a pilot Buddy system in five selected cities. Greenleigh and Associates with the aid of the AFL-CIO Community Services Department and in conjunction with each city's central body and the NAB Metro officials are to organize and coordinate the project. The RADET Corporation will design and conduct workshops for training Buddies in their role as advisors. Both consultants will work together closely to implement the overall system and to evaluate the effectiveness of the pilot project.

The five test cities selected are: Atlanta, Georgia - Cleveland, Ohio - Milwaukee, Wisconsin - Houston, Texas - and Portland, Oregon.

Meetings of local labor and management leaders are now taking place in these cities for the purpose of gaining program acceptance and support. Selection of Buddy trainees, establishment of training schedules.

The broad objectives of the training program are:

a. Obtain acceptance of the Buddy role, and develop at least an elementary skill in carrying out that role in handling the various problem situations likely to arise in the Buddy's relationships with the newly hired person;

b. Develop skill in dealing with the Buddy's co-workers when such problem situtations involve this "peer group"; and

c. Develop skill in dealing with the Buddy's problems that may require the services of Community Social Agencies.

Each workshop will prepare from 9 to 21 trainees over a period of 16 hours (one and a half days.) The methods of training will draw from techniques familiar in adult education and industrial training: those, such a role playing, which involves the participant in relevant activity rather than in purely passive listening; and those techniques which place the trainee in situations similar to those which he is likely to encounter on the job. In most cases, the training can help the trainee see that there are several possible ways of reacting constructively to a given situation likely to arise within the shop. The training can also help him see which ways of reacting are destructive.

The trainer will return to each city within three weeks for a brief refresher meeting with the trainees. The value of this follow-up meeting is greatest for those Buddies who have been assigned a disadvantaged worker since the completing of the workshop.

The RADET Corporation will attempt to assess the success of the training program by a visit to each city within a short period following the workshop for individual interviews with each trainee, his supervisor, and the disadvantaged worker assigned to the Buddy training. During these interviews, the investigator will collect the data necessary to determine the impact of training, the degree to which the trainee has carried out the Buddy role, and the effects on the newly hired disadvantaged worker.

The final evaluation and report of each consultant will recommend measures which can be invoked to increase the overall effectiveness of the system and to streamline its implementation in additional cities.

1. The training outline should be finished this week - July 15-20.

2. We expect training sessions to begin the last week of this month (July) or the first week in August. Training sessions should be completed by September 10.

3. We are hopeful that a well rounded Buddy training program - in the most simplified form possible - can be developed to be used in other cities.

4. We are hopeful of using the revised HDI film in our Buddy Training Program.

###

GUIDELINES FOR SELECTING "BUDDIES"

Prepared for Buddy Orientation Meeting
Wednesday, August 7, 1968
Milwaukee-Waukesha-Ozaukee Chapter American Red Cross

The Buddy System of the AFL-CIO Community Services Committee is an experiment, and as such, will need to develop guidelines for future, similar programs.

All of us involved including the union and the company, will need to cooperate and coordinate our efforts on behalf of the hard-core employee to assure success of the project.

We need to recognize from the beginning that the buddy selected will need special characteristics to gain acceptance and stature in the program. As we have not had an opportunity to draw from other experiences and evaluate those experiences we suggest for your consideration, the following guidelines for selection of buddies.

As this is a union program, it is obvious that the buddy must be a union member and should have some work experience in the department chosen for the experiment.

Remember, these are guidelines and that each person selected as a buddy may vary in personality, but in our opinion the buddy needs special ability to make the hard-core employee's work experience meaningful for him and produce a fruitful employee and citizen at the conclusion of the program.

1. A buddy should be able to establish rapport with people in the department. (steward, foremen, union officers, fellow workers.)

2. He must have knowledge of company rules and labor agreement - including safety rules.

3. In order to help the trainee in adapting to the working group, the buddy must have knowledge of accepted practices in the department (plant collections, birthday observances, clubs, coffee pools, etc.)

4. It is not expected that a selected buddy will be familiar with all community resources, but he must indicate a willingness to learn about and use such agencies to meet problems encountered in assisting the trainee.

5. Many of the hard-core unemployed have basic problems of health, behavior, alcoholism, or poor work habits. The buddy, therefore, must be someone who can be a stable influence to assist in overcoming these problems.

6. Though it is understood that the buddies must at times seek special information and help in solving a trainee's problem, the assurance of confidentiality is a basic need. No trainee should ever be made to feel that his personal problems are being discussed within the department or plant.

Other factors such as race, sex, residence and age must be given careful consideration even though they are not absolute criteria. Each of these must be discussed in determining the compatability of the buddy and the trainee. The buddy must be a basically warm human being with a knowledge of, and compassion for, the disadvantaged person with whom he will be working.

Buddy Project Informational Memorandum No. 2

From Jules Pagano, Project Director

The ~~four-~~week period since the date of the last inter-personnel memorandum has witnessed considerable progress in formulating and implementing plans for the Buddy System Project.

The earlier part of the month was spent in each city contacting NAB industries and counterpart trade union local officers, and orienting the communities to this project. Numerous meetings were held in each city briefing the companies and unions as well as community service agencies concerning the project. The agendas varied from exploration for cooperation to detailed establishment and commitments for Buddies in given plants. On the average, twenty (20) industries were contacted in each city and a like number of local unions. Attached is a detailed list of companies and unions in each of the cities which, as of 8 August, have agreed to participate in the Buddy System. Also attached is a list of contacts and representatives in Atlanta, Georgia for your information. Following are city logs and schedules for the Buddy System Programs in each city.

A number of conferences were held in Washington, D.C. with Tom Royals and his staff of the Manpower Administration Division of the Department of Labor, to report progress and to implement coordination between NAB, AFL-CIO's Community Service staff, RADET, and Greenleigh Associates. The meetings have allowed Greenleigh to coordinate and implement unity and continuity with the training corporation - RADET - as well as making possible the full support of the AFL-CIO in implementing this program at all NAB levels, national and urban.

Herewith quoted in its entirety is a letter circulated to all Metro Directors (in each of the five pilot cities) by Mr. Leo Beebe, Executive Vice Chairman of NAB.

> "One of the most difficult periods for a new employee is his or her first days at work. Fitting into the company routine, finding his way around the plant or office, timing the coffee and lunch breaks, discovering the best bus route or fitting into a carpool and, above all, learning the new job, are critical issues in job adjustment. In order to assist the new employees in this job adjustment, the NAB, the AFL-CIO Community Services Department, and the Department of Labor are developing a program for older rank-and-file workers to be 'Buddies' to the newly-hired disadvantaged.
>
> "The pilot 'Buddy' training program will be implemented in five test cities during August and September, 1968 by Greenleigh Associates and RADET Corporation in cooperation with the AFL-CIO Community Services Department. _____ is one of the cities selected. Success in the pilot training program will definitely be an asset to the NAB goals. Representatives of these organizations have, or will soon be, in contact with your office for advice and assistance. A word of encouragement from you to the companies being asked to participate in the 'Buddy' program will do much to achieve our objectives.
>
> "If you have any questions, feel free to call our Union Relations Director, John Livingston (202 - 395-4602)."

LOGS AND SCHEDULES

City	Community Orientation	Buddy Training
Atlanta	21 August	26-27 August
Cleveland	25 August	29-30 August
Houston	26 July	15-16 August
Milwaukee	7 August	21-22 August
Portland	6 August	8-9 August

The patterns of Buddy Orientation vary from city to city. However, in all situations will take place prior to training. In some situations, orientation will be on a plant-by-plant basis, in others, combinations of Buddies from various plants, and in still others, on the basis of individual briefings.

OBSERVATIONS AND COMMENTS

While there are many local problems that need solutions based on local traditions, relationships, and labor relations agreements, real progress is being made in establishing a Buddy System in each of the five pilot cities. Each city is at a different stage of development. The reality of the situation in all cities is requiring a great deal of local definition both as to the role of the Buddies as well as the procedure in developing the support necessary for them to function effectively during this experimental period. The following specific difficulties encountered and/or observations are a compilation of reports from each of the five cities - they should prove valuable to each of you.

1. It was discovered that some hand-out material would be useful during information meetings.
2. It was discovered that in order to avoid confusion, the team needs more information concerning other training and employment programs being conducted in industry.
3. It is felt that in each community there be no publicity (at least until the training is completed), to avoid the focus of attention and pressure on the new employee or buddy.
4. The following comments were observed regarding the success of the Program vis a vis inter-relationships between labor, management and the hard-core employee:
    a. The NAB Metro Director and his staff must accept the Buddy System Program and provide cooperation, information and/or support when requested.
    b. The local labor movement's leadership must not only accept but also give leadership to the program.
    c. The local union leaders in the collective bargaining unit must accept and support the Buddy System Project.
    d. The international staff representative service in the local union must at least permit the program to proceed.

e. The company must be a NAB participant in the recruitment of hard-core employees for regular employment.

f. The hard-core employee must be employeed in the collective bargaining unit.

g. The position to which a hard-core employee will be assigned must be predictable (i.e.: the department, the job and its specific location must be known).

h. The local union leadership must be able to recruit potentially satisfactory buddies.

i. The company must accept the union's role in implementing the Buddy System.

j. The company must adopt or permit necessary procedures to make it possible for the buddy to function.

5. Should the Buddy System Project prove unsuccessful in any of the five pilot cities, the effort involved would not have been in vain. In some cases, the contacts (indeed, rapport) which have been established between union leaders and management, and their awakening to the reality of the crucial issue involved certainly would have been well worth our involvement.

6. In most cases, there has heretofore been no systematic program of recruitment, training and placement of the hard-core unemployed. Employers are often reticent when quiered regarding the issue; probing has shown that one of two situations may exist: 1) no effort has been made in the area of hard-core employment; or b) the firm operates under the delusion that subdued, unpublicized efforts should be made.

7. Some union representatives felt that the RADET training materials should deal with employee relationships, personal thoughtlessness or insecurity and union relationships rather than with the problems of production concerned with supervision as stressed in the demonstration cases now in use.

CONCLUSION

It is crucial that during this month, the general staff involved think seriously about progress and experience to date. Reports (preferably weekly or bi-weekly) should reflect not only insights and observations concerning the implementation of the Buddy System, but should in addition detail and define the rational taking place at local levels in the selection of buddies, as well as criteria developed in the process. Also to be included are observations regarding buddy, employer and union reaction to the training experience.

The essence of your reports will be made available (as will this memorandum) to concerned NAB, AFL-CIO and Department of Labor officials in Washington, D.C., and through bi-weekly memorandums to all key personnel in each of the five cities which are working with us.

ROUGH DRAFT

Buddy Training

Building work-group support
for the newly recruited disadvantaged
worker in the JOBS program.
The RADET Corporation

In brief, the Contractor will develop, implement, and evaluate a program for training buddies to support and assist disadvantaged persons hired under the JOBS program. This program is to be carried out in five cities, determined by the Manpower Administrator, U.S. Department of Labor, or his designee. The dates will be chosen from among those made available by the Contractor. In general, the training dates will consist of two or three day periods after July 15. Whether two days or three, each training program will require eighteen hours.

Statement of work to be done

The training program development includes "Design" and "orientation." The Design of the program implies setting objectives for the training, choosing methods for doing the training, and finding Trainers to carry out the program. Orientation implies participating in the one-halfday Orientation programs being organized by Greenleigh Associates. There are five such programs. They will be held in the five cities designated by the Department of Labor, on dates agreed upon by Greenleigh and the Contractor.

Implementation implies that the Contractor will select the Trainers, orient them, and conduct the 18 hour Workshops in the five cities selected; and that he will arrange a brief "follow-up" or refresher session within a few days after each such Workshop.

Evaluation includes the collection of field data to measure the impact of the training, and the evaluation of impact; it also includes the preparation of a final report. The final report will contain five copies of a "prototype" training program. The prototype program is a set of instructions for a Trainer, with copies of the

materials actually used in the training. The Trainer's instructions will be sufficient to allow a professional trainer (whose qualifications will be indicated in the Evaluation part of the final report) to put on the program.

Phases of Work

The work is divided into the following phases:

1. Design (estimated completion date: July 15)
2. Orientation (estimated completion date of last orientation depends on Greenleigh)
3. Implementation (estimated completion date: two weeks after completion of last Orientation)
4. Follow-up (est. compl. date: two weeks after completion of last Workshop)
5. Evaluation (est. date of rough Report, October 15; of final report, November 30, 1968).

Overall purposes and objectives

Groups of Buddies (9-21 is the size of each of the five Workshops) will be trained to anticipate and deal with the various critical on the job problems faced by newly recruited disadvantaged workers. The overall purpose of the training program is to make the Buddy system effective. The overall purpose of the Buddy system is to make it more likely that the JOBS program will be effective. Thus, the Buddy training is a "sub-system" of the Buddy system, which is in turn designed to make the JOBS program meet its economic and social aims.

There are three objectives in the Buddy training program:

1. Obtain acceptance of the Buddy role, and develop at least an elementary skill in carrying out that role, in handling the various problem situations likely to arise in the Buddy's relationships with the newly hired person;
2. Develop skill in dealing with the Buddy's co-workers when such problem situations involve this "peer group;"
3. Develop skill in dealing with the Buddy's supervisor and shop steward when the problem situations involve them.

Each of these Objectives in turn implies Sub-objectives, as shown below:

1. Obtain acceptance of the Buddy Role...	1.1 To explain the role of Buddy
	1.2 To help him see his personal stake in the Role
	1.3 To arouse his willingness to take the risks involved in this Role
	1.4 To develop an understanding of the situation confronting workers new on a job
	1.5 To develop an understanding of the situation confronting disadvantaged workers
	1.6 To help the trainee see various ways in which each problem situation can be constructively handled.
2. To develop skill in working with the Buddy's "peer group"....	2.1 To develop an understanding of the way "informal workgroups" use their power
	2.2 To help the trainee see various ways in which he can deal with "peer power"
3. To develop skill in working with the supervisor and the shop steward...	3.1 To develop an understanding of the way foremen and stewards react to new workers and disadvantaged workers
	3.2 To help the trainee see various ways in which a Buddy can deal with the Foremen and the Shop Steward.

Note: in non-unionized companies and other circumstances, substitute the appropriate terms for "Foreman" and "Shop Steward."

Design of the Program

The Program Design essentially consists of the role playing and other exercises and training materials which will be used during the 18 hours, to achieve the above objectives. The Design also requires a rapid build-up of information about the kinds of persons who are likely to be recruited for the Buddy role and training. For example, will the Buddy be drawn from that part of our society -- the "blue collar", lower-income white groups who are most threatened

by minority group demonstrations, housing drives, and educational demands? A training program effective with such Buddies would be quite different in content than one directed toward Buddies who were selected because of their high seniority and lack of antipathy toward minority groups.

Philosophy of training. Our methods of training seek specific changes in human behaavior, but we try to avoid the mechanical assumptions implicit in programed instruction and similar training procedures. We stress the relationship between Trainer and Trainee -- as opposed to "getting through the agenda."

This means that we will try to define the sub-objectives listed earlier (page 3) in terms of specific behavior, so that we can determine whether the training has been effective. But we will emphasize the necessity for the Buddy to make his own decision about his commitment to the role.

The methods of training will draw from techniques familiar in adult education and industrial training: those, such as role playing, which involve the participant in relevant activity, rather than in purely passive listening; and those techniques which place the trainee in situations similar to those which he is likely to encounter on the job.

Problem situations. Role playing and other training exercises will be built around such problem situations as those listed on the following page. Our research to date has led us to expect that these kinds of problems will frequently arise in the Buddy system. The question for each problem situation is, "What can the Buddy do to help?" In some of them, the answer may well be, "Nothing." In others, he may be able to take a very active role. In most cases, the training can help the trainee see that there are several possible ways of reacting constructively to a given situation. The training can also help him see which ways of reacting are destructive.

Tentatively, the problem situations involved in the Training Program will include:

1. The New Worker fails to show up for work.
2. The Worker shows up with a hangover and wants to take a drink on the job.
3. The Worker wants to borrow money from other workers.
4. The Worker does an outstanding job but the Foreman fails to notice it.
5. Lunchtime comes, and none of the other workers sits down for a sandwich with the New Worker.
6. The Worker doesn't want to follow the safety rules.
7. The Worker does very poorly on the job.
8. The Buddy takes the New Worker to the coffee counter and finds that his coworkers avoid both of them.
9. The Worker shows up in shabby clothes and one of the co-workers ridicules him.
10. The Worker wears a funny-looking haircut and the Foreman tells him to change it.
11. The Worker's ghetto buddies show up and hang around the place of work, every day around quitting time.
12. A Foreman puts pressure on the Buddy to do something which he thinks will make the Worker fail.
13. The company gives the New Worker a hard assignment or promotion for which he is not ready, with the obvious intention of making him fail.
14. The Quality Control inspector starts rejecting the work of the New Worker, by applying tighter standards than he uses with other people.
15. The Personnel Department tells a New Worker he will have to take a test, but the Buddy knows the Worker is afraid the others will find out he can't read.

In each such Problem Situation, a short description of the roles involved is part of the Trainer's instruction manual. In these roles (when they are considered together), the situation is described in much greater detail than above.

Arrangements for training. The training schedule will be worked out with the Greenleigh Asso ciates, as will the choice of a training site. The site must be such as to permit the kind of training and the methods described above.

Orientation

The orientation sessions will be scheduled in coordination with Greenleigh Associates. The Contractor's part of each of the half day orientations will be the description and explanation of the Buddy training program.

Implementation

Following each Orientation workshop, after Greenleigh Associates notify us that the Buddies have been recruited and are available for training on a specific date, the Contractor will schedule a Workshop. The Contractor will select the training site.

It is understood that this will be done only after Greenleigh Associates can give assurance that the Buddies (9-21 for each Workshop) have been given "released time" by their companies, and that the Buddies have agreed to appear for the training.

We will then schedule one of our Trainers, provide the materials, and conduct the training. At that time, we will collect certain data to be used later in evaluating the effectiveness of the training.

We, The Contractor, are in complete charge of the training. In our philosophy of training, the trainees must feel completely free to participate. Any authority to visit or observe must be obtained from the Trainer. Participation of observers will be regulated by the Trainer.

The program will require about 18 hours in a block of time. This means that the trainees must not intermittently return to the job. The program may be given in two or three days. It may be scheduled during the working week, on the weekend, or with any combination.

Follow-up

The Trainer will return to each city within three weeks for a brief "refresher" meeting with the trainees. This follow-up meeting does not require released time unless some of the trainees are working on the evening shift. When the

Buddies are originally invited through Greenleigh Associates to participate in the three day Workshop, the Follow-up date should also be scheduled at that time. This date must be acceptable to the Trainer.

The value of the Follow-up meeting is greatest for those Buddies who have been assigned a Disadvantaged Worker since the completion of theWorkshop. It is possible in some cities that Greenleigh Associates will conclude that such a Workshop Follow-up will not be useful, but it will be the Trainer's option as to whether to conduct it.

Evaluation

A Field investigator from the Contractor will visit each city within four to five weeks following the Workshop, for individual interviews with each trainee, his Supervisor, the disadvantaged worker assigned to the Buddy trainee, and possibly other peers of the worker. The Field investigator will talk to the Shop Steward if it is feasible.

In this interview, the Contractor will collect the data necessary to determine the impact of training, the degree to which the trainee has carried out the Buddy role, and the effects on the newly hired disadvantaged worker. The interview will be of the open-ended type in the main.

The findings of the interview will be held completely confidential. They will be encoded to determine which of the sub-objectives of training (see page 3) have been best achieved, and under what circumstances the training program appears to have obtained its best results. With the aid of this analysis, the less productive units of the training will be removed, and an improved design produced.

In addition to the Field interview, certain impressions are collected during the training from the Trainer, Trainees, and any observers who may be present. These impressions should

be collected in such a way as to answer the following questions about whether an effective climate for learning has been established in the particular Workshop:

-- does each trainee feel free to participate to the fullest extent practical?

-- does each trainee "identify" himself with the trainer as a human being?

-- has the trainee group formed a sense of unity (or "we-feeling")?

-- do the trainees feel <u>involved</u> in the training -- do they consider that they are learning something which affects their vital interests?

A third type of question involved in the Evaluation is the cost-effectiveness of the training. It is true that a program under development cannot meet the same cost standards other programs do. However, we can state that the standard costs we visualize for the program whose prototype we are going to produce, as the end-result of the evaluation, will lie somewhere between University undergraduate instruction costs and management training costs.

Cost standards set without any reference to effectiveness are, however, dangerous. In our final report, we will relate the cost estimates of the Prototype program to the evidence of Effectiveness.

The Evaluation -- especially the Field Investigators' reports -- will produce evidence of the operation of the Buddy System itself. We will incorporate this evidence in our Final Report.

Finally, in the Evaluation report, we will include the training program as re-designed in the light of the Evaluation. This new training program will be in the form of an instructor's manual, ready for use.

GUIDELINE TO AFL-CIO-CSA SPECIAL UNION COUNSELOR BUDDY PROGRAM

I. Initial briefing session on Buddy Program by CSA for

1. CLU presidents
2. CLU-NAB liaison
3. CSA staff

in Washington to

1. explain background of program
2. intent and extent of business commitment
3. mechanics

utilizing resources of

1. Labor Department
2. NAB
3. CSA

II. One-day orientation in community - labor, management and social agencies recruitment of union members for attendance to be done by local CSA staffers

III. Assessment and listing of plants in each community by Greenleigh Associates in cooperation with NAB of designated job slots and department locations for purposes of recruiting special union counselors as buddies.

IV. Advance determination of composition of job trainees regarding color, sex, ethnic background, residence for purposes of recruiting special union counselors by Greenleigh Associates through SES or CEP.

V. Recruitment of special union counselors according to plant and department location through local union channels, with special attention given to recruitment <u>of</u> and <u>by</u> trained union counselors to be done by Greenleigh Associates in cooperation with local CSA staffers.

VI. Training of special union counselors by RADET Inc. and local CSA staffers

A. Alternative training structures

1. Weekend training ($2\frac{1}{2}$ days) beginning Friday evening through Sunday afternoon

2. Afternoon sessions on company time

3. Evening sessions during week nights

B. General content of training program

1. explain background of program

2. intent and extent of business and labor commitment

3. mechanics and finances of program

4. philosophy of what it means to be a buddy (and socially - cautions)

5. psychology of the hard core unemployed and sociology of poverty

6. kinds of problems youth has experienced

7. this job as seen through eyes of trainee

8. how does buddy operate and what is expected of him

9. how to handle problems which arise -

examples of problems backed up by cases in other OJT programs

10. how to greet trainee; job-related information such as breaks, lunch, pay periods, credit union

11. introductions to some of the men to steward

12. union structure, union meetings

13. out-of-plant problems and resources

14. summary and quations and answers

15. challenge to commitment by CLU president

VII. Follow-up

A. Group sessions of trainees conducted by CSA and Greenleigh Associates.

B. Group sessions of special union counselors conducted by CSA staff.

REVISED

THE "BUDDY" SYSTEM

The opportunity for employment was one of the primary needs pointed out in studies of the recent civil disorders in our cities. To meet this basic need, businesses, through the National Alliance of Businessmen (NAB), have entered into a partnership with the U. S. Department of Labor to hire and train the hard-core unemployed for permanent meaningful jobs.

In fifty cities throughout the country where this program is meeting with initial success, employers have found that many of the new trainees have lasted on the job for only a few weeks. They are unaccustomed to reporting on time or coming to work every day, and find it difficult to accept other customs which are standard business practice. The feeling of estrangement is often intensified by the new worker's belief that there is no one within the system with whom he can talk and relate freely.

Recognizing the fact that the success of the campaign to hire the hard-core unemployed depends upon their retention, the National AFL-CIO Community Services Department has designed a new program called the "Buddy System" to assist these new employees in adjusting themselves to their work environment through the counselling and guidance of specially trained co-workers on a person-to-person basis.

In five cities pilot programs are being developed in which there are well-organized plants participating in the NAB employment program. These cities are Milwaukee, Wisconsin; Houston, Texas; Cleveland, Ohio; Portland, Oregon; and Atlanta, Georgia.

As an experimental demonstration, each city will select and train 20-25 special counselor "buddies" who will assist the hard-core employee in;

1) adjusting to plant routine and job requirements;
2) obtaining aid and assistance as needed from community health, welfare, recreational, educational facilities and resources;
3) establishing good working relationships with fellow employees, and coping with problems which might arise.

The local AFL-CIO community services representatives will serve as project administrators in each city. The central labor body, liaison representatives with NAB, will serve as policy advisors in contact with the labor movement. Consultation and coordination will be provided by National AFL-CIO representatives and educators assigned to Greenleigh Associates. Volunteer "buddies" in each of the demonstration plants will be selected and recruited by the participating local union. An 18-hour training session for the 20-25 volunteer "buddies" in the project will be conducted by RADET Corporation (Research Analysis Development Education Training).

The three-month demonstration program will be studied and evaluated by RADET and Greenleigh. If successful, it will be offered to the other fifty cities participating in the NAB program.

Expenses

8/24/ —

Dinner — 2.00

8/25 Breakfast 1.30

Personnel director said in front of man (to buddy) up to you whether we hire —

Sears —

15th day back, challenged for absence —
actual fight w. old worker, usually worked with him
(kept quiet)

new worker — 19yrs old — 2 days 1968 auto
(1) also worked at plating co. (3) —
(2) ex-Lockheed — Said he did a-k. — complaint
against Lockheed for racial firing —
how find Scripto — just "saw" big plant —
seemed militant —
gave look at plating dept. —
to return mon., w. work clothes —
worked well until break, & most of the day —
(Buddy works out of adjoining dept.)
asked about C.U., & insurance

7 mos. in Training program
didn't "like" foreman —
he was 3 yrs
fired of 9 trained out of 36 trainees —

excuse for each job "quit" has been

2nd worker 2½ weeks — (Richard Kisby(?))
50 yrs. old, illiterate (Perhaps only real hard case of the 3 hired)
2nd Shift — Coleman Lynn is buddy —
hired when union people laid off, but
K does not seem to care —
light work — needs to read
Coleman Teaching enough to recognize types of materials (Containers)

3rd 53 yrs old — but always employed —
fired 10 yrs ago for drinking — knows old hands —
about 4 weeks at work —

Austin —

10 days, no problem, no tardy, no absence
worked 3 yrs at St. Regis —
said he was shipping clerk when he quit —
16 miles to work & car went to pieces —
30 yrs old — J. P. Ross

broke safety rule — thanked buddy for correction
perhaps just elementary education
gets along o.k. —
through Empl. Service, then to company, —

Charles Evans —
Some resentment as to why he was picked
to be buddy — 3 people considered —
no worker yet —
Some mix up (Martha R.) about who was
going to ~~be~~ 'lend' the worker.
but they have hired 6-7 new people who
Evans thinks might have been considered
hard core —

Pope

hired on 16th —

Came on Monday night

19 yrs old, never a regular job, hired off "the street"

no shows Tues —, Wed, Thur — Fri.

called said mother sick

No call

called phone #, evidently the wrong number given —

address didn't have apt # — Henry visited at home — in bed w. measles —

football coach at Archer sent him over —

H.S. drop out —

after visit of Buddy he did call in —

Scored on Test 35 —

~~Henry~~ Henry doesn't consider hard work —

thinks he'll make it —

Now at Sherwin-Wms

thinks 2-3 weeks will hit —

Hubbard

~~20~~ 20-22 yrs old — 2 yr old child — through empl. serv.

4 days on job —

short menu, jewelry —

buddy fast and approach —

"united" the races — all loath her

big mouth w. foot in

"sews wonderfully" — "draws beautifully" —

Buddy suggested

breaks — "they listen" — breaks are by

depts. not racial

foreladies on vacation when hired

so assignments came ~~by~~ from buddy —

low seniority meant less desirable jobs

(but these shared by buddy who is 2nd lowest

in seniority)

Introduced to some other young people in

plant —

Dear Mr. Vial

At Professor Chalmers' request I am sending this note along to each of you thanking you for your attendance at the Conference last Saturday and Sunday, June 14 and 15.

I have sent your expense reports on to the travel office here at the University. You may expect to receive your expense check in the amount of $ 98.10 on or about the first of July. The checks are mailed out at the end of the month.

If you do not receive your check at this time, please give me a call at 764-9477. (Collect, of course).

Thank you.

Sincerely,

Florida M. Andrews

Mr. Jerome T. Barrett
Assistant Director
National Center for Dispute Settlement
of the American Arbitration Association
1819 H Street, N. W., Suite 350
Washington, D. C. 20006

Dear Mr. Barrett:

Thanks for your letter directed to members of AFT Local 189. The truth is I had meant to be in touch with the Center for reasons that go well beyond my interest as an AFT member.

I would like to receive any other publications of the Center and to be added to your mailing list.

Under separate cover I am sending you a number of publications of the Southern Regional Council. Some of these will simply give you an idea of the range of our interest but other I think you will find may serve to provide rather specific background information in areas of interest to the Center.

I hope if anyone from the Washington staff is traveling through Atlanta they will take the opportunity to stop by our offices. If there is any way we can be

of assistance please call on us.

Would you be so good as to give my regards to Bill Abner whom I had hoped to see last month in Detroit at a meeting called by Bill Chalmers. Abner may recall that I was on the faculty of Roosevelt University when he was in Chicago.

Sincerely,

Emory F. Via
Director

5 Forsyth Street, N. W.
Atlanta, Georgia 30303

Dear Mr. Via:

The enclosed brochures provide information about the National Center for Dispute Settlement. The Center is involved in the settlement of three types of disputes -- community, campus and public employment.

As a member of Local 189 working in a state which lacks a comprehensive public employment statute, you may be interested in the activities of the Center in public employment. If your teaching activities involves public employee unions, you should be particularly interested in the Centers availability to provide mediators, arbitrators and fact-finders to help resolve the three major dispute areas in public employment labor relations, ie., representation questions, bargaining impasses and grievance settlement.

American Arbitration Association Officers:

J. Victor Herd, Chairman • **Donald B. Straus,** President

Robert Coulson, Executive Vice President • **Gerald Aksen,** General Counsel • **Howard M. Holtzman,** Chr., Exec. Comm.

If I can provide you with any additional information about the Center, please call me.

Sincerely,

Jerome T. Barrett

Dear Mr. Via:

The enclosed Memorandum is being sent to you because Atlanta is one of the 15 cities being considered as a good place to have some mediation and arbitration training conducted. Because of your connections in Atlanta and your experience in education, I thought you might be able to suggest someone in your area who might be interested in this project.

If you do know of someone, please let me know.

Sincerely yours

MEMORANDUM

To: Selected Members of the Public Employment Dispute Settlement Panel

From: Jerome T. Barrett JB

As a member of the Public Employment Dispute Settlement Panel of the National Center for Dispute Settlement, you are probably aware of the Center's interest in disputes other than those in public employment. You may have heard of the Community Dispute Settlement Panel which the Center is developing for use in the settlement of all types of community disputes including landlord-tenant, consumer-merchant, police-community, school-community and others.

In carrying out the Center's role of promoting the use of mediation and arbitration in community and other disputes, we have conducted a number of classes and seminars to train potential mediators and arbitrators. To expand the impact of this training effort, the Center is now considering the idea of conducting a conference in Washington, D. C., this winter to provide training for individuals who are interested in training mediators and arbitrators for community disputes. The conferees would be chosen from approximately 15 metropolitan areas on the basis of their interest in and ability to organize and conduct courses in their local area to train potential neutrals. We believe that the potential conferees are persons (1) who have organizational connections which will make it possible for them to sponsor training in their local community; (2) who have a genuine belief in the Center's work of promoting the use of mediation and arbitration to resolve community disputes; and (3) who would be willing to continue to work with the Center in developing

American Arbitration Association Officers:

J. Victor Herd, Chairman • **Donald B. Straus**, President

Robert Coulson, Executive Vice President • **Gerald Aksen**, General Counsel • **Howard M. Holtzman**, Chr., Exec. Comm.

neutrals and promoting the settlement of disputes through mediation and arbitration. These potential conferees are probably persons who are currently on urban university faculties in the department of urban affairs or social work, or persons affiliated with community organizations, bar associations or other civic groups.

Since your area is one of the 15 being considered, I would appreciate your suggestion as to who might be a good prospect in your community for attending such a conference. Since I realize that you are busy with many other things, I don't want you to take the time to check out the individual's interest in such a project. If you would merely give me the name and address of the individual(s), I will contact them myself.

I will very much appreciate any help that you can give me on this matter.

October 20, 1969

Mr. Jerome T. Barrett
National Center for Dispute Settlement
of the American Arbitration Association
1819 H Street, N. W., Suite 350
Washington, D. C. 20006

Dear Mr. Barrett:

I am writing in response to your letter of October 9 regarding persons who might cooperate in a mediation training session for Community Disputes Settlement.

For the most part the men I will suggest probably could not take the time to be the local director of such a training program but in each case I think they would be cooperative. They are:

Dr. John Griffin, Executive Director, Southern Education Foundation, 811 Cypress St., N.E., Atlanta, Georgia 30309.
Dr. Griffin is a member of the AAA Panel of Arbitrators and was formerly with the Community Relations Service.

Dr. Vivian Henderson, President, Clark College, Atlanta, Georgia 30314.
Dr. Henderson's academic training is as a manpower economist.

Professor George Savage King, Law School, Emory University, Atlanta, Georgia.
Professor King is also on the AAA Panel.

Mr. Al Marshall.
Mr. Marshall is recently retired from Georgia Tech, is on the AAA Panel, and possibly could have time on his hands. I do not know Mr. Marshall personally.

Dr. James Crawford, Chairman, Economics Department, Georgia State University, Atlanta, Georgia.
Mr. Crawford's training is in the field of labor economics.

I also would be happy to cooperate in any other way that would prove useful but again I am fairly strapped for time.

I would be happy to talk with you by phone about any of these men or about ways of developing further information on them for your purposes.

Sincerely,

Emory F. Via
Director
Labor Program

April 1, 1966

TO: Dr. Curtis C. Aller, Director
Office of Manpower Policy, Evaluation and Research
U. S. Department of Labor
Washington, D. C. 20210

FROM: Dr. Sam F. Parigi, Project Director

SUBJECT: Progress Report No. 6, Southern Rural Training Project: National Sharecroppers Fund -- OMPER Demonstration Project No. 83-31-07 in Developing Job Training Programs among the Hard Core Unemployed and Underemployed in Southern Rural Areas.

Report for February, March, 1966

New project development and service to expedite the funding of proposals already submitted characterized SRTP's operations during the past two months. However, equally significant has been the funding of two additional EOA Title III-B projects (200 trainees total) and the approval for funding in April of a project (180 trainees) by the U. S. Office of Education. Therefore, six SRTP projects have been funded in the past four-month period and we anticipate funding of three other programs by the end of May.

Four proposals have been submitted during the report period: two to the Office of Manpower Policy, Evaluation, and Research (U. S. Department of Labor), one to the Bureau of Apprenticeship and Training (Experimental and Demonstration program), and one to the Migrant Division (Office of Economic Opportunity). In addition, SRTP has participated in program construction on two other projects that have been submitted and considerable developmental work has already taken place

on six EOA Title III-B programs and four OMPER E & D projects. It is a continuing challenge for SRTP to develop and to service through funding all projects with which we are associated.

I. EOA TITLE III-B PROGRAMS FOR MIGRANT AND SEASONAL FARM WORKERS

1. Programs Funded

MACTAD (Mobile, Alabama). Sargent Shriver, Director of the Office of Economic Opportunity, announced on March 30, 1966, a grant of $52,131 to the Mobile Area Committee for Training and Development, Inc. The funds will finance an educational and prevocational training program for 100 low-income, seasonally employed agricultural workers. Prevocational training follows the cluster pattern and is designed to raise the skills of the trainees who remain in agricultural work, and also to provide introductory training for occupations outside agriculture. MACTAD, Inc., has also applied for an OMPER E & D, and it is anticipated that some of the EOA III-B graduates will have their educational and skill levels raised sufficiently so that they may be eligible to participate in the MDTA project when it is funded. (See also Summary and Evaluation.)

Ferriday, Louisiana. The announcement of this program's funding was made on March 28, 1966. Basic education, prevocational training and supportive services will be offered to 100 low-income seasonally employed farm workers from Concordia Parish in the upper Louisiana Delta area. This program's approval marks the second funding of

SRTP-developed EOA III-B's for seasonal farm workers in Louisiana, the only such programs approved to date in that State. (See also Summary and Evaluation.)

2. Proposal Submitted

Fayette County, Tennessee. Fayette County is ranked the third lowest county in the United States by annual family income ($1,363), and the fourth lowest in per capita income ($470). The need for manpower development projects is obvious, and SRTP, through the sponsorship of the Fayette County Economic Development Commission (Leander J. Palmer, Director) and with the cooperation of numerous county officials, quickly developed this program which will offer basic education, prevocational training, and supportive services for a three-month period to 180 unemployed or seasonally employed persons. Among the criteria for entry into this program are: an annual family income of less than $1,000 a year and an educational level of less than sixth grade.

Prevocational training will be given in three clusters: (1) Agriculture, including instruction in small farm management, new and improved farming techniques, crop rotation, fertilizer preparation and application, machinery operation and minor repair; (2) building trades, such as carpentry, electrical work, brick masonry, and plumbing; and (3) homemaking education, with instruction on child guidance, home care of the sick, family hygiene, home management, sewing and clothing care.

This program should be especially meaningful because of the participation of volunteer professionals. As an example, Art Emory of the National Sharecroppers Fund will offer the trainees suggestions on credit unions and cooperatives. J. M. Nunnerly of the Farmers Home Administration will explain the availability of $1,000 signature loans to owners of homes and will assist persons who so desire to apply for the loans.

The development of this project is reflective of our recent SRTP efforts in the field of EOA III-B's. An area was chosen because of its low income level and lack of MDTA and OEO projects. Most persons, initially contacted, stated that the area did not have an off-farm season in the summer. Albert Newall, SRTP Tennessee Field Representative, consulted with a number of helpful persons in the State Agriculture Department, but evidence seemed to show a period too brief for a project. Further contact with local agricultural experts revealed that recent changes in the county's agricultural situation now easily allowed a three-month program in the summer (lay-by period). Local farm authorities estimated that there was now a 75 percent surplus of farm labor due to cotton acreage cuts and farm mechanization. Walton Sharp, SRTP's Louisiana Representative who developed the III-B's in that State, then was assigned to the project. He and Newall received an enthusiastic response to the prospects of a III-B program from the local CAP, farm workers, educators and various agency personnel. With the two Field Representatives operating in "high gear" and the Knoxville office giving

priority to the proposal, a program was rapidly structured. A broadly representative Advisory Committee (including one-third representation of farm workers) was selected by the local group. At an early stage in project development, the Migrant Division of OEO was notified of our activity in Fayette County and Mr. Ken Vallis of that organization responded quickly by visiting in Somerville on March 22 to discuss the project with its sponsor. On the night of March 22, two weeks after Newall's initial inquiry, the EOA III-B Advisory Committee met and, after a thorough explanation and discussion of the proposed project by Mr. Vallis, Dr. Sam F. Parigi (SRTP Director), Mr. Sharp, Mr. Newall, and Mr. Palmer, the necessary OEO forms were signed. The proposal had been developed with haste, but not waste. The sponsor helped SRTP representatives "touch base" with local workers, educators, and governmental officials and SRTP also informed related state agencies of the program (Example: State OEO, State Department of Employment Security, which normally has a representative in Somerville one day a week, and State Vocational Education). The Fayette County project bids to be the first EOA Title III-B in Tennessee.

3. Projects In Advanced State Of Development

Dorchester, South Carolina. This project is to be sponsored by the Colleton-Dorchester Counties Development Corporation, the CAP agency for Colleton and Dorchester Counties. L. S. James, SRTP's South Carolina Field Representative, and Walton Sharp are developing the program which is designed to serve 120 low-income, adult, seasonally

employed farm workers. Income statistics show that 49.6 percent of the family units in Dorchester County have annual incomes of less than $3,000. The program, as presently envisioned, will be a year-round one, with full-time education and prevocational classes during the off-farm season and education classes two nights a week during the farm season. Farm workers, educators, and representatives of related agencies have offered their cooperation and Ken Vallis of the Migrant Division met with the program's sponsor on March 17. Drafting work has begun on the proposal which will be submitted in April.

Tennessee Elk River Development Association (TERDA). On March 23, 1966, Albert Newall and Dr. Parigi of SRTP met with Mr. Cuyler Dunbar, Director of the COMET E & D; Mr. Ralph Mitchell, Executive Director, Elk River Development Association; Mr. Mark Whitaker, Director of TERDA; Mr. James Lemons, TERDA Program Analyst; Mr. Robert Marshall, COMET Elk River Director; and Mr. B. H. Cummings, a COMET OJT Supervisor, to discuss a successor program to the COMET Project which will soon terminate in the area. Various alternatives were explored in a full-day meeting and it was finally resolved that attention should focus on developing a rather distinctive EOA Title III-B for 320 "rockbottom" rural farm workers. A subsequent meeting to discuss the project has been scheduled for Knoxville in early April. TERDA is the CAP agency for a nine-county area of South-central Tennessee and will sponsor the program.

The genesis of SRTP's involvement in this project is interesting. Cuyler Dunbar had originally suggested that the Elk River group contact SRTP for assistance in project development. Thereupon, Mr. Ralph Mitchell met with Mr. Peter Pesoli, SRTP Field Coordinator, in Knoxville to discuss the Elk River's competency to sponsor and their desire for a manpower project. Subsequently a delegation from Elk River went to Washington to contact Congressmen and federal agency personnel about possible programs in their area. On this occasion, two Washington officials recommended to the Elk River delegation that they seek assistance from SRTP for their program development.

Thibodaux, Louisiana. Because of his developmental work in Louisiana, SRTP's Walton Sharp was invited to attend the quarterly Louisiana State OEO Conference in Baton Rouge. At this meeting Sharp was introduced and mention made of his development of the Reserve, Louisiana, EOA III-B. Subsequently a number of persons contacted him at the conference, including Lucien Caillouet, Director, LaFourche Parish CAP, who asked assistance in developing a III-B program. The project's development began shortly afterward, including the formation of an Advisory Committee on March 3, 1966, and a visit from Ken Vallis of the Migrant and Seasonal Farm Workers Division on March 23, 1966. It is projected that the program will reach 180 low-income, undereducated farm workers.

The genesis of SRTP's involvement in this project is interesting. Cuyler Dunbar had originally suggested that the Elk River group contact SRTP for assistance in project development. Thereupon, Mr. Ralph Mitchell met with Mr. Peter Pesoli, SRTP Field Coordinator, in Knoxville to discuss the Elk River's competency to sponsor and their desire for a manpower project. Subsequently a delegation from Elk River went to Washington to contact Congressmen and federal agency personnel about possible programs in their area. On this occasion, two Washington officials recommended to the Elk River delegation that they seek assistance from SRTP for their program development.

Thibodaux, Louisiana. Because of his developmental work in Louisiana, SRTP's Walton Sharp was invited to attend the quarterly Louisiana State OEO Conference in Baton Rouge. At this meeting Sharp was introduced and mention made of his development of the Reserve, Louisiana, EOA III-B. Subsequently a number of persons contacted him at the conference, including Lucien Caillouet, Director, LaFourche Parish CAP, who asked assistance in developing a III-B program. The project's development began shortly afterward, including the formation of an Advisory Committee on March 3, 1966, and a visit from Ken Vallis of the Migrant and Seasonal Farm Workers Division on March 23, 1966. It is projected that the program will reach 180 low-income, undereducated farm workers.

Thomasville, Georgia. Early SRTP explorations in Georgia revealed a need for manpower programs in the Southwestern area of that State. Alfred Morris, SRTP Field Representative, is developing this project which will have as its sponsor the Southwest Georgia Community Action Council, Inc., a CAP group representing thirteen counties. There is some question at present on the number of counties which will be served by the project, and consequently the number of trainees. Indications are that this EOA III-B will serve approximately 200 trainees, 100 in each session. To date, there are no funded EOA III-B's in Georgia.

4. Other EOA III-B Projects Being Developed

Alexandria, Louisiana. A CAP agency, which was to sponsor the project, has had some internal difficulties, so SRTP has arrested its program development until the dispute is resolved. It now appears that the different groups are reaching a compromise and perhaps a needed program can be developed soon to utilize the services of many capable volunteers who wish to help less fortunate persons in their area.

Elloree, South Carolina. Considerable "leg-work" has been done on this tentative project which will project SRTP into the self-help housing field. Complex problems concerning construction, legal titles, and work-sharing agreements will necessitate a delay in further project development until May. SRTP's staff is small and a

decision had to be made to delay this time-consuming project so that other equally desirable projects could be submitted in April and early may.

Shiloh (Tennessee). A multi-county CAP agency (with several EDA counties included) has indicated a desire to sponsor an EOA III-B for approximately 400-800 persons. Extensive contacts with farm workers, county officials, and school representatives reflect keen interest in the program, especially in view of the fact that the sponsor was becoming disappointed because of the previous rejection of several proposals which it had submitted.

Dillon, South Carolina. Initial contacts have shown widespread interest in a year-round program for this rural area of South Carolina. Many of the farm workers contacted by SRTP Field Representative L. S. James confided that they had never been to school and they cannot read nor write. Sponsor: Dillon County Community Action Council, Inc.

State Of Florida EOA III-B. Alfred Morris has acted as a consultant to the State Office of Economic Opportunity in its development of a program to serve 2,500 trainees in nine counties of Florida. The proposal should be completed by the end of March and will be submitted to Tom Karter, Chief, Migrant Division, OEO in Washington. This program again demonstrates the cooperative relationship that SRTP has developed with state agencies.

5. Previously funded Projects

Reserve, Louisiana. One hundred and twenty trainees are actively participating in this project. Of the 133 persons receiving physical examinations, tuberculine time tests showed 42 positive, and follow-up examinations revealed that a few of these required medical attention. One unanticipated problem developed when the sponsor had difficulty in obtaining bonding because the project was only scheduled for a three-month period. SRTP's Field Representative learned of the problem and was able to arrange the bonding service.

II. COOPERATIVE RESEARCH DIVISION, OFFICE OF EDUCATION, H.E.W.

Approved For Funding

Project TEST. Project TEST has been approved for funding having cleared all review barriers. As related in Progress Report No. 5, the funding of the program was progressing much more slowly than anticipated. On March 1, we learned that the program had been transferred from the Division of Adult and Vocational Research to the Division of Elementary and Secondary Research. Subsequently it appeared, because of complications created by its having been transferred to another division, that the program would not be funded in the current fiscal year. (Our experience is that programs which linger from year to year tend not to be funded.) Mr. Peter Pesoli, SRTP Field Coordinator, then made a special trip to Washington on March 10 to expedite the

program which is designed to upgrade the skills of 180 teachers in Florida who, despite having failed to achieve the minimum 500 score on the National Teachers Examination as required by Florida law, still have the potential and desire to remain in teaching. After conferences with Mr. Walter Mylecraine, Assistant to the Deputy Commissioner of Education, Dr. Lewis Bright, Associate Commissioner of Education and Director of Cooperative Research Division, and J. Ned Bryan, Officer in Charge of Curriculum Branch, in which Pesoli explained the urgency of the program and the funding technicalities which had been encountered, the SRTP Field Coordinator was told that the program was an excellent one and that it would be funded by the U. S. Office of Education. That same day the program's sponsor, the Florida State Department of Education, was notified by Mr. Mylecraine that the program had been approved. Upon the request of Dr. Joseph W. Crenshaw, Director of Instructional Services, Florida Department of Education, Pesoli went to Tallahassee, Florida, to assist in making modifications to the program schedule so that classes may begin on May 16.

Since the program's sponsor and SRTP have been informed that the project is ready for the formal signing, funding may reasonably be expected to occur in early April.

III. MANPOWER DEVELOPMENT AND TRAINING ACT EXPERIMENTAL AND DEMONSTRATION PROJECTS

1. Proposals Submitted In Reporting Period

Training Indigenous Persons For Sub-Professional Occupations (Jackson State College, Jackson, Mississippi). SRTP was requested by OMPER to contact Dr. Jane E. McAllister, Jackson State College, and assist in the development of an E & D program. Dr. Parigi met with Dr. McAllister and other interested staff members of the college on February 10. At this conference an earlier proposal draft by the college was discussed as were methods for expanding the program. After a full interchange of information and ideas, SRTP was given permission to draft a proposal for submission to OMPER. O. H. Simmons of the Mississippi Employment Security Commission was informed of the project and he, in turn, gave needed information to estimate training allowances. The proposal was quickly developed and hand-carried to Washington by the Project Director on February 24. A conference was held that day with OMPER officials: Mr. Seymour Brandwein, Director, Office of Special Manpower Programs, Mr. Charles Gilmore, Chief, Special Programs, Dr. Arenia Mallory, and Mr. Richard McAllister. At this conference tentative approval was given to the proposal and SRTP subsequently presented the final proposal to OMPER on February 24. The project will train 115 underpriviledged persons as "counseling interns" to fill the demand of governmental and private employers for social service personnel.

Since the proposal was submitted to OMPER, SRTP has discussed the proposal with State Employment Service and Vocational Education, and also Regional Employment Service and H.E.W. representatives. A target date for funding of May 1 has been set.

Mobile Area Committee For Training And Development (MACTAD, Mobile, Alabama-OMPER. Expectations for the funding of this program soared as a result of a conference at OMPER offices in Washington on February 24 between Mr. Gilmore, Dr. Mallory, Dr. Robert Gilliard (MACTAD), Father A. S. Foley (MACTAD), Mr. Jim Hendricks (MACTAD), Mr. Jim Blackburn (Employment Service), Mr. Pesoli, and Dr. Parigi. The checkered life of this project has been recited in earlier reports, but a positive turn occurred at the meeting when OMPER agreed to consider funding the entire "package" of remedial education, institutional training, and supportive services for 280 trainees. A target date for funding of May 1 was set at the conference. Because of the time that had transpired and the changed conditions, it was necessary to completely redraft the proposal. Before doing so, however, Newall and Parigi of SRTP met in Montgomery with Mr. Copeland J. Pace, Coordinator of Manpower Training, Alabama State Employment Service and Mr. C. S. Bilbro, Assistant MDTA Director, Alabama Vocational Education Department, on March 3 in order to coordinate the project revision with their agencies. On March 10 SRTP's Director met in Mobile to review the proposal revision with the

sponsor, and the new proposal was submitted to OMPER by mail on March 16. Since that time SRTP has had introductory discussions on the project with Regional ES and H.E.W. personnel.

Bureau Of Apprenticeship and Training - MACTAD E & D. To complement and expand the MACTAD-OMPER E & D, a separate BAT-MACTAD E & D has been developed and submitted by SRTP. After a series of duscussions with various agency personnel at national, regional, and state level, SRTP concluded that the OJT component could be processed more easily if it were submitted as separate, but tied to the OMPER E & D. The design of this proposal is to seek funding of 100 OJT slots by BAT, but to have the entire administrative cost of the OJT development included in the OMPER-MACTAD E & D. The funding of the BAT-MACTAD E & D is, therefore, contingent upon the funding of the OMPER contract and the two contracts are scheduled to conclude on the same date.

Comment On Project Development And Servicing. These two MACTAD E & D projects have required a significant amount of SRTP staff time, but without that involvement the proposals would not be progressing. A rough summary of SRTP-MACTAD E & D activities during the past two months will perhaps illustrate what SRTP means by the term "servicing a project." Conferences have been attended specifically to discuss MACTAD E & D projects in Washington, Atlanta, Montgomery, and Mobile. Sixteen telephone conversations were initiated by SRTP on behalf of these projects, and at least eight telephone calls were received. In addition, fourteen

letters were written to expedite the project. It is now hoped that the project is "on the way" and that correspondingly less SRTP time be required.

2. Projects In Advanced Stage Of Development.

Mississippi Forestry Project. This project marks another example of SRTP's "outreach service" to OMPER. On March 1, Mr. Gilmore of OMPER requested SRTP to undertake the development of a Mississippi E & D project which had the interest of the State Employment Service and the U. S. Forest Service. Consequently Albert Newall and Dr. Parigi met with Dr. Henry Taylor, Rural Community Development Service (U.S.D.A., Washington); Mr. C. M. Evenson, Regional Job Corps Coordinator; Mr. Dale Eaves, BES (Atlanta Region); Mr. Harvey Jackson and Mr. Fred Ungerer of the Mississippi Employment Security Commission; and Mr. Tom Forister, National Forests in Mississippi, on March 4 in Jackson, Mississippi. This meeting was an exploratory one, but in a second meeting, which was held in Jackson on March 14, a number of decisions concerning the structuring on the project were made, and agreement was reached on sending information to Knoxville so that a draft proposal could be written. Among the participants at this meeting were Mr. O. H. Simmons, Mississippi E.S.; Mr. A. P. Fatherree, Mississippi Director of Vocational Education; Mr. H. T. Huddleston, President of Summit Junior College; and Mr. Del W. Thorsen, Deputy Forest Supervisor, National Forests in Mississippi; and SRTP representatives. Upon the receipt of information from

conference participants, SRTP drafted a proposal which was mailed to the concerned agencies on March 4. The proposal will be reviewed by these agencies and then a final draft will be submitted to OMPER. This is the first time that SRTP has participated with RCDS in project development, but it appears that such an association may be mutually beneficial.

Orleans Parish Prison. Program development has continued on this project and proposal drafting has begun. Some problems are being encountered on reaching agreement as to proper structuring of the program so that it will have the needed flexibility essential for a social and training center for released prisoners. One distinctive feature of the planned program is the extensive use of highly qualified professional volunteers. Representatives of the Louisiana Employment Service and Vocational Education Department have been kept abreast of developments.

3. Proposal Previously Submitted

Ability Development For Demand (ADD), Tampa, Florida. It has been decided that the University of South Florida will act as program sponsor rather than Tampa's Office of the Mayor. Reportedly, this decision was reached at a Washington conference of March 8, 1966. OMPER did not notify SRTP of the sponsor change, and our effectiveness in servicing the project has been impaired. Nevertheless, we are continuing our efforts in the program's behalf and it is our understanding that the MT-1's will soon be completed.

4. Other New Developments

Triana (Triana, Alabama). A meeting was held at the Pulaski-Cavalry Hill Rehabilitation Center on February 10, between SRTP's Peter Pesoli and Albert Newall, Charles T. Brandon, Chairman, Pulaski-Cavalry Hill Recreation Committee, Leon Frazier, President of Technical Assistance Committee, and Clyde Foster, Mayor of Triana. The purpose of this meeting was to explore ideas for making Triana a component part of the present Pulaski-Cavalry Hill E & D, which would strengthen the program of both groups. Additional information has been gathered which will speed the proposal development and Mr. Pesoli contacted the Huntsville E.S. Office to notify them of the contemplated activity.

Training School For Boys (Milledgeville, Georgia). The proposed sponsor for the project has had to decline further active participation because of recent changes at the institution. However, the contact person has agreed to cooperate if another sponsor wishes to conduct the program and it appears that a Georgia university will seek the project. If so, the program to provide training for child care workers will be altered to reflect the ideas of the new sponsor.

Test II Project (State of Florida). SRTP has delayed development of TEST II because of the frustrating problems of implementing TEST I. TEST II, which seeks to upgrade the skills of displaced teachers in related but non-academic fields, is designed as a companion proposal to TEST I and program development will now be renewed.

5. Previously Funded Projects

Austin Peay State College Project (COMET). COMET continues to function in a highly creditable manner, and good communications exist between Mr. Cuyler Dunbar, COMET Director, and the SRTP staff. Upon the request of Mr. Dunbar, Newall and Morris of the SRTP staff undertook OJT development for COMET on three days during the bitter cold wave of early February. Mr. Dunbar has also introduced SRTP staff to persons in the Elk River and Beech River areas of Tennessee who are seeking manpower programs to continue the work begun by COMET.

Loyola University Project (SEESAW), New Orleans, Louisiana. Active recruiting of trainees for the secretarial phase of the project to be held in Reserve, Louisiana, commenced in the latter part of February and the formal training began on March 21. Some difficulties are being encountered in finding adequate training facilities in Slidell, but the sponsor is optimistic that the program will start there, as planned, on May 1.

St. Mary's Dominican College Project (New Orleans, Louisiana). Classes for secretarial training and dialectic speech remediation began in early January. Mrs. Geoffray, Project Director, has related that trainees were keeping pace with the course outline, and that the majority, through individual efforts outside class, were ahead of schedule. The presence of counselors at the training site is credited with diminishing trainee problems. SRTP's Field Representative spoke to several trainees who were grateful for the opportunity of getting the training and enthusiastic concerning the program.

IV. ECONOMIC OPPORTUNITY ACT (Other than Title III-B)

1. Section 206 and Section 207

National Sharecroppers Fund Proposal. SRTP's parent has originated the idea of a project which would not only provide technical assistance in project development, but also train rural persons to: (1) acquire sufficient technical knowledge to assess their community and individual needs, (2) develop programs (under EOA, Vocational Education Act of 1963, Elementary and Secondary Education Act, Manpower Development and Training Act, etc.) to meet those needs, and (3) carry out such programs successfully. SRTP assisted in drafting the proposal which was submitted to OEO in March. NSF has arranged a meeting with Sargent Shriver on April 6 to discuss the proposal and rural conditions. Several key board members of NSF, Miss Fay Bennett, Executive Secretary of NSF, Pesoli and Parigi are scheduled to attend the meeting.

2. Title II-B

Holly Hill, South Carolina. Our last Progress Report showed 375 trainees receiving adult education training, but the program has now expanded to 500 enrolees. State officials have told our South Carolina Representative that the program is especially successful because of the active support of local organizations.

V. OJT DEVELOPMENT

SRTP's OJT work has primarily occurred in Georgia, South Carolina, and recently in Tennessee. Our system of referring signed OJT-1's from area redevelopment areas to local BAT representatives met with varied results. In some instances the employer has been quickly contacted and the application processed. In other instances, several months have elapsed and BAT representatives have not established contact with OJT-1 signers. As a result of BAT-SRTP combined efforts, training slots have been approved for 62 persons under OJT provisions. SRTP's next Progress Report will contain a more comprehensive treatment of OJT activity.

See also BAT-MACTAD E & D under Section III.

VI. OTHER ACTIVITIES

1. Florida Migrant Center

Mr. Julian Morse, Coordinator of Migrant Education, Florida State Department of Education, invited SRTP's Field Coordinator to a meeting attended by a number of persons working with migrants on February 17 in Florida in order to discuss the possibility of establishing a center to train sub-professionals (and some professionals) working with migrants. As a consequence of this meeting, and subsequent discussions, it was decided to change the proposal site of this training from Florida Atlantic University to the University of South Florida.

SRTP has been asked by Mr. Morse to assist in the development of this program and a tentative meeting date has been set with officials of the University of South Florida. Some work has already been done by SRTP on a component of this program with Mrs. Minnie Fields of the Florida Migrant Education Office.

2. An article by the Project Director entitled, "The Tennessee Pilot Farm Management Projects" was published in the January, 1966, issue of the Employment Service Review.

3. Walton Sharp was instrumental in bringing together 20-40 students of the Louisiana State University Catholic Center with Mr. John Goodman, Director of the Medicare Alert Program. The students were thus able to render help where it was needed and, at the same time, became introduced to "Poverty Programs" in which they have an interest.

VII. SUMMARY AND EVALUATION

SRTP is extending itself to develop projects in all corners of the Southeast. During this reporting period projects have been funded in Louisiana and Alabama. One proposal has been approved for funding in Florida and additional workers were placed on OJT's in Georgia. One proposal has been submitted from Mississippi and another from that State is being reviewed by cooperating agencies before formal submission. In Tennessee, one project was submitted and projects in South Carolina and Georgia are in advanced stages of preparation.

The acceptance of our project by agency personnel seems to improve each month, and oftentimes SRTP has been asked or is recommended to participate in development of new programs. "Success breeds success" is an old adage, and with each additional funding, new requests are being made to SRTP by local sponsors for assistance in project development. Unfortunately our small staff of six is limited in the number of projects it can handle at one time. It is the staff's feeling that this healthy response to SRTP's activities is reflective of the need to more directly carry manpower projects to rural areas and to provide the "total service-package" indicated in this report.

The sponsors, SRTP (and marginal farm workers) were gratified by the funding of the two EOA III-B projects. However, the projects were funded later than expected which has resulted in considerable pressure being placed on the sponsor by applicants and potential staff interested in participating. The funding delays have also created problems of recruitment since few instructors can long afford unemployment and some trainees, who are temporarily employed during a short farm season, will miss the program which they heartily sought during the off-farm season. These funding delays were not encountered on the previously funded Reserve III-B which was submitted to the Migrant Division on December 3, 1965, and approved by OEO on January 24, 1966. Apparently a joint announcement is now needed from both OEO and the U. S. Department of Labor, and the ramifications of that joint announcement appear to have delayed the fundings of these latter projects.

SRTP's contract is due to expire on July 9. Given the fast pace of present project development, the new opportunities opening to us, and our desire to provide the maximum service possible, we are faced with the problem of maintaining the momentum of the Project, while at the same time providing for an orderly termination of our operation. The problem is compounded by the fact that SRTP does not wish to leave a number of potential sponsors dangling with half-completed developmental work.

NOTE: SRTP was given permission by Mr. Charles Gilmore to submit this report late because of the priority of project development in which it was engaged during the usual time allocated for drafting the Progress Report.

Mr. Emory Via
Southern Regional Council
5 Forsyth Street, N.W.
Atlanta, Georgia 30303

Dear Mr. Via:

I have talked with Dr. Ray Marshall today concerning our need for professional staff to continue our Southern Rural Training Project in the event our Labor Department's contract will be renewed and also to direct an OEO project in the South which may develop before long. Dr. Marshall said that he believed your work with SRC might be terminating and that you might be interested in working with one of these projects.

Enclosed is a folder describing the SRTP as well as its last Progress Report. I am sure you will find the report most exciting as it mentions a wide variety of training programs which have been developed recently for the rural poor in a number of Southern states. If our contract will be renewed, we will probably retain the present field staff, but we will be seeking a new project director and a new field coordinator since the present ones are committed to return to their colleges at the expiration of our present contract.

Our proposed OEO program would be of a somewhat similar nature and would involve working with rural community action groups and helping them to develop proposals under all available legislation.

If you are interested in either of these programs, I should appreciate hearing from you as soon as possible and hope that you will send me a resume.

Sincerely yours,

Fay Bennett

To: Mr. Emory Via

From: Fay Bennett

I hope you will review before the White House Conference the enclosed memo on Policy and Program to End Poverty in Rural America as well as our enclosed Board report on "The Condition of Farm Workers and Small Farmers in 1965."

They point to the deepening crisis in rural America and suggest massive programs to prevent social breakdown in rural areas and the compounding of present intolerable conditions in urban ghettos.

5 Forsyth Street, N.W.
Atlanta, Georgia 30303

Dear Mr. Via:

It now appears that the Office of Economic Opportunity may approve and fund a project under our direction to work intensively in Alabama and Georgia with the rural poor. If this happens, we will be looking for the best qualified people we can find to direct this project.

Enclosed is a summary of the project, as well as job descriptions for the two top positions. If you are interested in either of these positions, I would appreciate hearing from you at the earliest possible moment. If you are not interested or available, I would appreciate any suggestions you can make of good people who might be interested and qualified to direct this important project. It may be that it might begin operations early in the new year.

Sincerely,

Fay Bennett

P.S. Enclosed is a reprint from the Employment Service Review showing that training programs and the coordinated assistance of all relevant federal agencies can make it possible for marginal farmers to increase their incomes greatly, and make a go of a small farming operation. Also enclosed is an article which appeared in the New York Times recently, quoting figures put together by the National Sharecroppers Fund on the exodus of poor Negro and white farmers from the South. My final enclosure is the first issue of Rural Advance which I am sure will interest you.

SUMMARY

Proposal of the National Sharecroppers Fund, Inc. to the U.S. Office of Economic Opportunity for "Training and Technical Assistance in Diversified Program Development for the Rural Areas of Alabama and Georgia":

The demonstration project is designed to bring to the impoverished areas of Alabama and Georgia a wide range of anti-poverty programs, with particular emphasis on but not limited to, those job-training and educational programs and services potentially available under non-OEO legislation. The project will provide necessary professional and sub-professional assistance to rural poor to enable them to initiate, organize, design, acquire funding for, and implement government programs that presently are not available to the poorest rural citizens of Alabama and Georgia. The project will also assist in improving the existing services of local and other public agencies.

In addition to diversified program development, the project will provide "on-the-job" training in community organization and in program development to a minimum of 40 indigenous field interns. This training will be accomplished through the employment (via stipends) of local rural residents who will each be assigned to work with a Field Representative for a three-month period, assisting the Field Representative in his work and thereby learning the techniques of that work.

The project's proposed effective and extensive use of funds from governmental sources other than OEO is an attempt to "pump prime;" in other words, to employ a minimum amount of the severely restricted money allocated to the Office of Economic Opportunity in order to help release potential anti-poverty funds from other sources and from other federal and private agencies.

A major benefit of the project should be the fund of empirical information gained in the year's operation: "model programs" and guidelines for crop diversification, low-cost housing, job-training for low-income rural people, multi-service community action and community service, all of which prove to be effective in ameliorating the conditions of poverty in rural communities.

There will be a Southern-based policy advisory board to the project, which will meet regularly to offer suggestions for the program development activities of the project staff. This board will include not only members of the distinguished national board of NSF but also a representation of community-interested poor persons in the rural South. As the project sponsor, the National Sharecroppers Fund will have overall supervision of the project.

There will be intensive training sessions and institutes for both the project staff and the indigenous field trainees which will begin with two full weeks and will be supplemented by periodic weekend and one-day in-service training sessions, using consultants from the NSF board, from other program development projects, and from government agencies.

The Project has a budget of $230,000 for one year; and will employ the following staff: 1 Project Director, 1 Field Coordinator, 1 Resource Director, 6 Field Representatives (specialists in community organization and program development), and necessary secretarial and clerical staff. The project's main office will be in Atlanta, Georgia.

JOB DESCRIPTIONS

Project Director. (Salary Range: $12,000 to 14,000)

Under the supervision of the National Sharecroppers Fund's Executive Secretary, the Project Director will be responsible for the overall organization, scope, pace, and functioning of the project, and will provide overall supervision to the field staff. He will be responsible for the actual execution of the program in the field. He will be based in Atlanta.

Field Coordinator. (Salary Range: $9,000 to 11,000)

Under the direction of the Project Director, the Field Coordinator will assist the Field Representatives in planning and carrying forward the field program, including negotiations with state and local officials, with local CAP groups, and with other community organizations; he will also aid the Project Director in such other ways as are deemed desirable to ensure constant supervision of the field staff.

The New York Times.

NOVEMBER 27, 1966.

NEGROES LEAVING FARMS IN SOUTH

Their Rate Is Twice That of Whites Who Leave

Special to The New York Times

ATLANTA, Nov. 26—Farming is gradually becoming an all-white occupation in the South.

Only 142,506 Negroes were among the 718,900 farmers left in eight Southern states at the end of 1964.

The number of farmers of both races is shrinking, but the shrinkage among Negroes is more than twice as great.

These facts are contained in figures gleaned by the Atlanta office of the National Sharecroppers Fund. The fund extracted the figures from a five-year agricultural census completed recently by the Federal Census Bureau. The figures show the number of farmers, white and nonwhite, in the eight states in 1959 and in 1964.

The states are Alabama, Arkansas, Florida, Louisiana, Mississippi, North Carolina, Tennessee and South Carolina.

The census showed that the total number of farmers in these states declined from 890,283 in 1959 to 718,900 in 1964.

Whites Decline 15 Per Cent

The eight states had 679,692 white farmers in 1959 and 576,394 in 1964. This was a drop of 103,298, or 15 per cent, in the ensuing five years.

Negroes on the farm declined from 210,591 to 142,506, or 32.4 per cent, during the same period.

Most of those who left the farm were tenants—either sharecroppers, who share the harvest with the owner, or those who pay cash rent.

Forty-two per cent of all Negro tenants in the eight states left the farms during the five years. The number dropped fro 119,620 to 69,426.

White tenants abandoned the land almost as readily. The number dropped from 118,468 to 79,119, a decrease of 33 per cent.

Of those remaining on the farm in 1964, a total of 570,315 owned their own land, in full or in part. And of these, 497,275 were white. Thus, 86 per cent of the whites still on the farm own their own land, fully or in part, and only 14 per cent were renters.

Negro Renters

By contrast, almost half of the Negroes remaining were renters — the group with the least hold on the land and the greatest willingness to leave it.

Of the Negroes remaining, 69,426 were tenants, 50,085 were full owners and 22,955 were part owners.

Only four of the eight states still had comparatively large numbers of Negro farmers by 1964. Alabama had 20,941, down from 29,234 in 1959. Mississippi had 37,701, down from 55,369. North Carolina had 29,909, down from 43,973. South Carolina had 19,602, down from 30,977.

Arkansas still had 71,003 white farmers, down from 79,000, but only 8,589 Negroes, down from 14,657. Negro tenant farmers in Arkansas declined 53.5 per cent, from 8,100 to 3,766.

Mississippi had the largest number of Negro tenant farmers in 1959—32,854. It lost 43.4 per cent of them, down to 18,580, but still had more than any other state covered by the census.

The Tennessee Pilot Farm Management Projects

SAM F. PARIGI

What appropriate skill training programs can be developed for unskilled, undereducated, low-income farmers living in economically declining rural areas? This problem for developers of manpower programs is compounded by the outmigration of younger, more skilled persons from such rural areas, and the difficulty of placing older, farm-oriented trainees in urban jobs. Tennessee's pilot farm management program is giving evidence of being a successful answer to this training challenge.

The MDTA farm management pilot program was developed through the cooperation of the Tennessee Vocational Education Division, the Tennessee Employment Service, and agencies of the U.S. Department of Agriculture. Although the program is still considered in the pilot stage, seven projects have been completed and four are in progress.

The Training Program

In conjunction with the county school boards which act as sponsors for these programs, the Tennessee Division of Vocational Education has developed a program designed to raise the income of trainees by 20 to 40 percent in the first year and 60 percent over a 3-year period. Prime attention is directed to four topics: Soils, crop production, livestock production, and farm plans. Other subjects receiving considerable attention are income taxes, electricity, farm organizations, and farm legislation. In each case, the trainee is shown how the topics in the training program apply to his own farming operations. This is the key to the high interest and success of trainees in the pilot projects.

A typical program would begin in July with the farm management instructor visiting the farm of each trainee to assess its potential and to discuss with the trainee what definite projects are to be undertaken on the farm as part of the training program. An overall farm plan is then developed for each trainee. The soil on each farm is "typed" early in the program by the Soil Conservation Service and the trainee is shown how to utilize the new information in his planting and fertilizing practices. Use is also made of "averaging" sheets, by which the farmer can compare his net income against what a similar farm would produce with fairly good management practices. Since trainees rarely net as much income as the farm sheets project, this income disparity provides incentive to learn and to exercise proper farm management practices.

Small farmers normally have inadequate records, so each trainee is taught to keep a record book of his farming operations. Bookkeeping is introduced early in the program, and the farm management instructor continues to check the farming records once a month.

Because most trainees know little of the range of agricultural services available to them from the U.S. Department of Agriculture, provision is made for representatives to explain their functions. In addition, the State Agricultural Stabilization and Conservation Service (ASCS) has made extra funds available to the trainees to carry out the soil conservation measures determined upon in their individual overall farm plans—

Dr. Sam F. Parigi is Director of the Southern Rural Training Project while on leave from Lamar State College.

For this farmer, the training resulted in better sanitation and good pastures for his livestock.

The trainees were shown how to reclaim their rain washed land so it could become productive.

liming, seeding, erosion control, and woodland improvement. Since funds from the ASCS must be matched by the farmer from his own resources, the trainee is urged to utilize at least part of his training allowances for this purpose. Field trips to experimental farms and plots of successful farmers are also taken to demonstrate proper farming techniques.

Vastly different educational levels are found among the trainees, although the program originally sought to require achievement equivalent to that of a high school sophomore for participation. In the first pilot program, provision was not made for specific classes in basic education, but 100 hours of communications instruction are now provided.

An interesting facet of the program is the integration of farm training and mathematical education. For example, the techniques of measuring land are first treated in the classroom, and instruction is given at that time on the multiplication and division needed to complete the task. Then the class goes into the field to apply the principles learned.

Throughout the program, classroom principles are directly applied to each farm. The instructor makes periodic visits to each trainee's farm and remains available to help the trainee if any difficult farming problems arise.

For trainees with marginal farms, the program may provide information on supplementary income opportunities. In one instance, the instructor suggested that the trainee might build a slaughterhouse to augment the farm income. The trainee bought a secondhand walk-in cooler and constructed the slaughterhouse with the aid of a $2,500 loan from the Farmers Home Administration. It is expected that the combined income from the farm and slaughterhouse operations will lift this trainee from the poverty classification.

Evaluation

The pilot farm management programs have shown outstanding success in raising the income of marginal farmers. A good example is the Yorkville Farm Management class,

the first of the pilot programs, which began on July 15, 1963. Income tax returns indicated average net farm income of $343 for 1962, but $1,285 in 1964. Nineteen men completed the course. One man sold his farm but the other 18 increased their income—14 by over 100 percent! It is expected that the income of the trainees will continue to increase as they complete the various stages of their overall farm plans.

Good Attendance

Attendance averaged 97.4 percent and five men did not miss a class during the entire year. An esprit de corps developed among the trainees, and the community leaders voiced their approval of the program. The success of the program may also be judged by individual conferences held with trainees by representatives of the Employment Service. When asked if they would now take a job in town, each program graduate answered, "No."

Several conclusions may be drawn from the experience of this pilot program:

1. MDTA training can substantially increase the marginal farmer's income, which is especially meaningful when viewed in the context of the limited economic alternatives for unskilled older farmers. Furthermore, the rapid increase in income may also serve to revitalize the economic condition of destitute rural areas.

2. Marginal farmers seldom have utilized the vast range of governmental aids for agriculture. MDTA programs can help remedy this situation by assisting the small farmer to obtain the agricultural services to which he is entitled. Moreover, the concentration of trainees makes it easier for the agricultural agencies to provide services. Rather than duplicating farm agency services, the MDTA program supports them.

3. MDTA courses should also be promoted for marginal small business owners who lack managerial "know how." There is an extremely high rate of small retail business mortality which could be lessened through training related to finances, marketing, recordkeeping, and inventory.

Sponsored by the National Sharecroppers Fund and financed by a Department of Labor contract (as an Experimental and Demonstration Project under MDTA), the Southern Rural Training Project has stimulated the development of 28 training and basic education programs for more than six thousand unemployed and underemployed persons in seven Southern states. A number of these programs have already been funded and are in operation.

The purpose of the Southern Rural Training Project, directed by Dr. Sam F. Parigi, was to demonstrate that local leadership in poor rural areas, in cooperation with local institutions and organizations, could develop training programs to up-grade the skills and economic status of low-income, poorly educated rural persons.

Because of the expressed great need for such training programs and the relative unavailability of government services in rural communities, the Southern Rural Training Project has acted as a bridge between federal programs and the people who need them.

CO-OP BILL TOPS PENDING LEGISLATION

Congressional activity in programs affecting rural poor is inspiring some cautious optimism that long-overdue legislation – ranging from co-op funding to child labor laws – may finally go on the books.

Among the most promising Washington developments is the new Title VII in the omnibus OEO bill being worked over by a joint House-Senate committee as RURAL ADVANCE went to press. Title VII will establish a Community Economic Development division specifically designed to help co-ops get started and stay alive.

This has been a major NSF legislative goal. Executive Director Jim Pierce and Washington legislative liason John Wilson testified in support of the unprecedented CED which could revive moribund federal efforts to encourage the cooperative movement. Presently, OEO assistance to co-ops like the Southern Agricultural Association of Virginia (SAAV) has been limited to certain initial administrative costs.

Broad Aid Offered

The pending bill would provide all or part of program costs to establish and operate a farmers co-op, and to develop processing, purchasing and marketing programs. The precise mix of loans and grants has not been spelled out, but provisions are included for individual aid to poor farmers trying to survive on the land. These loans, limited to $3,500, could be used for farm improvements, seed, equipment, and to assist farmers' participation in co-ops. Non-agricultural enterprises to supplement small farm incomes also would be eligible for federal support.

The pressing need for immediate federal action was spelled out by Jim Pierce in Senate testimony. *The New York Times* quoted his warning that displacement of small tobacco farmers by machines is about to duplicate the devastating effect of cotton mechani-

CANE WORKERS GET HEALTH CLINIC

A prescription of hope is being offered to the poor and sick of Louisiana's sugar cane country by the Southern Mutual Help Association (SMHA).

SMHA has opened a family health center in Franklin, St. Mary's Parish, where the average income of migrants and other farm workers is $2,600 a year and illness habitually goes untreated.

The center is an HEW-funded pilot project, the first of its kind in the state. Staffed by a full-time doctor and nurses, it will provide outpatient treatment along with outreach teams penetrating plantations where unnumbered sick are languishing. Rural people too proud to accept free treatment and too poor to pay standard $5 doctor's fees will be charged from 50¢ to $1.50 a visit. Cases requiring hospitalization will be referred to facilities in New Orleans.

Survey Preceded Grant

The HEW allocated $200,000 for the first year of a five-year program with additional funding on a year-to-year, apply-and-hope basis. Clinic approval followed an intensive medical survey of the area organized by Sister Anne Catherine, SMHA executive director and an RAF/NSF field representative. Among the findings was endemic malnutrition and worm infestation of children reaching an incredible 90 percent level during "barefoot" weather.

"We've rented a building once used by dentists but long abandoned," Sister Anne says. "So there were some minimal plumbing facilities and the like. However, we had to renovate extensively, set up a lab, and examining rooms. That left no money for needed X-ray equipment and other medical aids. We provide free drugs so funds have to be used sparingly to last out the year.

"Finding a doctor has been difficult, but we think we have one now. There is a nurse already on duty with special pediatric training enabling her to provide some services normally limited to a doctor. We want to set up health education and nutrition courses, to treat health problems in the broadest sense–housing, environment, food.

The Louisiana Climate

"Hopefully, we can get people to organize around health needs and go on to make other decisions about their life situations. Some plantations are quite the same as in slavery times and families live in utter isolation under

NEW BEGINNINGS IN LOUISIANA

A new spirit is stirring in the sugarcane country of southern Louisiana. In a land where for generations change has seemed impossible, people are beginning to find self-esteem and hope.

Cane still dominates the countryside – its economy, politics, education, its human and inhuman relationships, even the quality of its justice. Cane still keeps the rich rich, and the poor frightened, divided, debt-ridden, and chained to the land in a condition little removed from slavery. Yet today things are not quite the same.

The driving force for change is a coalition of blacks and whites called the Southern Mutual Help Association. The word "mutual" is deeply felt; it is meant to take in a whole society of poor. Founded three years ago by a small group including a civil rights lawyer, a priest, a nun, the organizer of a poor people's credit union, and some venerable trade unionists, SMHA is the only private organization in the southern half of Louisiana with a biracial board of directors.

With moral and financial support from the Rural Advancement Fund, the Normandie Foundation, and the Alliance for Labor Action, SMHA has attracted large numbers of dedicated students from nearby and faraway universities who have come there to help and to learn.

Victory in Rabbit Hill

Little by little, people who have never had anything are learning that they can do something for themselves. For instance, there is Rabbit Hill, a ramshackle black satellite of Abbeville. Its 200 families (median income $1,800) are enjoying the flush of the first victory over authority they have ever experienced. For years, they had been resigned to their decaying houses and muddy streets. Then, spurred on by SMHA, they formed a Rabbit Hill

FARM CO-OPS BREAKING NEW GROUND

The rich red-brown soil has been turned, the seeds are planted, and the air is filled with an excitement felt by everyone connected with the farmers' cooperatives in Halifax County, Virginia, and Burke County, Georgia. New ingredients are large new tractors, irrigation equipment, land in cultivation that has lain fallow for years, organic fertilizer. And there are demonstration plots where all kinds of experimentation is going on.

Vegetables, produced in huge quantities, are replacing the dwindling cotton and tobacco crops. Straightneck squash, bell peppers, cucumbers, beans, carrots, celery, tomatoes—to name a few. And markets? Prospective buyers are coming around from as far away as New York, Detroit, and even California. Some come from canneries and freezing plants; others seek sources of good fresh produce.

The combination office-warehouse-meeting rooms of the co-ops buzz with activity. Farmers coming to pick up supplies. Wives and young people dropping by to discuss arrangements for the hundreds of additional harvesters who will be needed at picking time. Experts from neighboring land grant colleges to test soil and make recommendations. All this activity is the culmination of months of careful planning by the co-op members.

Concentrated Effort

Substantial interest-free loans from the Rural Advancement Fund's special reserves set aside for this purpose have made possible this massive concentrated effort to build a vigorous, economically sound community to replace the dying one-crop system. RAF staff members, led by executive director James M. Pierce, have been on hand constantly to bring guidance and technical assistance.

In Burke County, largest and poorest county in Georgia, the Eastern Georgia Farmers Cooperative has fixed contracts with pickling, canning, and freezing plants. More than 2,000 acres of vegetables have been planted, and early crops were ready for harvesting by late May.

In Halifax County, the Southern Agricultural Association of Virginia (SAAV) is concentrating on vegetables for the fresh market. Close to 1,000 acres have been planted. Delayed by wet weather, the farmers got back on schedule by working nights under floodlights attached to their tractors.

Careful cost records are being kept, and an experimental farm will test a variety of vegetables and organic methods.

FARM LABOR NEWS

THE FLORIDA CITIZENS COMMITTEE ON AGRICULTURAL LABOR met March 27 in Belle Glade with a representative group of 150 present, including many migrants. James Pierce spoke on the need for farm workers to organize to achieve the dignity and wages to which they are entitled. The meeting also dealt with housing, sanitation, job security, food needs, and health. It was organized with help from Stanley Hamilton, NSF's special representative for farm labor in Florida.

A PILOT MIGRANT PROJECT, aided by an RAF loan, is developing a cooperative association of farm workers in the East Coast migrant stream, in an attempt to establish wage standards and improved conditions. William H. Johnson, NSF Board member and director of the Community Action Migrant Program, Fort Lauderdale, Florida, is working closely with the program.

SENATOR ADLAI E. STEVENSON, III, new chairman of the Senate Subcommittee on Migratory Labor, has been urged by an NSF delegation to hold field hearings on the East Coast to deal with the migrant stream in that area.

THE UNITED FARM WORKERS ORGANIZING COMMITTEE has announced that its dispute with the Teamsters has been resolved, with UFWOC granted jurisdiction over the field workers. Accordingly, UFWOC has discontinued the boycott of Teamsters union lettuce. The boycott of nonunion lettuce continues, and consumers are asked to buy only lettuce in boxes bearing the Aztec Eagle union label. UFWOC also urges avoidance of strawberries in unmarked boxes, to protect the rights of workers at Naturite. This company, long in dispute with the union, now ships in boxes without a grower's name.

BORN TO REBEL.

An Autobiography.
By Benjamin E. Mays
Illustrated. 380 pp.
Charles Scribner's Sons. $10
(RAF Price $6.50)
Reviewed by Fay Bennett.

The life of Benjamin E. Mays is one of unswerving dedication to breaking down the barriers that keep people from understanding each other and from realizing their fullest potential. It is a continuous encounter with people and institutions in the search to open doors, to develop dialogues, to challenge people to strive for the highest goals.

Born near Greenwood, South Carolina, son of a poor cotton farmer, Mays credits his mother with having early inculcated in him a feeling of self-worth, so that he grew up believing he was "somebody" despite the riding of the Klan, the lynchings, the brutality and humiliation which constantly hung over black people.

Though his father wanted him to stay at home to help with the farming, young Mays was determined to get an education. With interruptions for work to earn tuition and living expenses, he studied at State College in South Carolina, Virginia Union, Bates, and the University of Chicago where he earned his doctorate in theology.

Although he played an important role in ecumenical and interracial religious movements, it was as an educator, and more particularly as president of Morehouse College, that Dr. Mays made his greatest impact. With the skill, determination, and perseverance which he brought to everything he did, he changed Morehouse in his 27 years there from a poor, insignificant college to a first-rate institution whose graduates include scholars and leaders known throughout the land. He strove for excellence himself and encouraged it in his students and faculty.

Here is the story of a wise and good man, a persistent and persuasive man, a man of deep faith. The National Sharecroppers Fund is fortunate indeed to have such a man at its helm in the critical years ahead.

(More reviews on pages 2 and 4)

NEW NSF OFFICERS CHOSEN

Dr. Benjamin E. Mays of Atlanta, distinguished scholar, educator, and champion of human rights, has been elected chairman of the National Sharecroppers Fund, it has been announced by Dr. Shirley E. Greene, executive committee chairman. Dr. Mays had previously served as secretary-treasurer.

For 27 years president of Morehouse College and currently president of Atlanta's Board of Education, Dr. Mays has carried on a lifelong battle for justice and equality. His recently published autobiography, "Born to Rebel", is reviewed elsewhere in this issue.

Long associated with movements to help the rural poor, he was co-chairman of the Citizens Board of Inquiry into Hunger and Malnutrition and was a member of the National Advisory Committee on Farm Labor.

Dr. Mays succeeds former NSF chairman Frank McCallister, whose untimely death on October 21, 1970, cut short an active career of service in the cause of world peace and the rights of the oppressed. Associated with NSF since its inception, Mr. McCallister at the time of his death was director of Roosevelt University's Labor Education Division.

Vera Rony, coordinator of the Equal Opportunity Program at the State University of New York at Stony Brook, has been chosen to succeed Dr. Mays as secretary-treasurer, and Rev. A. J. McKnight of Lafayette, La., director of the Southern Cooperative Development Fund, has been named a vice-chairman. A. Philip Randolph, president emeritus of the Brotherhood of Sleeping Car Porters and a member of the AFL-CIO executive council, continues as a vice-chairman.

LOUISIANA CLINIC IS CROWDED

FRANKLIN, La. – Business is good – almost too good – at the family health clinic here.

Since it was opened a few months ago by the Southern Mutual Help Association (SMHA), the rural poor of St. Mary's Parish have crowded the waiting room seeking long-overdue medical and dental attention. The reaction is a measure of the need in southeastern Louisiana where the average farm worker's income is $2,600 and decent health care is a luxury few can afford.

"We have too many patients and not enough staff," says Sister Anne Catherine, SMHA executive director and RAF field representative. "On one recent day, 90 persons came to the clinic. Our dentist says that 99 percent of them had never been to a dentist before and their troubles were far advanced. Most people our doctor sees have ailments that have worsened over many, many years when no one cared."

Clinic administrator Rose Mae Broussard says that both doctor and dentist find rampant malnutrition in most patients. Children are automatically treated for parasites, since worm infestation is endemic to shack living on sugarcane plantations. Yet the Department of Agriculture last year denied a pay raise to plantation workers earning $1.50 an hour at the same time that hundreds of thousands of dollars in price-support subsidies were being paid to owners.

Money the Key

The Rural Advancement Fund has been assisting SMHA to attack generations of neglect that has undermined black lives physically, educationally, and vocationally. The members of SMHA, both black and white, are struggling against enormous odds to make state and federal agencies responsive to local need.

EASTERN GEORGIA CO-OP REPORTS PROGRESS

WAYNESBORO, Ga. – The first organic crop in Burke County history is on its way to market, and the outlook for profit is so good that six or eight members of the Eastern Georgia Farmers Cooperative may begin to plant organic crops later this year instead of waiting until 1973.

The experiment in organic farming began this spring on 30 acres of EGFC leased land. Early in June, three truckloads of vegetables were shipped to market. The shipment included 94 bushels of tomatoes, 50 to 60 pounds per bushel, grown on 1.3 acres of land. The price paid for the tomatoes was $8.70 for 30 pounds.

The co-op is also growing cabbage, carrots, spinach, and other vegetables, both for sale on the organic market and to demonstrate new techniques to the 215 co-op members. Don Blood, RAF field coordinator who works closely with the local farmers, had studied the results of organic production last year at the RAF-assisted co-op in Halifax County, Virginia, in preparation for the Georgia experiment. EGFC is using organic seaweed-based fertilizer which not only fertilizes but functions as a powerful nontoxic insect deterrent.

"Everybody here is real enthusiastic about the new possibilities in organic production," Blood reports. "At the same time, the co-op is going ahead with its normal production of peas, squash, and cucumber for the canneries. Farmers have contracted to plant about 2,300 acres, and some of them are tripling last year's output. The co-op has demonstrated that it can make a real difference to struggling farmers."

Production and Income Up

Increased production by co-op members has meant more jobs, especially for young people, in the county.

Working with the Burke County farmers this year is a new RAF field representative, Ed Frey, a former VISTA volunteer. He came to a co-op that three years ago was little more than a hope among farmers trapped in the poverty cycle of cotton and debt. Now, farm incomes are rising. With RAF assistance, the co-op has purchased tractors, harvesters, and irrigation equipment. It has constructed a metal warehouse at its headquarters outside Waynesboro which is the beginning of a much needed processing plant. It will cost $110,000 to complete the plant where both organic and regular crops can be frozen and packaged. This will eliminate middleman expenses and reduce the risks inherent in fresh vegetable production.

Tenants Outlook

NATIONWIDE TENANTS RIGHTS PROGRAM

AMERICAN FRIENDS SERVICE COMMITTEE 711-14th Street, N.W., Suite 711, Washington, D.C. 20005 (202) 347-3358

VOLUME 1, NUMBER 4 AUGUST 1969

Who Says Things Are Changing In Detroit?

"I don't," says Ron Scott.

The former Detroit Chapter Defense Minister of the Panthers, Ron Scott, is leading some 2,000 families in a successful rent strike which has resulted in $100,000 back rent being withheld in escrow. Scott is the Chairman of the Jeffries Action Committee and a leader of the citywide rent strikers.

The Citywide rent strike in Detroit is being carried on in seven of eight Public Housing Projects there. According to Ron Scott who is also a member of the Board of Tenants Affairs, the barracks style Public Housing in Detroit is miserable and quickly becoming delapidated. "We had to go on strike in February this year because of the increase in rent of about an average of $10 a month in the Jeffries Public Housing Project," stated Ron Scott.

* * * *

The striking tenants also claim that the Housing Authority delayed the implementation of a new State law which provided for the setting up of "Tenants Affairs Board." The Tenants Affairs Board which is composed of 16 tenants, has 8 members appointed by the Mayor and 8 elected by the tenants. Ron Scott told NTRP Director, Tony Henry, during his visit to Detroit on June 27th, that the Housing Authority delayed the setting up of the Tenants Board in order to effect rent increase before setting up the board. The board, however, has veto over decisions by the Public Housing Authority.

* * * *

Another game in the rent increase involved the Detroit Welfare Department. The Welfare Department had claimed that they had no money to increase general welfare payments, but immediately increased welfare payments to the amount of the increase in rent, which goes directly to the Public Housing Authority.

Scott also said that Senior Citizens

(Continued on page 2)

BEAUTIFUL AMERICA?

A Battle At New Orleans

The New Orleans 8,000 members strong tenants union and the Welfare recipients there will be holding a mass demonstration at Louisiana's capital of Baton Rouge on August 5th, 1969.

The union's president, Shirley Lampton, who will be leading the demonstration said that at least 1,000 tenants, most of whom are welfare recipients, have had their welfare payments reduced for the month of July by 42 percent.

* * *

Mrs. Lampton added that the Department of Welfare in Baton Rouge has announced that welfare payments will be reduced in August by 52.8 percent.

The maximum welfare payment in Louisiana, it should be pointed out, is $163 per month.

Lampton stated that the demonstration is planned to draw the attention of the authorities concerned to the poor condition the welfare recipients are in.

Meanwhile the New Orleans Housing Authority has allowed those welfare recipients whose payments have been cut to not pay rents until the differences in the payments have been reconciled.

* * *

The struggle going on in New Orleans might not get the press coverage that Andy Jackson's and Jean Lafeet's little shenanigans with the Red Coats got, but which has more significance to organized tenants.

The battle lines in this struggle are clearly drawn. The Lousiana Welfare Commission has made an aggressive act upon its welfare recipients. Its declaration to reduce their welfare payments poses a serious threat to their livelihood. The New Orleans Housing Authority was an equal partner with the welfare commission in this struggle against the New Orleans Tenant Union and the New Orleans Welfare Rights Organization, until its offices were invaded by fifty determined demonstrators of the 8,000 members of the tenant union, in April this year.

* * *

Mr. J. Gilbert Schieb, the director of the local housing authority, had previously refused to talk with any member of the tenant union or the welfare rights organization.

He had refused to listen to their demands that if welfare payments were reduced by 27 percent, as the Welfare Commission was asking for, then rents should be reduced by the same proportion. Yet during the confrontation in his offices, he revealed that the Housing Authority was willing to consider rent reduction within their regular schedule, but said that minimum rent payments could not be reduced because there was no provision for that in their contract with HUD.

NOW IT'S "RENT STRIKES"

It used to be that if a tenant failed to pay his rent, the landlord had him evicted.

Now, in city after city, a new pattern is emerging. Tenants protesting deteriorating services and rising rents are banding together, holding back all or part of their rents and taking the landlord to court.

Poor blacks are involved—and middle-income whites.

The problem-ridden housing industry, beset by inflation and the squeeze on money, now is facing another threat from apartment dwellers—rent strikes.

As the housing shortage worsens, tenants in many cities are banding together to demand better living conditions and fight rent increases. To enforce these demands, they often refuse to pay rent.

When landlords try to evict the protesting tenants or force them to pay, the tenants have been winning a surprising number of cases.

Sometimes, State and local agencies support the tenants. Laws are being rewritten to give legal sanction to rent strikes under certain conditions, usually when there are housing-code violations. About 15 States have laws providing for a form of rent withholding or rent strikes.

Tenant unions are being organized to run the strikes and to bargain with the landlords. A National Tenants Organization has been formed. It claims 85 member groups in 38 cities, and more ready to join. A majority of the groups involve low-income tenants, but a growing number include middle-income organizations.

A recent survey showed that, so far this year, tenant unions have acted on 67 occasions in 29 cities. Nearly 1 in 4 of these actions was taken by middle-income groups.

A voice in management. Some organizations are demanding tenant participation in management—in private and public housing. They seek control over such things as maintenance, operating rules and selection of new tenants. One result is that a number of landlords are said to be moving out of inner-city operations.

Typical of the middle-income groups organized in disputes over rents is the Tiber Island-Carrollsburg Square Tenant Council, Inc., formed this year in Washington, D. C., after a rent increase.

Its members are occupants of new apartments—mostly less than 4 years old—in the Southwest section of the city, an area being advertised as a showcase for urban renewal in the nation's capital. A majority of the tenants are college graduates. Many help to run federal social-welfare programs.

The rent strike developed with the tenants withholding and placing in an escrow account the amount of the increase they were challenging. Several lawsuits followed, mainly around the issue of whether the landlord—Frederick W. Berens Sales, Inc.—had obtained necessary Federal Housing Administration approval for the increases and whether the increases exceeded the limits set for profits on properties with FHA-guaranteed mortgages. This still is in dispute.

Fighting inflation. Charles W. Sherren, vice president in charge of property management for Berens, one of the major management firms in Washington, says:

"I think housing is where the average person comes face to face with inflation in its most striking form—with a rent increase. Organizing this way is the easiest way for them to fight inflation."

—USN&WR Photo

Anthony R. Henry, of National Tenants Organization, says subsidies for private housing are necessary. Organization claims 85 member groups in 38 cities.

Frequently, however, the issue boils down to one question. The landlord, in either private or public housing, says he can't make necessary repairs without increasing rents. The tenant says he can barely afford present rates. In many cases, officials say, both are correct.

In St. Louis, for example, 1,000 families have withheld rents since February and brought the public-housing authority to the verge of bankruptcy. The strike was triggered by a rent hike, but tenants also are protesting broken windows, dirt, bad wiring, rats—generally unfit living conditions.

Even with the $400,000 the strikers have put into an escrow fund, officials say they couldn't make repairs. To do so, they contend, they must raise rents. Strikers say they can't pay higher rents. In most St. Louis public housing, 50 per cent or more of the tenants are on welfare. One outgrowth of the rent strike in St. Louis has been the ouster of the top public-housing official.

Range of complaints. A rent strike in Muskegon Heights, Mich., last year resulted in tenants' getting some voice in the selection of a majority of the public-housing authority. The city of 25,000 has a 52 per cent black population. East Park Manor is a 200-unit public-housing project.

In 1967, the tenants conducted a seven-month rent strike over a variety of complaints about living conditions and operating rules. It was settled with an agreement recognizing the East Park Manor Tenants' Organization, providing a new rent scale, grievance procedures and an agreement on repairs.

A year later, another strike began. Tenants complained that only a few repairs had been made. The housing authority threatened to put 89 families in jail.

At the last minute, the mayor reached an agreement with the strikers calling for the ouster of three of the five public-housing commissioners. The tenant group then was given authority to help select new commissioners.

In Philadelphia, the housing authority recently signed a formal agreement with tenant groups representing two large projects. This gives the tenants a major role in managing the projects, including selection of the employes, setting rent schedules and planning improvements.

NOW IT'S "RENT STRIKES" BY APARTMENT DWELLERS

Middle-income tenants of these modern apartments in Washington, D. C., called protest strike after rents were raised. Such strikes are spreading around country.

The official policy of the Department of Housing and Urban Development is to give public-housing tenants a larger role in management.

"A tenant council can be a big help to a landlord, either public or private, if he learns to get along with it," says Richard Van Dusen, Under Secretary of HUD. "There is a crying need for competent management of multifamily housing, and the tenants can help provide it."

One who disagrees with Mr. Van Dusen is Albert Chaiken, former owner of the Trenton Park apartments in Washington's Southeast section. As a result of his dealings with a tenant union and a rent strike, he is disposing of all his holdings in the District of Columbia.

"The tenants came up with the demand that they have a say in the selection of maintenance men, janitors and the like, and help decide who can live there," says Mr. Chaiken. "In any business I ever heard of, the man who takes the risks decides how it is to be run. I'm not going to bargain with anyone about that. The District is in a revolution, and I can't fight a revolution."

Trenton Park is a complex of 160 apartment units, completed in 1962. With a swimming pool, playground and other facilities, it was occupied originally by middle-income whites.

In 1964, the District Government enacted an open-housing ordinance. At that time, the Southeast area was rapidly becoming predominantly Negro. Within less than 18 months, Trenton Park became almost entirely black.

Al Gross, 30, a college graduate, was one of the blacks who moved into Trenton Park with his wife and one child in 1965. He is president of the Trenton Park Tenants Council and is employed in the personnel-training department of United Air Lines. He pays $139 a month, plus utility charges, for a two-bedroom apartment.

Eroded standards. "In the beginning, the landlord was very selective about whom he let in," says Mr. Gross. "You had to put up a $100 deposit. They checked credit references, size of the family and so forth. But as the whites moved out, rents were increased for the blacks who replaced them. In some cases, very large families moved in."

Mr. Chaiken says:

"We reached the point where we couldn't get enough people to meet the criteria we had set. The landlord has to meet his mortgage payments. He can't sit around and wait for the right kind of people to show up.

"So, rather than stay vacant, we had to lower our criteria."

The rent increases were necessary, says Mr. Chaiken, because of increasing taxes and other expenses.

"For two or three years we had these higher rents, with 99 per cent occupancy," says Mr. Gross. "It was overcrowded. There were too many children. The landlord wasn't keeping the place up. It was slipping into a slum."

Says Mr. Chaiken:

"There was very much vandalism. The problem here was a lack of regard for property on the part of certain tenants which created a situation where we couldn't keep up the maintenance on a normal operating basis."

When Mr. Chaiken asked for help in the maintenance, the tenant council was formed in the spring of 1968. Within months, a rent strike began. By autumn, Mr. Chaiken had turned the property over to the FHA, as court proceedings dragged on.

"At first, we weren't really asking very much," says Mr. Gross. "We wanted light fixtures replaced, the grass cut, janitorial services, the playground kept up, broken windows fixed, plumbing repairs—that sort of thing."

Now, even with the federal agency beginning to make repairs, the tenants are not willing to settle for that. Says Mr. Gross:

"We are going to have an agreement that gives us some say in running the apartments. We want to be involved in who comes in. We don't want to let in just anybody and let it become rundown again."

Forced abandonment? Mr. Chaiken says he is typical of many landlords who either are moving out of rental operations in inner cities or plan to get out when they can.

This is a major criticism of the rent strikes—that by demanding costly repairs they sometimes force the owner to abandon his property. This usually results in less available housing and makes the housing shortage worse.

"There is a good deal of money to be made in slum housing," says Anthony R. Henry, executive director of the National Tenants Organization, "but not if you keep the property up. The money can be made without raising rents if you let the maintenance go. If anyone complained in the past, they were evicted. Now, it doesn't always work out that way.

"I don't believe you can profitably operate low-income housing, keep it in proper condition and charge reasonable rents without some sort of subsidy. For this reason, we are not encouraging tenant unions to take over housing. They don't have the money to make major repairs any more than the former landlord did. The economics don't change."

A long-range goal of NTO, says Mr. Henry, "is to force the federal, State or local government to take over housing for low and middle-income families where the landlords have failed to operate it properly, or subsidize someone who will operate it properly."

Occupants of Trenton Park apartments in Washington are demanding a voice in management. Former owner Albert Chaiken, below, says the "man who takes the risk" should make decisions. He has turned units back to FHA.

—USN&WR Photos

Al Gross, of Trenton Park Tenants Council, says rents went up when blacks replaced whites, repairs were ignored and the project "was slipping into a slum."

Although tenant unions began mainly in the East and Midwest, chiefly in New York and Chicago, Mr. Henry says they now are springing up all across the country. The membership is primarily Negro, but there are a good many white members—both poor and middle income.

Why is all this happening now?

"It didn't come about before because most people didn't have access to lawyers," says Mr. Van Dusen of HUD. "Now, the poor have access to first-class legal talent, and there is a new look being taken at the landlord-tenant relationship in courts all across the country."

The lawyers, mostly, are provided by the Neighborhood Legal Services, sponsored by the Office of Economic Opportunity. Some come from legal-aid activities of local bar associations.

Even when the laws do not specifically authorize rent strikes, they can be made to work.

There is no such law in Washington, D. C. However, a series of favorable court decisions have, in effect, legalized the practice and ruled out retaliatory evictions. Similar decisions are being handed down in other areas.

Playing for time. Even when the courts are not sympathetic, a rent strike can be effective, simply by making use of the delays built into court processes.

"What happens is that the tenants make the law work for them instead of against them," says Mr. Henry.

"The landlord used to say, 'If you don't like it, take it to court,' and most people would find it too costly. Now, tenant groups are dragging the court action out and making it too slow and costly for the landlord, who isn't collecting any rents while the court action goes on."

Rent withholding and rent strikes are not the same thing.

Rent withholding is done by Government agencies. For example, city officials declare a welfare recipient's housing unfit. Welfare officials then withhold his shelter allowance until the building is brought up to standard. Meanwhile, the tenant may not be evicted.

In a rent strike, tenants simply withhold the rent. Usually, it is held in some kind of escrow fund. This fund may be controlled by the tenants, by the courts or by some other agency. If the tenant union is energetic and well organized, little is lost. If the fund is loosely run, the rents may disappear.

Several States, including New York, Illinois, Massachusetts, Michigan and Connecticut, have laws which permit the courts to place a building in control of a receiver—a city agency, nonprofit group, tenant council or some other party. The receiver then has first claim on all rents until repairs are made.

Bargaining pressure. But, increasingly, the demands of tenants are going beyond merely a decent place to live. They want to bargain about rents, help make decisions on management of properties and even have a check-off system for tenant-union dues as a part of rent payments.

With inflation continuing and housing shortages worsening, many landlords and Government officials agree with Mr. Henry that tenant unions are bound to increase in the years ahead. More and more, landlords will be obliged to bargain with tenants over rents and living conditions just as other businessmen bargain with workers over wages and working conditions.

Further reproduction prohibited.

VOLUME 2, NUMBER 1 JANUARY 1970

CONGRESS LIMITS P.H. RENTS TO 25%

The National Tenants Organization applauds the inclusion of the hard fought "Brooke amendment" into the 1969 housing act. We are happy to see the bill pass with the following provisions aimed at helping poor tenants.

The Conference Report No. 91-740 Summarizes the Bill as follows:

The Senate bill contained a provision not in the House amendment adding a new section 24 to the U.S. Housing Act of 1937 authorizing up to $75 million per year in contracts for annual rental assistance payments to public housing agencies to cover the amount by which rental charges allocated to a unit exceed 25 percent of the tenant's income and to provide improved operating and maintenance services.

Both the Senate (sec. 206(a)) and House (sec. 210(a)) bills also contained a provision making it clear that the Secretary of HUD has authority to fix the amount of annual contributions in excess of debt service requirements of the project so long as the fixed contribution does not exceed the statutory annual maximum.

The Conference substitute retains the basic concept of section 211 of the Senate bill by generally limiting rents that may be charged public housing tenants to no more than 25 percent of their income. It provides Federal funds to cover the amount by which the appropriate rental charges exceed 25 percent of the income of the tenant and to cover the cost of adequate operating and maintenance services.

The conferees were concerned, however, that in a number of jurisdictions the benefits of limiting the rent which may be charged a tenant of public housing would not insure to those tenants receiving public welfare assistance, but be captured by the public agencies administering the programs of assistance to these families.

The conferees realize the impracticality of attempting to provide through additional public housing subsidies the funding needed to make adequate the welfare payments provided by the various States. The conferees, therefore, have made clear that the requirement that the rents fixed by public housing agencies may not exceed one-fourth of a tenant's income shall not apply in any case in which the Secretary of HUD determines that limiting the rent of any tenant, or class of tenants, will result in a reduction in the amount of welfare assistance which would otherwise be provided to such tenant, or class of tenants, by the public agency.

The conferees are disturbed by the growing practice of stretching an inadequate welfare budget by placing in public housing increasing numbers of families who cannot pay even the operating costs of the unit they occupy. The conferees are hopeful that within the context of the welfare program, some means can be found to provide as much support for a welfare family in public housing as would be provided for that family in private housing. Accordingly, the Secretaries

Winston-Salem — The Southern Movement

By Ed Darden

"I call on you all to come with me and stand by me, and we will call the terribliest rent strike this city has ever known, we'll call it all over North Carolina if necessary."

These are the words of Mr. Charles Smith one of the four representatives from the National Tenants Organization Southern Region. Charles "Smitty" Smith is a Martin Luther King kind of Southerner. He came to the N.T.O. convention table banging and preaching and left as an elected representative and more dedicated to the struggle for tenants rights.

As a part of Winston-Salem, N.C.'s preparation for Housing Action Day (H.A.D.) Mr. Smith called a city-wide rally to both dramatize the problem of the poor and to set the stage for the beginning of a city-wide organization. This new group would be made up of poor people and aided by those from white and black people who feel the need of the Poor and have resources to contribute. In response to a request from Mr. Smith for a National representative, Ed Darden, N.T.O. Program Direcotr was sent to address the meeting.

Early Monday evening, December 8, 1969, some one hundred and twenty (120) persons crowded the basement of St. James A.M.E. Church. The array of folks who came out to talk about housing ranged to include agency workers and directors, several area ministers, local businessmen, the Black Panthers, lawyers, and social workers . . . However, over half of the total crowd were poor tenants, both Black and White, from public and private housing who came seeking relief from their exploitation.

(continued on page three)

TENANTS BACK PANTHER RIGHTS

Lake Meadows Residents' Council, Chicago, Illinois plans to join with other Chicago Organizations to voice disapproval of what appears to be the murder or assassination of Black Panther Party leader Fred Hampton. Council Chairman, Bill Boone says, "This is not to say that we believe in the political philosophy of Fred Hampton or the Black Panthers. This is to say that Fred Hampton — like Dr. Martin Luther King — like any other Black man or woman — has the right **and the obligation** to speak out and defend themselves, as well as to espouse their philosophy or beliefs."

National Tenants Organization
425 Thirteenth Street, N.W.
Suite #926
Washington, D. C. 20004

Phone: 347-3358 (202)

The National Tenants Organization officially came into being at its first national convention in October of 1969, in St. Louis, Missouri. The N.T.O. is national in scope, being made up of local tenants groups from across the country. The local affiliates of N.T.O. contain a cross section of American tenants, in public and private housing, from low, to moderate and middle income.

The National Tenants Organization is a democratically governed body, Policy decisions are made by its Executive Board, which is composed of national and regional officers elected at its National Convention. In order to qualify for affiliation with N.T.O., a local tenants group must be democratically governed, composed of tenants, engaged in the organizing of tenants to improve housing and have at least ten (10) active members.

The National Tenants Organization serves as a direct communication link between local tenants groups across the nation. Thus it contributes to an atmosphere where tenants, through communications with their counterparts in other areas, are encouraged in their efforts and benefit from the experiences and resources of their fellow tenants.

In addition, the N.T.O. has been able to provide tenants direct access to the top policy makers of the Department of Housing and Urban Development. This link automatically places tenants in a position to affect the decisions that affect their lives. The underlying goal and motivation force behind the N.T.O. is the promotion and furtherance of the social, political, and economic rights of all poor and exploited tenants in the United States and her possessions.

The National Tenants Organization serves as a resource center for information, technical assistance, and tenant activities coordination by handling questions, inquires, and problems related to housing and tenants rights. Basic to this role is the Tenants Outlook, the official publication of the N.T.O. The Tenants Outlook gives both detailed analysis of the tenant-housing situation as well as full coverage of activities on the local level across the country.

The National Tenants Organization hopes to train and place tenant organizers in their home communities. It also seeks to develop models for organization and strategies for action by local tenant groups, not only for the immediate future, but for years to come. Although a new type of organization; the activities of the National Tenants Organization are having and will continue to have a tremendous affect on the future of housing and tenants in the United States.

ANOTHER CRISIS IN ST. LOUIS

10,000 Without Heat, Water, Gas

About two hundred years ago or slightly more an elderly printer, who wrote for Poor Richard's Almanac, Ben Franklin wrote, "for want of a nail the shoe was lost, for want of a shoe the horse was lost," and so forth until a great battle was lost because somebody neglected something as minor as a nail.

In St. Louis, a great city on the Mississippi River, the folks either haven't gotten around to reading Poor Richard or didn't understand what he was talking about. In St. Louis a situation reached crisis state when something as minor as a few repairs were neglected.

During the recent cold spell that sent temperatures below zero in some parts of the country, the ten thousand tenants of the Pruitt-Igoe public housing development in St. Louis were without heat, water and electricity.

The cause of the utilities breakdown has been traced to the near-zero temperature that the city was experiencing.

William H. Schawacker, the director of housing for the St. Louis Housing Authority, is reported to have said that the problem began when water pipes that were frozen during the near zero temperature began to thaw. The pipes burst and the water flooded the apartments halls and stairwells. The water then seeped into electrical transformers, shorting systems and leaving the residents without power for light or heat.

Mr. Schawacker understandably called the situation "a real emergency" and added that "we're never had anything to this extent before." Another housing official is reported to have termed the situation "a real madhouse", as ten thousand men, women and children found their homes; halls and stairwells covered with layers of ice that were several inches thick and their windows and air vents clothed in sheets of frozen water.

An underlying reason for the utilities failure is the condition of the 33 buildings that make up the complex. They were long in need of repairs. Thousands of broken windows in the buildings were not fixed, therefore the cold was allowed to get into the apartments utility-rooms where the damage began. Another significent reason is the poor construction of the apartment complex itself.

Clarence Swarm, tenant chairman of the Authority's board of commissioners, while supervising the emergency repairs to the buildings' utilities, said to the press, "We are seeing the results of poor workmanship in the initial construction."

Arthur J. Kennedy, the local Model Cities director, has blamed the federal government for "creating this mess and then walking away from it." He explained by saying that: "They haven't provided the money we need to make these places livable." "They crowd thousands into a small area and leave it".

The federal government did respond to the crisis as did local groups that contributed blankets, candles and other articles necessary for the emergency survival of the ten thousand people

(continued on page three)

Harlem, Florida Tenants Fight For Tenant Control

By JOHN HAMPTON

The Harlem Tenants' Association, Harlem, Florida has won the first round in its' fight for tenant controlled Housing. As a result of a two month old rent strike against the Clewiston Authority, the Harlem Tenants' Association has been offered the entire Harlem Housing complex of 200 shacks.

Having its roots in the inhuman living conditions Harlem, Fla. Tenants were forced to endure, for example, no indoor plumbing, no hot water, uninsulated tin roofs and exposed electrical wiring. The HTA rent strike was sparked by a November 1st rent increase of $1.75.

The offer by the Clewiston Housing Authority to deed the entire Harlem Housing complex over to the Harlem Tenants' Association took place on December 31, 1969.

The Harlem housing complex, formerly owned by the U. S. Sugar Co., was given to the City of Clewiston in November, 1968.

In keeping with the wishes of U. S. Sugar, the Harlem Housing complex is to be used for low-cost rental hous-

(continued on page three)

SQUAT IN ! ! SQUAT IN ! ! SQUAT IN ! !

Ted Parrish was arrested, tried, convicted, and sentenced for his activities during a Squat-in in Boston, Mass. When first arrested he faced a possible 2 year period in jail. But, because of the tremendous support he received from the people of his community actively working for his freedom, Ted Parrish has been released and continues his work fighting the oppressors of poor and exploited peoples.

During the short period he did spend in the Charles Street Jail he wrote two letters. The first—**The Housing Crisis and Squat-Ins** will appear in a 3 part series. The second—**Community Response to Oppression** will also oppear. The first of these installments begins on the back page of this issue.

March 17, 1970

Mr. Emory Via, Director
Resource and Development
Southern Regional Council
5 Forsyth Street
Atlanta, Georgia 30303

Dear Mr. Via:

This is a letter of introduction to the National Tenants Organization. The NTO is a new organization; founded at its first convention in October of 1969. Enclosed, you will find a variety of material telling of the NTO's activities, policy-making structures and constituency. Hopefully, this material will give you a clear indication of the kind of things the NTO is attempting to do in the area of tenant organizing and tenant rights.

For purposes of the NTO's internal structure, we have divided the country into four regions: Eastern, Midwestern, Western and Southern. In each of these regions, the NTO tailors its programs and activities to meet the needs created by varying tenant and housing problems. Presently, we are in the process of organizing the first NTO Southern Regional Conference to be held May 15th - 17th, 1970, in Nashville, Tennessee. We hope to bring together a representative cross-section of Southern tenants or organizations, tenant and community organizers and persons generally interested in housing and tenant problems.

To date, the National Tenants Organization has operated on a small one year grant of $50,00 from the American Friends Service Committee. While the A.F.S.C. grant has been most helpful, it has not provided enough funds for activities beyond the normal operation of our headquarters office in Washington.

OFFICERS: *Chairman*, Jesse Gray, New York • *Vice-Chairmen*: (Eastern) Rose Wylie, Philadelphia; (Midwestern) Jean King, St. Louis; (Southern) Mary Copeland, Nashville; (Western) Catherine Jermany Los Angeles • *Secretary*, Freddie Mae Brown, St. Louis • *Corresponding Secretary*, Pearl Moore, Chicago • *Financial Secretary*, Ted Valez, New York • *Treasurer*, Mary Rogers, San Francisco • *Sergeant-at-Arms*, C. Marty Freeman, (Cleveland) *Midwest Representatives*: Margaret George, Cleveland;; Ed Roy Harris, St. Louis; Marcia Satter, Milwaukee; Ron Scott, Detroit • *Southern Representatives*: John Etta Cheers, Nashville; Monica Hunter, New Orleans; Shirley Lampton, New Orleans; Charles Smith Winston Salem • *Western Representatives*: John Brookins, Seattle; Virgil Burt, Los Angeles; Marcie Hubbard, San Antonio; Lupe Juarez, Albuquerque • *Eastern Representatives*: Eva C. Curry, Boston; William Goode, Baltimore; C. Wayne Hunter, Washington, D.C.; George Parrish, Washington, D.C.
STAFF: *Director*, Anthony R. Henry; *Program Director*, Edward M. Darden; *Information Director*, G. Ike Okoh.

It is estimated that a successful Southern Regional Conference will cost close to $2,000. Mr. John Lewis suggested that we contact you in the hope that the Southern Regional Council might be able to provide half of this sum. Any assistance you can provide will be greatly appreciated. Don't hesitate to contact me if you need further or more detailed information.

Yours in the struggle,

John S. Hampton

VOLUME 2, NUMBER 3 — MARCH 1970

HUD PROPOSES DRASTIC CHANGES IN P.H.

A draft being circulated by HUD for the 1970 Housing Act proposes drastic changes in the low rent public housing program. If adopted as law, the proposal would raise public housing rents, making them too high for many tenants to pay and would gradually turn public housing over to private groups.

A copy of the draft that the National Tenants Organization obtained through privileged sources proposes the elimination of the present subsidy of up to $120 per apartment per year for the handicapped, the elderly, very large families and families of very low income. It proposes using the "Brooke Amendment" subsidies to take care of those problems, but HUD has refused to use the money provided by the Brooke Amendment to provide full subsidies for this and next year.

Subsections 9(b) and (c) of the draft legislation require that rents be fixed on a uniform national basis in the low income housing program. "A basic rental charge would be established for each dwelling unit in an amount equal to the operating expenses (excluding debt service charge) attributable to the dwelling unit."

Rents would be either the operating expenses for the apartment or between 20 and 25% of income, *whichever is higher!* The proposed legislation states: "The monthly rental charged the tenant would be *the greater of**: (1) the basic rental charge or; (2) the amount determined by adding 20 percent of that portion of the tenant's income which is less than 40 per cent of the poverty income level for the area, as determined by the Secretary, and 25 per cent of that portion of the tenant's income which exceeds that level. The monthly rental charged the tenant could not, however, exceed a fair market rental based on the actual cost of providing the dwelling unit including the debt service charge attributable to the unit."

The legislation would not provide for the many exemptions, in determining income for rent purposes, that most local housing authorities now allow. "Subsection 9(d) would provide that in determining income for purposes of eligibility and determining the 'tenant's income contribution' under this section and the 'homeowner's income contribution' under the new section 10 homeownership program, income from

HOMEBUILDERS TAKE STAND TO SUPPORT N.T.O.

By Hulen Hill, Houston, Texas

The National Homebuilders Association met in Houston, in January, at their convention. They had a workshop on Low Income Housing.

Members of the local tenant association contacted Marcy Hubbard of San Antonio and Jesse Gray, chairman of the National Tenants Organization, with the idea of getting some of the tenant organization representatives into the workshop to express the views of the National Tenants Organization, since these are the people the plans and priorities will affect. Marcy Hubbard came to Houston immediately and plans were set into motion for getting support from other groups and organizations of the local Black and Brown Communities.

The organizers found that there was

(Continued on Page Three)

STUDENT CONFERENCE ISSUE: A BROAD BASED HOUSING STRUGGLE

"The objective of the present system is to polarize Black against white, so that it will be so much easier for Agnew to walk down the middle." "The Nixon administration has decided that the poor are no special class in the country. The government at this stage is saying to them 'we don't give a damn about you.'"

These quotes from Jesse Gray, N.T.O. chairman at the first national "Conference on Students and the Tenants Rights Movement" brought enthusiastic applause. The conference drew over 200 students from about 35 cities, coast to coast, to the campus of the University of Michigan in Ann Arbor. A delegation from Canada broadened the meeting to an international scope.

The conference was chaired by Peter Denton, student and organizer of the Ann Arbor Tenants Union, (the Ann Arbor Tenants last year held a $150,000 escrow account for the 2,000 people in the union on rent strike.) Workshops filled the Friday and Saturday sessions. Workshop leaders N.T.O. Board member Ed Roy Harris of St. Louis; Dick Soble, a leading lawyer and Leon Triplet from Detroit's United Tenants for Collective Action stimulated discussion and held the students complete attention even though frequent room shifts were made to accommodate the continually increasing number of participants.

The main point brought out in the workshops and the general session was the absolute necessity for the broadest community base possible to build the strength of the struggle for the difficult tasks ahead. Into this framework the students placed themselves and decided that students should not be

"Every Negro Who Discharges His Duty Faithfully Is Making a Real Contribution"

JIMMY BROWN

LENA HORNE

MILES DAVIS

RAFER JOHNSON

AS 19,300,000 U.S. Negroes seek equal employment rights, they are often met by an endlessly infuriating question: Are they really equal to whites in their abilities, or are they disqualified by some anthropological defect? The simplest, most frequent reply is to cite Negroes who have become famous. No one can argue about the extraordinary physical feats of baseball's Willie Mays, pro football's Jimmy Brown, Decathlon Champion Rafer Johnson and many other athletes. Similarly, the Negro has long held his share of the spotlight in the performing arts, as witness the success of such as Jazzman Miles Davis, Singers Lena Horne, Harry Belafonte and Leontyne Price.

But such an answer is too narrow. These celebrities work before audiences, which ask only to be entertained—and which are too often unwilling to accept the Negro as an equal beyond recognition of physical or artistic talent.

A better answer to the crucial question lies in the seldom publicized accomplishments of Negroes in more private vocations. Here the barriers are tougher, and the Negro is less apt to be prepared, since to him many such fields have long seemed closed. Yet in science and education, the professions and in business, the armed forces and Government, even in elective politics, individual Negroes have broken the barriers, earned positions of respect and trust, and become part of the U.S. leadership community (*see following pages*).

To be sure, about 60% of nonwhite families in the U.S. still earn less than $4,000 a year, against only 26% of white families. Negroes still comprise but 3% of the nation's 180,000 college teachers, 2% of its 230,000 physicians, 1% each of its 215,000 lawyers, 2,560,000 salaried managers, 130,000 editors and reporters. But there are now some 35 Negro millionaires in the U.S. The percentage of Negro families earning $10,000 a year or more has gone from one-half of 1% a decade ago to 5% (the percentage of white families in that category has increased from 5% to 19%). More than 16% of nonwhites hold white-collar jobs, against less than 12% a decade ago.

It is by the quality of their individual achievements and the example they set for others that successful Negroes contribute most. They effectively puncture those fallacious notions that the Negro somehow has not got what it takes "to make it." In fact, the successful Negro more often than not must have more of what it takes than the white who achieves an equal degree of success. Air Force Major General Benjamin O. Davis Jr. spent most of his four years at West Point as the only Negro there, often felt that he was spoken to only when someone was barking a command. Chicago Dermatologist Theodore Lawless fought off subtle rebuffs while an instructor at Northwestern University. When his hand was to be photographed giving an injection to demonstrate a new technique, he was asked to wear a surgical glove so his dark hand would not be seen. "I said, 'Hell no,' " he recalls, "and I never did."

Most of those Negroes who have achieved success feel that they are as much a part of the Negro protest movement as those who lie-in, sit-in and pray-in. "I feel I can serve best by doing a reasonable job here," says Negro Space Engineer Spencer Robinson. "My presence, I believe, has paved the way for others of my race." Carl T. Rowan, one of three Negro U.S. ambassadors, sees a broader implication in the success of individual Negroes. "Every Negro American in a position of responsibility who discharges his duty faithfully and well, whose conduct is laudable, is making a real contribution to the struggle by bringing along a segment of the white population," he says. "However, he is also obliged to speak out where speaking is called for."

HARRY BELAFONTE

WILLIE MAYS

LEONTYNE PRICE

IVAN MASSAR—BLACK STAR

BISHOP

Son of a dining-car waiter, Episcopalian John M. Burgess, 54, has served for the past year as Suffragan Bishop of Massachusetts.

LEVITON—ATLANTA

STATE SENATOR

Leroy R. Johnson, 35, defeated white Democrats in primary, became Georgia's first Negro state legislator since Reconstruction.

SURGEON

Grandson of a slave, Dr. Middleton H. Lambright Jr., 55, is the president-elect of the Cleveland Academy of Medicine.

ARTHUR SIEGEL

DIPLOMAT

A former Minneapolis newspaper reporter, Carl T. Rowan, 38, now U.S.'s youngest ambassador, greets Finland's President Kekkonen.

IVAN MASSAR—BLACK STAR

STATE OFFICIAL

Edward W. Brooke, 44, attorney general of Massachusetts, is highest elected Negro state officer in U.S.

DON CRAVENS

ARCHITECT

Orphaned at three, Paul Revere Williams worked his way through the University of Southern California, at 69 has won honors for his hotels and houses.

DEREK BAYES

POSTMASTER

Leslie N. Shaw, 41, a savings and loan executive, was nominated in 1963 to serve as first Negro postmaster of Los Angeles.

J. R. EYERMAN

DON CRAVENS

MATHEMATICIAN
David Blackwell, 44, professor of statistics at University of California, is authority on probability theory.

ASTRONAUT CANDIDATE
Air Force Captain Edward J. Dwight Jr., 30 (*center*), is star athlete with honors degree in engineering.

MUNICIPAL JUDGE
Vaino Hassan Spencer, 43, Los Angeles, California's first Negro woman jurist, found antifeminine prejudices stronger than racial.

ARTHUR SIEGEL

DERMATOLOGIST
Dr. Theodore K. Lawless, 71, studied at Vienna, Paris and Freiburg, is outstanding in his field, has Chicago private practice that is 80% white.

J. R. EYERMAN

JON BRENNEIS

WERNER STOY

U.S. NAVY COMMANDER

Samuel L. Gravely Jr., 41, was first Negro skipper of a Navy warship, destroyer escort U.S.S. *Falgout*, is now at War College, Newport, R.I.

JON BRENNEIS

DENTIST

Dr. Daniel Collins, 47, dental pathologist, has mixed racial practice in San Francisco, also serves on state board of education.

DEREK BAYES

EDUCATOR

Historian John Hope Franklin, 48, lectured at Cambridge, England, this fall becomes professor at University of Chicago.

BILL LAZARUS

SCHOOL BOARD MEMBER
Hattie Mae White, 47, only Negro on Houston school board, was re-elected with white support.

JIM MAHAN

FEDERAL JUDGE
William H. Hastie, 59, graduate of Amherst and Harvard Law, was first Negro federal judge. Onetime Governor of Virgin Islands, he has been mentioned for Supreme Court.

I. R. EYERMAN

CONDUCTOR
Henry Lewis, 31, shown conducting San Francisco Opera, is associate director of Los Angeles Philharmonic.

DON CRAVENS

J. R. EYERMAN

SOCIAL PSYCHIATRIST

J. Alfred Cannon, M.D., 35, went through Columbia on a football scholarship, moved to California. His patients include whites.

SPACE ENGINEER

Spencer Robinson, 38, Cornell graduate, is head of Douglas Aircraft's Advanced Space Engineering Division, supervises 250 specialists and technicians.

WALTER BENNETT

GENERALS: FATHER & SON

Air Force Major General Benjamin O. Davis Jr., 51 (West Point '36), is the son of Army's first Negro general, 86.

Key to Progress: More & Better Jobs

The main source of Negro discontent is economic hardship. Fortunately, this is the one area where progress seems most likely—more and better jobs for Negroes are on the way. Already, 115 firms have joined the Plans for Progress program backed by the President's Committee on Equal Employment Opportunity. Of 60,000 new employees they hired in the past three months, 25% were Negro. Under past practice the figure would have been only 3%.

At least 50 large firms are actively recruiting Negroes. They include A.T. & T., National Tea, IBM, Western Electric, General Electric, Standard Oil Co. (N.J.), RCA. Seven New York companies recently contributed $6,000 each to conduct an eleven-week course in grooming and confidence-building techniques to help Negro secretarial school graduates land jobs. Connecticut's Pitney-Bowes, manufacturers of mailing machines, announced a policy of preferential hiring for Negroes. In the South, R. J. Reynolds Tobacco Co. built a new plant in Winston-Salem, N.C., uses Negroes in supervisory positions over whites. Such firms as Pepsi-Cola, Schenley Industries and McCann-Erickson have Negro vice presidents.

J. R. EYERMAN

SCIENTIST
Physicist Joseph G. Logan, 53, with Ph.D. from University of Buffalo, heads Aerospace Corp.'s research lab, currently at work on Titan III.

ARTHUR SIEGEL

R TOR
A o Wright, 65, came to Cleveland with 6¢, built
u ring of gas stations, is now a millionaire.

A WORD FROM TIME'S PUBLISHER

This gallery of Negro Americans first appeared in print in TIME's issue of January 3, 1964—the same issue that announced our editors' choice of the Rev. Dr. Martin Luther King, Jr., as TIME's Man of the Year.

We are reprinting it now, for distribution to the nation's schools and colleges, for two reasons.

First, we hope it will give all students who see it a better idea of the contribution Negroes are now making to virtually every branch of the U. S. economy.

Second, we hope it will serve as an inspiration to Negro school children everywhere to see how many colored Americans are already winning success in almost every field of man's endeavor—in Government and the military, in business and the professions.

Since this portfolio first appeared in TIME, it has been reported that Negro Americans in the nation's twenty biggest cities increased the number of this group's young people in colleges and professional schools from 124,000 to 233,000 between 1947 and 1961; that this same group multiplied the number of its wage-earners making more than $4,000 a year by ten to twenty times over the decade earlier.

This is closing the gap with impressive speed—a significant and dramatic fact that should be welcome news to all Americans.
